Then Major Draper took the machine over, and in an evil moment Herr Fokker chose to come and gaze closely at the machine while the engine was being started. That settled the matter for ever. The pilot's blood was up, and never in ten years' experience of flying has one seen such an exhibition of real skill. Without ever taking a risk, without once endangering the spectators, and always in full view well out over the aerodrome, Major Draper made the little Bat do everything that an aeroplane can do. Short of turning the machine inside out, or taking it to pieces and putting it together again in the air, there was nothing left to be done. The crowd shouted itself hoarse, and the Fokker reputation faded away into the *ewigkeit*.

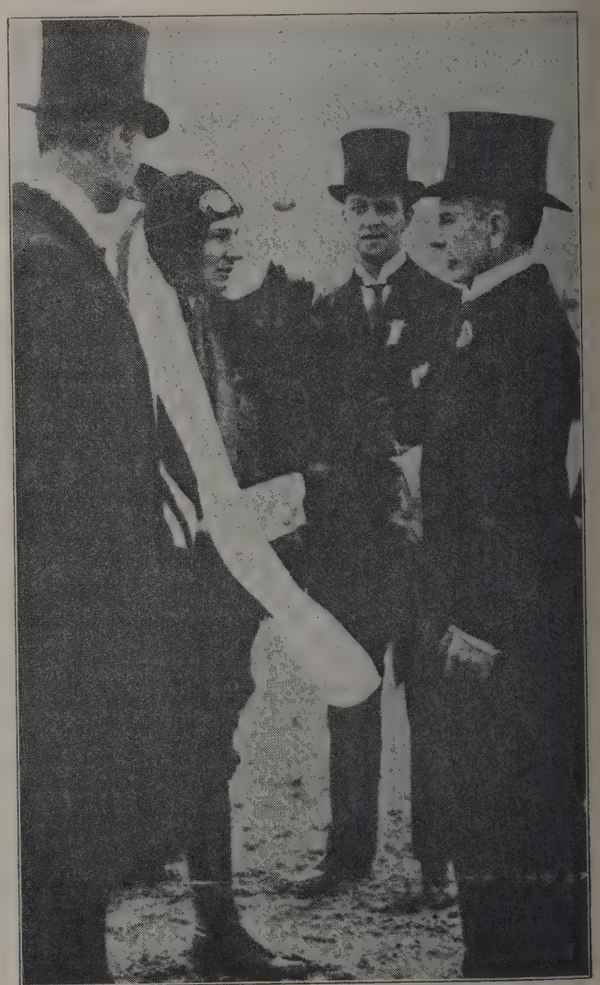
Let it be said in fairness that when Major Draper came down Herr Fokker went up to Mr. Koolhoven and said, "It is a good thing for us that those machines did not come into the war!" and he congratulated the pilot on his fine flying. It was a handsome acknowledgment of defeat. But when one considers that, only for the imbecility or knavery of the Technical Department, those same Bats might have been in the war from the middle of 1917 onwards, it makes one feel inclined to go out and assassinate somebody. Incidentally Herr Fokker was not quite a good enough sportsman to accept challenges to a flying competition sent to him by Sir John Alcock and Major Draper.

A Cause for Thanksgiving.

The contrast between the way the Germans treated the Dutchman Fokker and the way the English treated the Dutchman Koolhoven ought to be a lesson to us. And we ought to thank all our Gods that the latter has a Franco-Belgian wife and so was prevented from going to Germany. If the Germans had had the machine which we know as the Bantam Bat they would have treated our much-advertised S.E.5s in 1917-18 just as their Fokkers treated our equally advertised B.E.2s in 1915-16. Certainly the R.A.F. owes Fritz Koolhoven a debt of eternal gratitude for not becoming a German, but gratitude is all he is ever likely to get, for the Government technical official cannot forgive the man who is a better technician than he is himself. The future of the Bat aeroplane lies in international commercial aeronautics, for the Technical Department will never forgive Fritz Koolhoven for being a genius while the best men the Technical Department could produce were merely fair average journeymen-designers, and so the firm need never expect Government orders.

The Dutch Eye.

Incidentally one's visit to Holland has cleared up a mystery about those Bat machines. One could never quite place their origin. They are English enough in excellence of workmanship and construction, but there is an un-English neatness and cleanness of line about them. The journey through Holland fixed them. Mr. Koolhoven must have taken his inspiration for the big passenger machine from one of those beautiful black-and-white Dutch cows, either black with white heads or white with black heads, which cover the whole country. And the Bantam gambolling in the air reminds one of a fat little Dutch bull calf that has gone mad.



The Fokker is also essentially Dutch, but of a distinct type. Its short stubby fuselage, thick wings, and quick jerky manœuvres remind one of the little tubby high-bowed boats with brown sails which one sees on the big canals and rivers. Equally, Mr. Wijnmalen's beautifully-built Spijker biplanes suggest the unfailing eye for line and finish which produces the best buildings in Holland.

Some very good flying of the non-acrobatic kind was done by various Dutch civilian pilots, and by officers of the Flying Corps on Spijker machines, and on German machines which had been crashed in Holland and rebuilt at Soesterburg, the headquarters of the Army's aviation.

A Credit to Great Britain.

A terrific amount of hard work was done, purely for the credit of the old country, by a pair of Australian Flying Corps officers who flew a couple of 110 Le Rhône Avros to Amsterdam early in the Show. Seemingly all the Avro "joy-ride" pilots were too busy in England to go to Holland, so these two sportsmen volunteered to ferry the machines over. When they arrived they found that the Avros were expected to give joy-rides, so they set to work and carried passengers all day long. Being on the active list they could not take pay for it, but rather than let down the Avro firm before the Amsterdam public they became volunteer chauffeurs for a week or so, pending the arrival of the regular pilots.

Although they took up some fifty passengers a day there was always a queue waiting for flights, and they flew so well and safely that they did excellent propagandist work for British aviation. At times they did some "stunt" flying to amuse the crowd, and were duly presented with wreaths of honour by the Elta Committee. One of them in particular won much kudos by going up alone in the back seat of his machine and coming down in the front seat. As one was leaving Amsterdam a third Avro

arrived with two of the regular joy-ride pilots on board, but one believes that for the next two months Holland could keep a couple of dozen joy-ride machines fully occupied.

The Big Machines.

Despite the bogginess of the ground Sir John Alcock made several flights on a Vimy passenger machine, which had been flown over full of passengers and luggage by Captain Cockerell, R.A.F. The machine flies beautifully, the big streamline body making it faster and easier to handle than either the bomber or the trans-Atlantic machines—which seems to confirm Mr. José Weiss's theory that to get the best results out of a machine the cross-section of the body must bear a definite relation to the span and chord of the wings.

The little leading wheel of the Vimy saved her more than once from turning over onto her nose. Both Sir John Alcock and Captain Cockerell handled the machine splendidly, and gave the various people in high society in the Netherlands who were privileged to fly in the machine an excellent opinion of her suitability for her work.

A twin-engined Handley Page arrived about the middle of last week, piloted by Captain Meintjes, a South African Dutch pilot, formerly a star turn of the famous 23 Squadron, R.F.C., and a noted Hun-killer. He handles the big machine as well as he used to fly a scout, and made a perfect landing. As he was taxying to his shed—directed by a Dutch officer—his wheels sank into a hidden bog and the machine, after hesitating for what seemed like minutes, solemnly and slowly stood on its nose, where it remained bowing to the crowd with its nose in the sand and its tail in the air, like a Mussulman praying. It was very sad, but it was extraordinarily funny to watch.

It took six hours to get it right side up and out of the bog and into its shed, but happily it was quite undamaged, except for its wireless mast.

Late Arrivals.

Towards the end of last week various other machines began to arrive. Just as one was leaving the Show, with the cheering prospect of a 24-hour journey to London before one, Captain Lawford, R.A.F. (who will be remembered as the proprietor of a Champel biplane at Hendon before the war) drifted in happily on an Airco 9 with a Siddeley Puma B.H.P. engine, having come from Hounslow (which, with our usual intelligence, is a terminal air station ten miles the wrong side of London) to Amsterdam in three hours. Captain Saint, R.A.F., also came in on an Airco 4, having taken about the same time. General Brancker was expected some days earlier, but it was reported that he was staying a while in Brussels before coming on to Amsterdam.

No French machines arrived, which is rather remarkable, but Italy sent three excellent specimens, all of which put up a very good show.

Italy's Part.

The famous Lieut. Brack-Papa, one of the most charming as well as one of the most gallant and skilful of Italian pilots, arrived from London with that excellent little sportsman, Lieut. Buonocini, on the great 700-h.p. Fiat biplane which they flew from Rome to London in the day. So far she is the fastest publicly proved machine in the world, with her 160-mile-an-hour touring speed. The roar of that engine is a joy to hear, and Lieut. Brack-Papa handles her like an artist.

There was also a little S.V.A. two-seater which flew very well, and was cleverly handled. On Thursday a three-engined Caproni biplane arrived, making much noise, and carrying many passengers. It is not a pretty machine, and it seems to depend entirely on the pilot for its stability, but it does its job. Its turn seems to take the form of a flat spin checked by the three vast rudders after a quarter of a circle, which is terrifying but effective, for it has not fin area aft at all.

The Exhibition Itself.

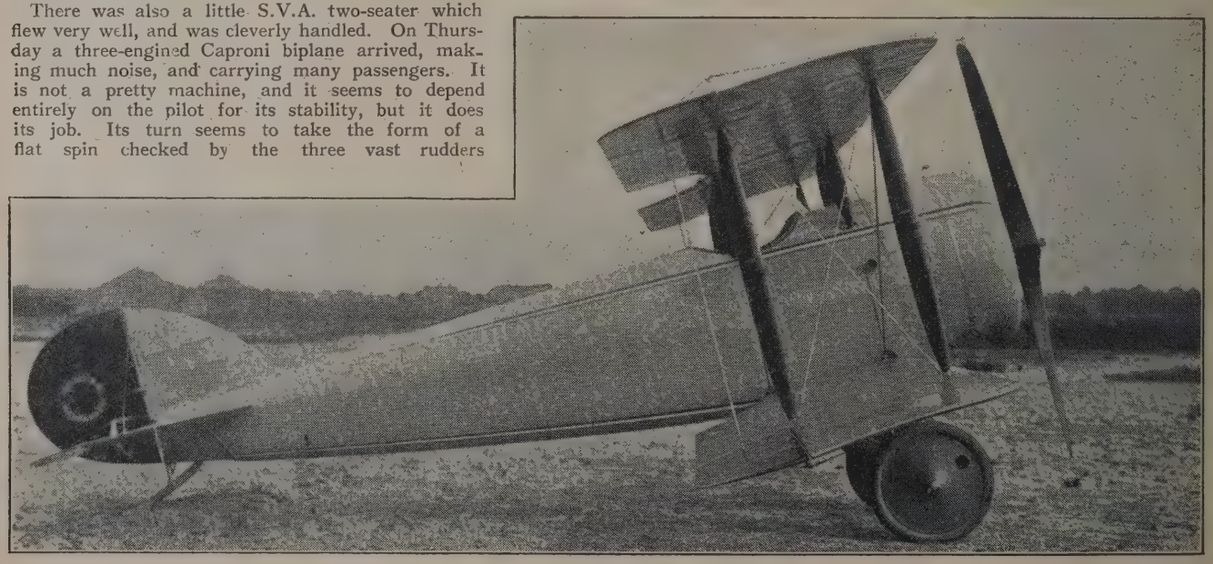
The actual Aero Show itself is very well arranged in two big wooden halls. Naturally it is not a big show, judged by the standards of London and Paris, but what there is is good. British exhibits predominate, but the Hollanders themselves make a very creditable display. Mr. Henry Wijnmalen's Spijker-Trompenburg biplane, though of conventional design, will stand comparison with the machines of any other country. He shows a single-seater scout, and a two-seater, and on his stand is a Spijker sporting model car which fills one with covetousness. A particularly neat fitting in the Spijker machines is the method of fixing the steel ribbons which are used for bracing instead of our over-rated raf-wires. The Spijker way seems just as good, and about a quarter as costly.

Herr Fokker shows a biplane and a parasol monoplane of the war type, and an ingenious folding biplane, with a Morane-type fuselage. This last is shown with the left plane folded and laid flat against the body for road transport. The tail-skid is hitched onto the stern of an Opel car (a very smart two-seater), to demonstrate how the sporting aviator may tow his machine from aerodrome to aerodrome. It is pretty, but in this country our aviators prefer to fly from one place to another.

The Royal Nederlands Navy shows a well-built Friedrichshafen seaplane, built in the naval workshops from the wreckage of a German machine which was fished out of the North Sea. It is a highly creditable piece of work.

The Royal Nederlands Army shows a cleverly designed twin-engined machine, with two 110-h.p. le Rhônes, rather on Caudron lines, built at the military aerodrome at Soesterburg, out of the material of two Sopwith 1½ strutters which were compelled to descend in Holland and partly crashed. With two 80-h.p. le Rhônes the machine flies very well, but it has not yet been tried with the 110's. The workmanship throughout is up to the high standard of all work in Holland.

The remaining Dutch exhibit is a seaplane of Brandenburg type, minus an engine, built by Van Berkel's Patent, of Rotterdam, the firm which is famous for the slicing and cutting machines so popular in hotels and cook-shops. The combination is curious. As usual, the workmanship is good.



There are a good many accessory stands showing tools, material, lamps, and so forth, but nothing of particular note except the "Picus Triplex," which appears to be a very excellent breed of three-ply wood at very much less than the price which we are accustomed to pay in this country.

The French Exhibits.

The French exhibit consists of a stand of the Messageries Aériennes—a combine of Blériot, Bréguet, Caudron, and Morane. The only machines on view are a Bréguet war machine with five machine-guns, and a Caudron, neither of new type. The Gnôme and Le Rhône Co. also have a stand.

The British Exhibits.

There are several British machines in the show. The biggest is, naturally, the four-engined Handley Page already mentioned. The next is a Vickers-"Vimy"-Rolls-Royce bomber, and on

AVIATION IN HOLLAND.—The latest type Spijker Biplane under test at Soesterburg.

the stand is the passenger cabin of a Vimy commercial machine, now improved by having a door at the back. The Vickers people also show a very neat model of their "Valentia" flying boat, and a model of a Vimy reposing inside a model of an Alban Richards hangar. Altogether it is a very taking exhibit.

The British Aerial Transport Co. show a Bantam Bat, and also a Bat "Crow," an up-to-date version of the early "Demoiselles." These machines have already been described in this paper.

The Airco had just received an Airco 4, with enclosed passenger compartment, when one was leaving. Their stand is strikingly arranged with very good paintings of Airco machines by Mr. Hill Reid, and a big model of Hendon aerodrome. A prominent feature on the stand is a Napier "Lion" engine, which attracts much attention from the motor engineers of all nations, and has produced very favourable comments.

The Gosport Co. and the Blackburn Co. both have stands, but either because of strikes or Government officials (one never knows which are hanging up industry in these days) their exhibits had not arrived when one left. The General Aeronautical Co. also have a stand, which was similarly lacking in exhibits at the time, though British Emaillite, which pertains to their business, was well represented in the show. The Palmer Tyre Co. have a good show of their famous products. Adastra Clothing is well shown, but for some curious reason the London address of the firm was not to be seen, so far as one could discover. The Marconi Co. show wireless sets for field and aerial work of all sorts. And the Farringdon Propeller Co. make a good show.

Holland's Aircraft Factory.

A very pleasing interlude in one's work at the Elta was a visit to the Spijker works, in company with Lieuts. Brack-Papa and Buonocini, at the invitation of Mr. Wijnmalen. Those who were concerned with flying in its early days will remember Mr. Wijnmalen as a singularly fine pilot of Farman biplanes. On October 1st, 1910, he beat the world's height record by reaching a height of 9,118 feet (2,780 metres) on a 50-h.p. Gnôme box-kite, so modern pilots may judge that he was an aviator of great ability. Though he is now the head of the biggest motor works and the only aircraft factory in Holland, he looks as young and is as energetic as he was nine years ago.

His works are at Trompenburg—the site of the castle of our ancient enemy, Admiral Van Tromp—and they would cheer the heart of any enthusiastic motor maker in this country. The showroom is a thing of beauty which would kill any car which was less than first class, but the cars are worthy of the showroom, for Mr. Wijnmalen is an artist as well as an engineer. Never has one seen more beautiful chassis lines nor finer *carrosserie*.

The works themselves are worthy of their products; they are exquisitely neat, they are arranged on the most modern system, everything possible is done for the health and comfort of the workpeople, and they are equipped with the latest thing in machinery—chiefly American, sad to say.

The aeroplane section of the works, which exists on orders for the Royal Nederlands Flying Corps, is on a par with the firm's motor works. The machines are thoroughly well made, and the internal finish of the parts is equal to our own best work. Though Mr. Wijnmalen has adhered to conventional lines in his designs his machines have a distinctive appearance, thanks to their typically Dutch cleanness of outline, and one feels sure that when international commercial flying develops the Spijker aeroplanes will make a big name for themselves.

After the inspection of the works Mr. Wijnmalen and his charming wife entertained the visitors with even more than that hospitality which seems to be one of the national industries of their country, and one confesses to a feeling of helpless envy after seeing the artistic treasures which he has accumulated in his house. One takes this opportunity of thanking Mr. and Mrs. Wijnmalen on behalf of their various guests from England for adding very greatly to the pleasure of their visit to Holland. It is to be hoped that ere long they themselves will come to England and afford us an opportunity of returning their hospitality.

Thanks to Elta.

Taking it all round, the promoters of the Elta may congratulate

themselves on Holland's first aero show, and none is better deserving of congratulation than is Mr. Van Der Steen, the organiser in London of the British section. Mr. Van Der Steen's energy and assiduity brought many of the best people in the Aircraft Industry to Amsterdam, and his care for their welfare when they arrived deserves the thanks of all concerned.

As one has indicated in these notes, the show is not a big show, but it is a very good show, and it is fulfilling an excellent purpose. It is interesting the international commercial men of Holland in aviation, and it is demonstrating to all and sundry that, despite strikes and Government officials, the British Aircraft Industry still leads the world in its own particular line of business.

Therefore one feels that the Elta deserves the thanks of the aeronautical community for the good work it is doing. To the President and to the Committee of the Elta one offers compliments on their success and thanks for their hospitality on behalf of all their British visitors.

C. G. G.

P.S.—As this number is going to press on Aug. 12th a telegram, sent from Amsterdam on Aug. 10th at midday, arrives stating that a Gosport flying-boat of the school training type, with a 120-h.p. British Anzani engine, had arrived at the Elta in 4½ hours' flying time from Southampton, piloted by Mr. Ash, with an engineer as passenger. So it takes two days for a telegram to get from Amsterdam to London, and 4½ hours for a little school boat to get from Southampton to Amsterdam.

THE CANADIAN AIR BOARD.

The following appeared in the issue of "Canada," dated Aug. 2nd:—

"The Civil Service Commission, Ottawa, state that a Canadian Air Board having been constituted, the following appointments have become available at the following initial salaries:—Secretary, $3,000 per annum; Superintendent of Certificates Branch, $3,600 per annum; Superintendent Government Flying Operations, $4,500 per annum; Medical Officer, $2,400 per annum. All salaries are subject to annual increase.

"These appointments would be for three years, renewable, and candidates who do not secure appointments may be eligible for other positions under the Air Board, probably including the following:—Assistant Secretary, 2 Inspectors in the Certificates Branch (1 for pilots and navigators, 1 for aeroplanes and mechanics), a Flying Officer in Operations Branch, and Equipment and Supply Officer in Operations Branch. The appointees of all positions must be willing to fly.

"Application should be made to the office of the Director of Air Services, Canadian Air Force, Oxford Circus House, London, not later than Aug. 21st, 1919."

THE ROYAL AERO CLUB.

VICE-PATRON OF THE CLUB.

H.R.H. The Prince of Wales has honoured the Club by becoming a Vice-Patron.

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS AND THE ROYAL AERO CLUB.

A meeting of the Joint Standing Committee of the Society of British Aircraft Constructors and the Royal Aero Club was held on Thursday, July 24th, 1919, when there were present:—Royal Aero Club: Lieut.-Col. J. T. C. Moore-Brabazon, M.P. (in the Chair), Lieut.-Col. F. K. McClean, Lieut.-Col. Alec Ogilvie, and Mr. Harold E. Perrin (Secretary). Society of British Aircraft Constructors: Mr. R. O. Cary, Mr Hamilton Fulton, Mr. N. G. Gwynne, and Mr. Charles V. Allen (Secretary).

CHAIRMAN.—On the motion of Mr. N. G. Gwynne, seconded by Lieut.-Col. F. K. McClean, Lieut.-Col. J. T. C. Moore-Brabazon, M.P., was unanimously elected to the Chair.

The appointment of the Joint Standing Committee was reported as follows:—

SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS.—Capt. P. D. Acland, Mr. R. O. Cary, Mr. Hamilton Fulton, Mr. N. G. Gwynne.

ROYAL AERO CLUB:—Lieut.-Col. F. K. McClean, Lieut.-Col. J. T. C. Moore-Brabazon, M.P., Mr. J. H. Nicholson, Lieut.-Col. Alec Ogilvie.

RECORDS.

It was decided that the word "Record" should not be used in any advertisement except in the case of a definite record having been granted by the Royal Aero Club.

SPECIAL COMMITTEE MEETING.

A Special Meeting of the Committee was held on Wednesday, July 30th, 1919, when there were present:—Brig.-Gen. Sir Capel Holden, K.C.B., F.R.S. (in the Chair), Mr Ernest C. Bucknall, Lieut.-Col. John D. Dunville, R.A.F., Lieut.-Col. Spenser D. A. Grey, D.S.O., R.A.F., Lieut.-Col. T. O'B. Hubbard, M.C., R.A.F., Lieut.-Col. F. K. McClean, Lieut.-Col. Alec Ogilvie, Col. C. R. Samson, D.S.O., R.A.F., and Mr. Harold E. Perrin (Secretary).

GOLF.

A golf match between the Royal Air Force Club and the Royal Aero Club took place at Worplesdon on Tuesday, July 29th, 1919. The morning's play resulted in the Royal Air Force Club being defeated by 6 matches to 1. The afternoon was given up to four-ball matches, in which the teams finished "2 all." The Royal Aero Club won, therefore, on the day's play by 8 points to 3.

THE FLYING SERVICES FUND.

(Registered under the War Charities Act, 1916.)

ADMINISTERED BY THE ROYAL AERO CLUB.

For the benefit of Officers, Non-Commissioned Officers and Men of the Royal Air Force who are incapacitated while on duty, and for the widows and dependants of those who are killed or die from injuries or illness contracted while on duty.

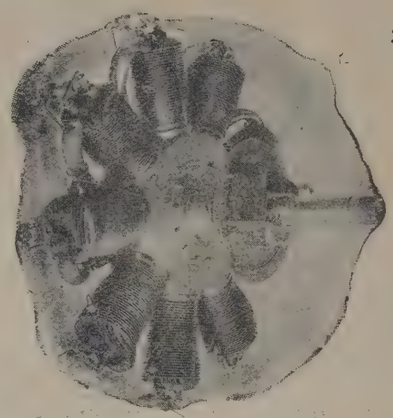
NEW FOR OLD TITLES.

Will the Invention of Rank Titles Department of the Air Ministry please give rulings on the following points?

(a) If an R.N.A.S. officer was invalided out or was permitted to resign, as a squadron commander, before the R.A.F. was formed, or if an R.F.C. major left the corps under similar conditions, does he now become a squadron leader on his visiting cards or not?



(b) If an R.A.F. officer has left the Service as a major does he become a courtesy squadron leader, and if he left as a captain does he become a courtesy flight-lieutenant? Similarly, do retired colonels, R.A.F., become courtesy group captains?

(c) As demobilised officers who are on the unemployed list have not had their commissions cancelled they are still in the R.A.F. Must they therefore adopt the new R.A.F. titles, and are they committing a punishable offence if they stick to their old military titles?

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

In an article on "Aerial Propulsion," Capt. W. H. Sayers discusses the inefficiency of the method now employed in the propelling of aircraft.

He shows that the heat energy of burning fuel is used directly to set gas in motion, this motion is communicated by a complicated mechanism to the airscrew, finally to set in motion once more another body of gas—the airscrew slipstream.

The turbine is considered as a simplification of the chain of mechanism between the first and the final stage.

A new passenger-carrying machine designed and built by the Westland Aircraft Works for commercial purposes is described in this issue.

The Handley Page multiple-engine machines of the O/400 and the V/1,500 types are described in this week's instalment of the series on "Modern British Aeroplanes."

A letter from M. L. P. Frantzen describes the French Couade tandem parachute system of 1913, which bears a close resemblance to the tandem parachute system described by Lieut.-Col. Holt in recent issues of this paper.

AERIAL PROPULSION.

By Capt. W. H. SAYERS, late R.A.F.

The future of the aeroplane as a commercial vehicle is to a very large extent dependent upon the cost of operating aerial services.

Whether the aeroplane remains as it now is, a costly method of transport, or whether it can be made cheap to build and to run, it undoubtedly has a future.

Unless the world at large relapses into mere savagery, there will always be occasions upon which the saving in time on a journey, which the aeroplane alone can secure, will be of greater value than the cost of thus saving it.

If, on the other hand, aerial transport can be made really cheap and at the same time safe and reliable, then its uses will be enormously extended.

Practically the whole question of the cost of aeroplane travel is a question of the method of propulsion.

The prime cost of an aeroplane of any normal type is very largely composed of items relating to the propelling plant.

The Direct and Indirect Cost of Power Plant.

In very few modern machines does the cost of the aeroplane itself, without engine, fuel tanks, radiators, airscrews, and the instruments and controls incidental to the power plant, exceed one half of the total cost of the machine with these items installed.

Of the cost of maintaining an aeroplane in service, at least 50 per cent. is directly chargeable to the cost of power plant overhaul and maintenance, and with present-day machines the weight of engines and their accessories, together with fuel and oil, is always very much greater than that of the useful or paying cargo which can be carried.

Of the actual cost of running an aeroplane over any given stage, fuel and oil account for no inconsiderable proportion.

Finally, apart from accidents caused either directly or indirectly by failure of the propelling mechanism, the aeroplane is probably the safest type of vehicle in existence.

Thus the importance of improving upon the present methods of propelling aeroplanes cannot be exaggerated.

It is well worth while to consider in some detail the chain of processes which in the aeroplane convert the latent energy of the fuel into a propulsive effort.

A Complex Cycle.

In the first place, the fuel, mixed with an appropriate amount of air, is burnt, raising the temperature of the products of combustion to a great extent, and causing them to expand. In so expanding, this gas drives before it a piston, which in its turn, through the connecting-rod, drives round the crankshaft.

The crankshaft by its rotation causes the airscrew to revolve, and the airscrew reacts upon the air in which it works and drives backward from the aeroplane a column of air.

The actual propulsion effort exerted upon the aeroplane is equal, and in the opposite direction, to the force which is exerted upon the air driven backwards, and which serves to put it in motion.

Thus the process begins with the setting in motion by the application of heat of a mass of fluid. This motion is in turn converted into a linear movement of the piston, a rotary motion of crankshaft, airscrew, and finally into a more or less linear movement of a further mass of fluid.

In each of these changes in the nature of the movement there is a loss of some of the original energy of combustion.

In the first place, of the heat energy liberated at combustion some large proportion is absorbed in heating cylinders and pistons, and is carried off by the cooling water and air. Secondly, the heated gas within the cylinders is liberated long before it has given up all its heat energy, and is allowed to escape, carrying the remnant with it. Some 55 per cent. or more of the total heat energy of the fuel is thus lost.

In the translation of the linear motion imparted to the piston into the rotary motion of the crankshaft there are frictional losses. In addition to those which occur in the actual translation there are losses involved in driving the valve gears, oil and water pumps, and magnetos, which have to be deducted from gross

power delivered by the piston to the crankshaft. In such ways some 10 per cent. of the energy delivered to the piston, or 5 per cent. of the fuel heat energy, is dissipated.

Thus at the most 40 per cent. of the total stored energy in the fuel is available at the crankshaft end for driving the airscrew.

In the final translation of the rotary motion of the crankshaft to the linear motion of the slipstream, by the airscrew, there is a further loss of at least 20 per cent. of the net output of the engine, or 8 per cent. of the original energy of the fuel.

A Low Efficiency.

Thus the overall efficiency of the propelling mechanism of the aeroplane is not more than 32 per cent. In practice this figure is never reached. It is based upon a combination of the best possible results right through the whole cycle of propulsion.

Probably 28 per cent. overall efficiency is about as high as can be relied upon under practicable conditions.

Since an aeroplane in flight is entirely immersed in the air, and has no connection with any other body, there is obviously no other abutment against which a propelling force can act. As the air is fluid, any force applied to it will set it in motion, and it is not possible to propel an aeroplane without driving a current of air astern, not merely relatively to the aeroplane, but relatively to the whole body of air.

The propulsive effort obtained by so driving a current of air astern depends upon the mass of air affected and the speed of the current. Thus an airscrew which drives an air current astern at 32 ft. per second will give a thrust of one pound for every pound of air which passes through it per second. If the air speed of the aeroplane to which the airscrew is attached be 88 ft. per second, the slipstream velocity past the aeroplane must be 88 + 32 or 120 ft. per second to keep the thrust to that value.

If the slipstream velocity relative to the aeroplane is reduced to 104 ft. per second, making the real velocity of the air current 16 ft. per second, a thrust of only half a pound for every pound of air passing the airscrew per second is obtained.

The stream of air moving astern has, in virtue of its motion, kinetic energy, which has to be supplied by the engine driving the airscrew. Thus a certain amount of the engine power is necessarily expended in propelling air instead of propelling the aeroplane.

For any given thrust the amount of this loss is entirely dependent on the relative velocity of the slipstream to the general body of the air.

Thus with a slipstream having an absolute velocity of 32 ft. per second the loss is 1 × 32 = 32 ft.-lbs. per second = 32/550 = 0.058 h.p. per lb. of thrust obtained.

With the absolute slipstream velocity of 16 ft. per second the loss is only 16 ft.-lbs. per second = 0.029 h.p. per lb. thrust, although twice as much air must be set in motion to give that pound of thrust.

The Real Problem.

Thus the problem of aeroplane propulsion is to provide a stream of air of the greatest possible mass, or cross-section, and moving, relatively to the undisturbed air around, at the least possible velocity.

In its present form the airscrew can be made to give efficiencies up to 80 per cent., but, except for machines of very much greater speeds than have at present been reached, there is little likelihood of any great advance. As a device for transforming rotary motion into a propulsive effort there is little hope of greatly improving upon the airscrew as it is now known.

The internal combustion engine converts the heat energy of the fuel into energy in a form suited to the driving of the airscrew with an efficiency of rather less than 40 per cent. Here again there is little prospect of, if much room for, any great improvement without an entire change in the type of engine used.

The idea of using some form of turbine in place of the reciprocating engine has many attractions.

A Real Simplification.

The turbine in effect cuts out two of the transformation steps in the conversion of the energy of expanding gas into the energy of rotation of the engine shaft. The hot gas is allowed to expand in flowing past the blades of the turbine wheel, and in so flowing gives up part of its kinetic energy directly to the rotating blades. It is thus possible to avoid many of the mechanical losses which are inseparable from the reciprocating engine.

Also, the turbine promises a large reduction in weight as compared with the reciprocating engine.

So far, though there are certain rumoured experimental productions, no internal combustion turbine is doing practical work. In any form the steam turbine is scarcely a practicable aero-engine.

The best steam turbine fuel consumption per h.p.-hour still exceeds that of the petrol engine to a very appreciable extent. The weight of water which must be evaporated is something like 10 lbs. per h.p.-hour, and, although this can be condensed and returned to the boiler after exhaust, a certain loss occurs in the process. To make up for this, a weight of water probably not less than half a pound per h.p.-hour will have to be carried as a "make-up."

Thus water and fuel together will weigh at least twice as much as the fuel and oil required for a petrol engine of equal output.

In addition, the steam turbine loses immensely in efficiency unless a very high vacuum is maintained at the exhaust outlet. This calls for large condensing plant and air pumps. Condensers may be made light by air-cooling them. Unfortunately an enormous surface is needed, and the head resistance would then become excessive. Altogether, steam plants do not appear to have any very great future.

An Experimental Effort.

There has been suggested, and it is understood that experiments are to be made with, a type of turbine generally similar to the steam turbine of commerce, but employing the vapour of some fluid other than water.

This fluid is preferably to be an inflammable one, with a considerably lower boiling point and a lower latent heat of evaporation than has water.

Owing to the low latent heat, it is hoped that condensers small and light compared with those needed for steam will suffice, and it is proposed to use a small proportion of the exhaust as a fuel in the boiler.

It is hoped that by such methods it may be possible to produce large power plants which shall not exceed either in plant weight or in fuel consumption petrol engine plants of equal output, and which will be very much more reliable than are these.

The author must confess that he does not see any great likelihood of success along such lines.

Putting an inflammable liquid into a boiler and vaporising it does not sound a particularly safe proceeding, particularly in an aeroplane, and the prospects of greatly reducing the total weight to be carried for power plant and accessories seem remote.

However, the scheme is being considered by a firm of the highest standing in the engineering world, with a very large turbine experience, so that it may fairly safely be presumed that the scheme has advantages as yet undisclosed to recommend it, and the fact that any such experiment should be put in hand in earnest is at least a hopeful sign.

(To be continued.)

THE "WESTLAND LIMOUSINE."

Three-quarter View from Rear of the "Westland Limousine" (Rolls-Royce "Falcon" engine).

Of the numerous engineering firms which during the war have undertaken the manufacture of aircraft, Petters, Ltd., of Yeovil—known as regards their aeroplane department as the Westland Aircraft Works—have taken a prominent place. Their aircraft products have gained for themselves a uniform and high reputation for excellent workmanship and finish.

The success of their efforts at producing machines to official specification encouraged them to proceed to original design work, and they have built, for war purposes, the experimental seaplanes N.16 and N.17, the Westland "Wagtail" and the Westland "Weasel," all of which have given excellent results.

Messrs. Petters' experience of war aeroplane building has left them with a firm confidence in the future of aviation as a means of transport, and the firm has determined to develop aircraft for commercial transport services.

At the invitation of the company, representatives of the Technical Press were given on July 31st, an opportunity of inspecting and making trial flights in the first of the firm's machines designed for commercial work.

This—which is to be known as the "Westland Limousine"—is a small four-seater passenger-carrying machine, designed for the use of business men and the like to whom time is of value, but who wish to travel in reasonable comfort.

In so far as its aerodynamical features are concerned, the machine is a perfectly normal tractor biplane.

The fuselage is a totally enclosed affair containing four seats. Of these the after one on the port side is raised above the cabin floor some 2 ft. 6 ins., and has above it an opening into the outer air. This is occupied by the pilot, and is fitted with the usual controls.

The three remaining seats are at a lower level, so that the occupants are entirely within the fuselage.

One seat is beside that of the pilot, facing forward, and the remaining pair, in the front end of the cabin, face one forward and one back.

The passenger cabin, which forms one unit of the three comprising the fuselage, is a three-ply and timber structure, free from all internal crossbracing, and has at its for'ard end a double bulkhead of three-ply with an asbestos filling between, which acts as an insulation against both the heat and the noise of the engine.

The engine exhaust is carried back past the pilot by long exhaust pipes, and the cabin is fitted with a ventilator, adjustable from within, which allows air from the slip stream to enter at the for'ard end and pass out by the pilot's cockpit.

The interior of the cabin is upholstered in the style characteristic of the very finest class of motor-car bodies, the seats are extremely comfortable, and there is ample leg room.

Conversation can be carried on with ease, and although there are no draughts, there is no trace of odour from the engine.

After a fairly long experience of flying in open machines the writer must confess to a feeling of discomfort when flying in the totally enclosed cabin of this machine.

The discomfort is by no means uncommon, and is probably due to the fact that though one knows that one is flying, one misses most of the accustomed sensations of the sport.

It is, in fact, very terrifying to miss that comforting 100-mile an hour blast straight in the face that assures one that though the earth is apparently trying its hardest to fall on one from the side it will not succeed, and a muffled kind of moan is a poor substitute for the healthy roar that tells of 12 cylinders all firing regularly.

Thus the feeling is, in fact, a measure of the designers' success. It can certainly be said that the "Westland Limousine" is considerably more comfortable to travel in than was the dining-car upon which the return journey from Yeovil to London was made.

There was no more noise, considerably less oscillation—and that under very bumpy weather conditions—certainly less smell, and considerably less of that leg-cramping effect which is common to railway carriages and theatre seats.

To the front end of the cabin structure ahead of the bulkhead are affixed beams for fuel tanks and the engine mounting.

The latter is in this case an affair of steel tubes arranged to carry a Rolls-Royce "Falcon" engine. The whole structure is removable, and engine mountings for other types of engine may be fitted without any structural alterations to the cabin unit.

The rear part of the fuselage is of the usual wire braced construction.

Very great care has been taken over the engine installation to secure cleanliness.

The whole body is painted in a very pleasing shade of grey—one which would easily rival "Bolo blue" in its capacity for showing dirt.

Upon the arrival of the party at the aerodrome the machine had the appearance of having just left the paint shop. At the end of the afternoon—after four or five flights—of a total of probably an hour and a half, it was impossible to discover any sign of oil or dirt about the body.

As a demonstration of the conditions prevailing within the cabin, one of the typists from the works office, complete with note-book and typewriter, made a flight in the machine. Whilst in the air letters were dictated to her and were successfully typed.

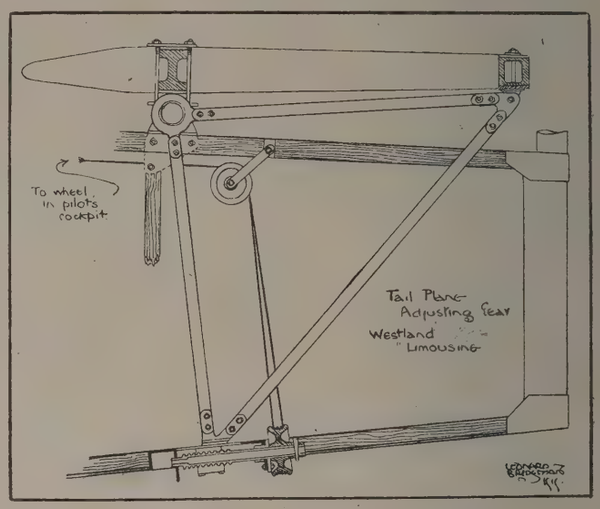
This particular demonstration was partially marred by a hitch which would appear to demand the immediate attention of the Department of Civil Aeronautics. The ground staff at the aerodrome appear to have been totally inexperienced in the erection and truing up of typewriter machines, and, on the first trial, it was found that insufficient clearance had been allowed for the operation of the shift key. Quite a number of otherwise excellent letters were thus deprived of their Capitals, and unless a new department is immediately formed to supervise the installation of aerial typewriters, a number of accidents even more serious may occur.

By the removal of the upholstery and the seats the "Limousine" may be converted to a mail-carrier. There is available about 95 cub. ft. of space, and the machine would carry comfortably from 500 to 600 lbs. of goods.

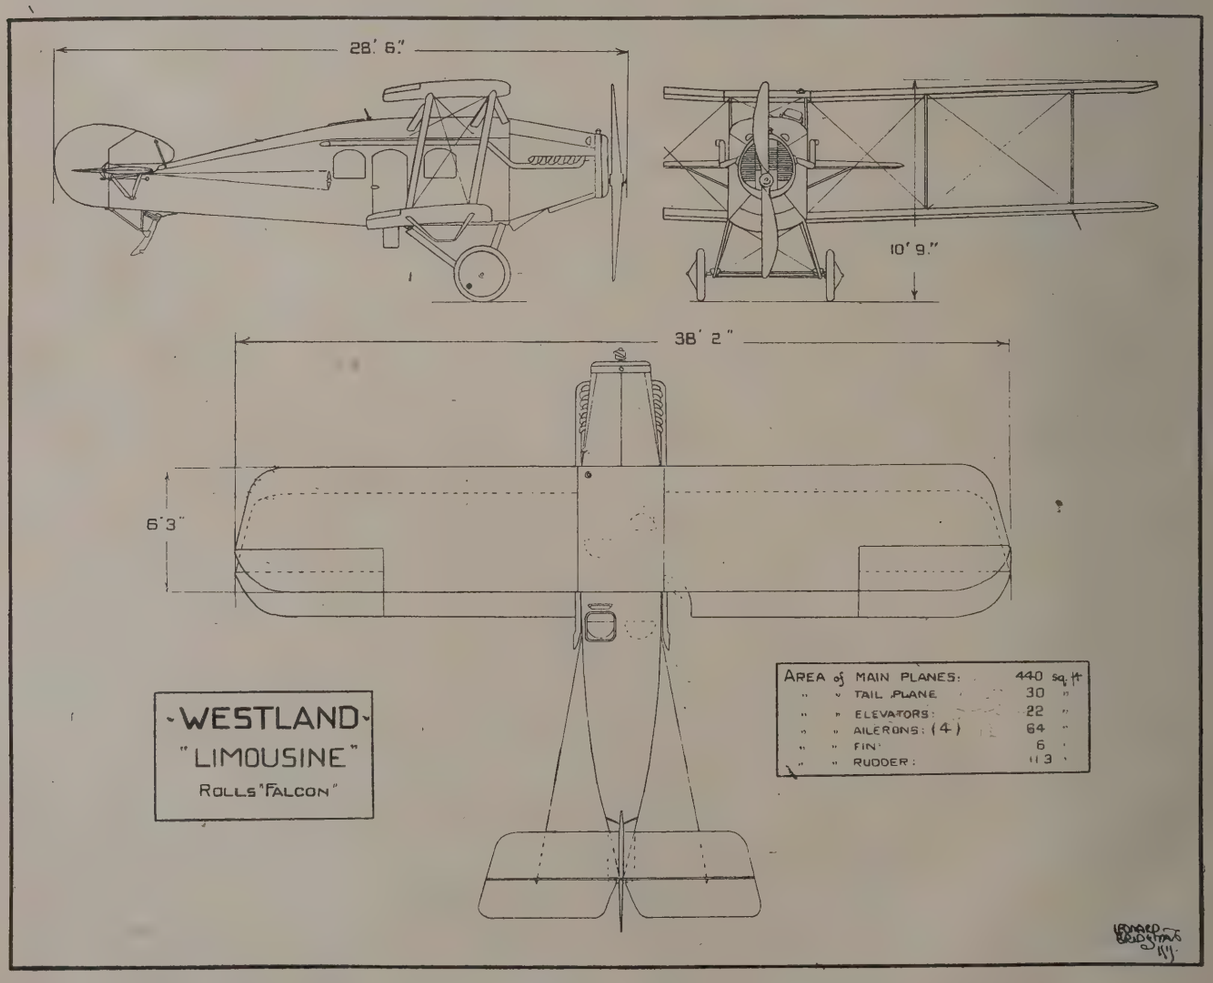
The "Westland Limousine" in the Air.

A careful observation of the pilot's actions in the air leaves no room for doubt that the machine is in excellent balance, and is both light and quick in answering its controls.

Altogether, the machine reflects great credit upon the enterprise of its makers and upon its designers, Mr. R. A. Bruce, the managing director, and Mr. Davenport, the chief draughtsman, of the Westland Aircraft Works.



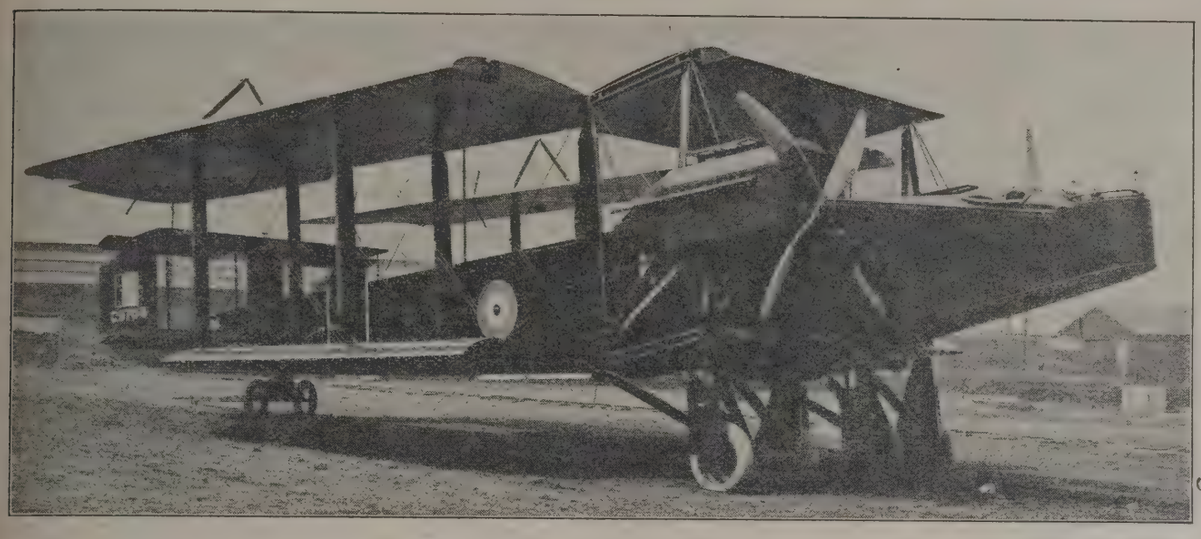
Amongst the noteworthy details of construction the tailplane adjustment gear, which is illustrated herewith, is of interest. The mechanism is covered by a patent, and the essential feature is the complete and simple triangulation of the tailplane bracing which is secured.



At the conclusion of the visit, Mr. F. W. Petter, one of the joint managing directors of Petters, Ltd., in a short speech, expressed the confidence of the firm in the future of commercial aviation, and their determination to take an important part in that future.

To him, to Mr. Chandler, the works manager, of the Westland Aircraft Works, and to Capt. Keep, M.C., late R.A.F., the firm's very able pilot, one must express one's thanks for a very pleasant and a very interesting day.

The attached specification gives all the main particulars of the Westland "Limousine."



Length overall	28 ft. 6 in.
Span	38 ft. 2 in.
Chord	6 ft. 3 in.
Gap	6 ft. 0 in.
Stagger	1 ft. 0 in.
Total wing area	440 sq. ft
Dihedral angle	2 deg.
Total aileron area	64 sq. ft.
Area of tail plane	30 sq. ft.
Area of elevators	22 sq. ft.
Area of fin	6.0 sq. ft.
Area of rudder	11.3 sq. ft.
Engine	Rolls-Royce "Falcon."
Weight, empty	2,010 lbs.
Weight, loaded	3,226 lbs.
Weight, useful load	540 lbs.
Fuel capacity	3 hours.
Loading	7.8 lbs. per sq. ft.
do.	15.6 lbs. per h.p.
Performance—	
Speed low down	100 m.p.h.
Speed 10,000 ft.	91 m.p.h.
Speed 15,000 ft.	85 m.p.h.
Climb—	
5,000 ft.	8.35 mins.
10,000 ft.	19.6 mins.
15,000 ft.	37.5 mins.
Ceiling	17,000 ft.

MODERN BRITISH AEROPLANES.

XI.—Handley Page, Ltd.

The twin-engined Handley Page Type O/400 Biplane with wings folded (two 375 Rolls-Royce "Eagle" engines)

Mr. F. Handley Page is one of the earliest British experimental aircraft constructors. Originally—like quite a number of others of the pioneers of aviation in this country—an electrical engineer, Mr. Handley Page abandoned this profession *circa* 1908, and founded the firm of Handley Page, which became Handley Page, Ltd., in 1909. At their works in Barking they produced the extraordinarily successful two-seater monoplane with a 50 Gnôme engine, which was affectionately known as the "Yellow Peril," the 70 Gnôme-engined monoplane of the 1912 Military Trials, and the 1914 Handley Page biplane. All these machines were fitted with wings which followed upon the lines of the wing of a bird, both in plan form and in section, and they were all of them possessed of a very considerable degree of inherent stability.

During the early stages of the war, Handley Page, Ltd., were confined to building aeroplanes to official specification.

Towards the end of 1915 they produced the first of the now famous twin-engine H.Ps., and since then have been entirely engaged upon the production of this and its elder brother, the four-engined type V/1500 machines.

THE HANDLEY PAGE TWIN-ENGINED BIPLANE.

The Handley Page twin-engined biplane o/400 type was designed and built in 1915 as a bomber, but was not adopted as a service machine until 1916, when the R.N.A.S. commenced their heavy night raiding along the Belgian coast.

The machine follows the usual practice in twin-engined biplanes in having a centre fuselage with the pilot's cockpit situated in advance of the leading-edge of the main planes and the two observers' cockpits are one right in the nose and the other in rear of the main planes.

The two engines are carried in streamline nacelles between the planes on the first pair of interplane struts driving two tractor airscrews.

The upper plane has a considerable overhang which is braced above and below from a pylon over the last set of struts and the bases of the last sets of struts respectively.

The tail unit is of the biplane type and has two rudders. Two separate undercarriages are carried, one on either side of the fuselage, and each consists of three Vees attached to a stub skid, the axle being supported by oleo-pneumatic shock-absorbers as shown in the photographs.

Since the armistice the o/400 type has been converted for commercial and passenger-carrying work by having the central internal bomb racks and back observer's cockpit removed, the resultant space being fitted up with seats.

SPECIFICATION.

Type of machine	Biplane.
Name or type No. of machine	o/400.
Purpose for which intended	Night bombing.
Span	100 ft.
Gap, maximum and minimum	11 ft.
Overall length	62 ft. 6 in.
Maximum height	22 ft.
Chord	10 ft.
Total surface of wings	1,630 sq. ft.
Maximum cross section of body	6 ft. 10 ins. × 4 ft. 9 ins.
Engine type and h.p.	2 R.R. "Eagle VIII." Standard equipment.
Airscrew, diam., and revs.	11 ft. diam., 1,080 r.p.m.
Weight of machine empty	8,200 lbs.
Load per sq. ft. fully loaded	8.5 lbs.
Weight per h.p.	20 lbs.
Tank capacity in hours	8½ hours.
Tank capacity in gallons	300 gallons.
Performance—	
Speed low down	97 m.p.h. fully loaded.
Speed at 6,500 feet	95 m.p.h.
Speed at 10,000 feet	93 m.p.h.
Landing speed	50 m.p.h
Climb—	
1,000 ft. per min. lightly loaded	
To 5,000 feet	10 mins.
To 10,000 feet	25 mins.
Disposable load apart from fuel	3,500 lbs.
Total weight of machine loaded	14,000 lbs.

ALTERNATIVE ENGINES.—2 "Liberty's," 2 "Sunbeam Maori," 2 "Sunbeam Cossack," or 2 "F.I.A.T.," etc.

THE HANDLEY PAGE FOUR-ENGINED BIPLANE.

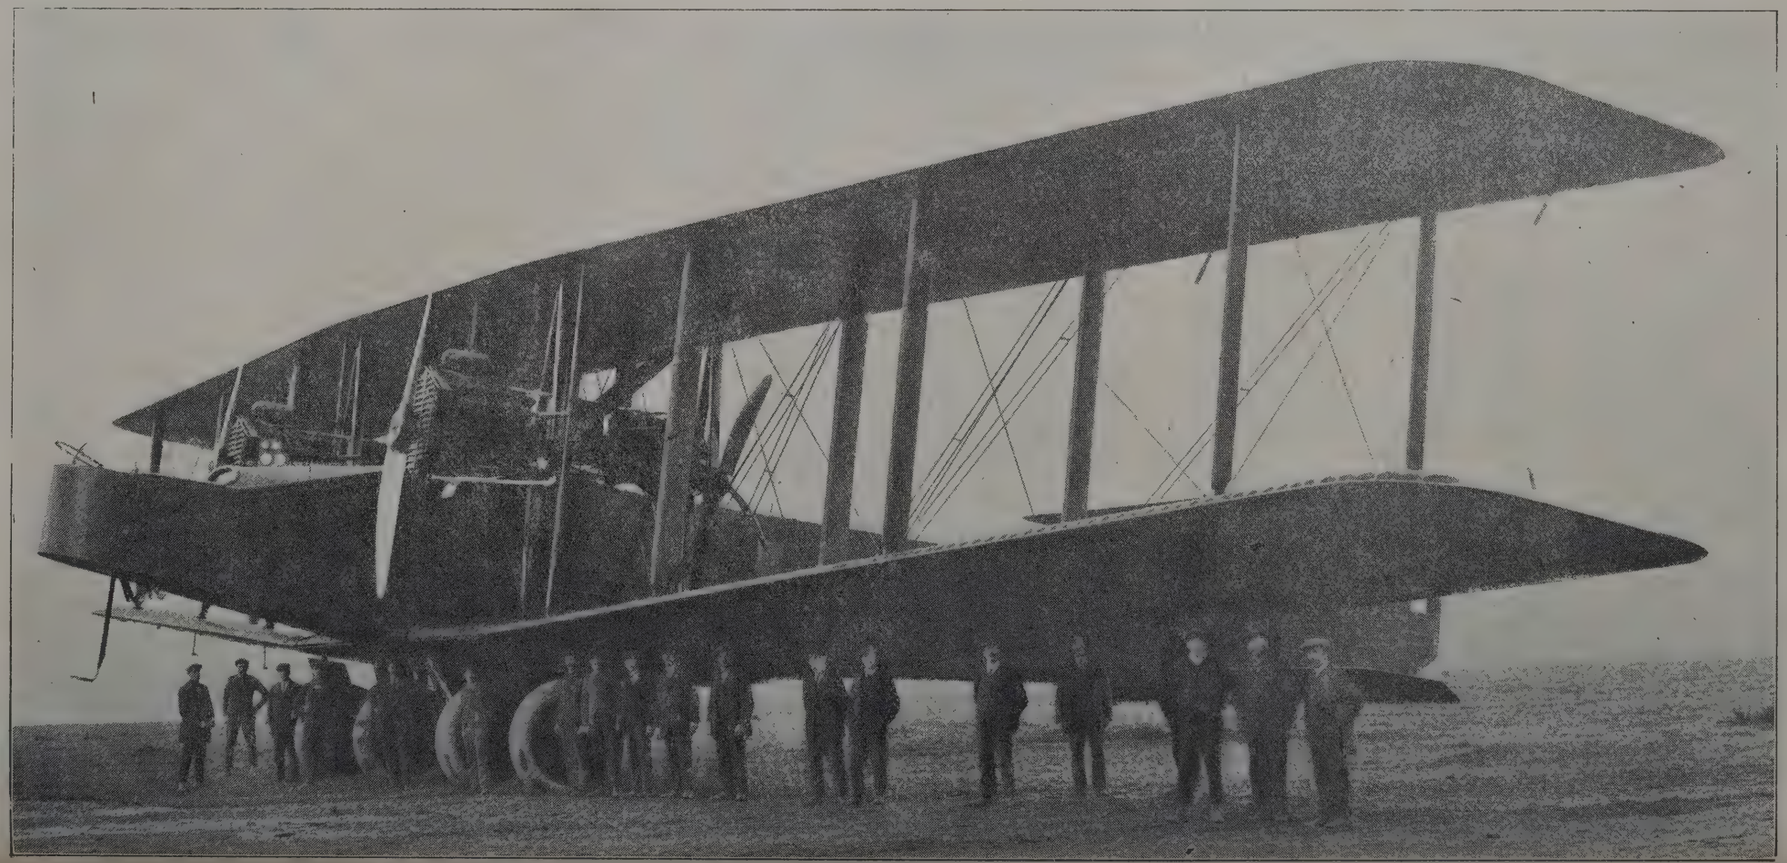
The Handley Page 4-engined biplane, type V1500 is a development of the smaller o/400, the principle alterations being the increase of dimensions all round, with exception of the length, the

The four-engined Handley Page in the Air.

abolition of the overhang by increasing the span of the lower plane and the addition of two engines, which are carried tandem-wise to the two front engines in the same nacelles, the front engines driving two two-bladed tractor airscrews and the rear engines two four-bladed pusher airscrews. The fuselage is almost identical with the smaller edition but is much deeper towards the rear end.

The undercarriage and tail-skid are of a simpler form, as can be seen in the photographs.

These machines can be converted to commercial vehicles by the mere elimination of the military apparatus—bomb gear and guns—and the refitting of the interior of the fuselage for the accommodation of passengers and/or goods.



In the event of passengers, mails and goods all being carried by the same machine, each would be conveyed in a separate compartment.

SPECIFICATION.

Type of machine	Biplane.
Name or type No. of machine	V/1500.
Purpose for which intended	Night bombing.
Span	126 ft.
Gap, maximum and minimum	15 ft.; 12 ft.
Overall length	62 ft.
Maximum height	23 ft.
Chord	12 ft.
Total surface of wings	3,000 sq. ft.
Maximum cross section of body	8 ft. × 6 ft. 2 ins.
Engine type and h.p.	4 R.R. Eagle VIII.
Airscrew, diam., and revs.	13 ft. 5 ins.; 10 ft. 4 ins.; 1,080; 1,080.
Weight of machine empty	15,000 lbs.
Load per sq. ft. fully loaded	10 lbs.
Weight per h.p.	21 lbs.
Tank capacity in hours	14 hours.
Tank capacity in gallons	1,000 hours.
Performance—	
Speed low down	103 m.p.h. fully loaded.
Speed at 6,500 feet	99 m.p.h.
Speed at 10,000 feet	95 m.p.h.
Landing speed	50 m.p.h.
Climb—	
1,200 ft. per min. lightly loaded	
To 5,000 feet fully loaded	8 mins.
To 10,000 feet	21 mins.
Disposable load apart from fuel	7,000 lbs.
Total weight of machine loaded	36,000 lbs.

Alternative Engines.—

4 B.H.P. "Atlantic's," each 500 h.p., or 4 Napier "Lion's," or 2 R.R. "Eagle" and 2 "Liberty" (400 h.p.).

To "Aeroplane" Subscribers.

Since the Armistice, the subscription list of the AEROPLANE has steadily increased: an eminently satisfactory development which we are anxious to encourage.

Of the many books published on the war on the Western front, none conveys a more realistic impression of the work of a particular arm than FLYING COLOURS by Captain H. M. S. Saundby, A.F.C., R.A.F., M.C., published at **£2 2s.** net (Edition de luxe) and **15/-** net (Popular Edition).

Among the art books published in the last year or two, none can claim to be a more faithful reproduction of the artist's colour scheme and that indefinable thing atmosphere.

FLYING COLOURS is a permanent memorial of the life of "the pilot in action," as Major-General C. B. Ashmore calls him. It was very costly to produce, and necessarily the price to the public had to be high.

Many would like to possess it who do not feel disposed to put down Two Guineas for the larger edition or Fifteen Shillings for the smaller.

How to meet their views? We make a special offer to any subscriber for one year to the AEROPLANE: namely to give him the right to purchase either edition at half price.

All he need do is to send us the accompanying order form with cheque for one year's subscription, plus **£1 1s.** or **7s. 6d.** according to the Edition he wishes to have.

In order to be fair to current yearly subscribers we extend the half-price concession to them also. If a subscriber has paid a quarterly or half-yearly subscription, then to secure the right to participate he should send the balance for the year.

Subscribers who have given their orders through the trade, and not direct to the AEROPLANE Office, must sign the form below or a copy thereof, and hand it with the balance on account of the book to their retailer for transmission to the AEROPLANE.

If the subscriber already has a copy of FLYING COLOURS, and would wish to take advantage of this offer, then he may secure McCudden's "Five Years in the R.F.C." **(7s. 6d.)**; Richthofen's "Red Air Fighter" **(3s. 6d.)**, and Gill's "The Aerial Arm" **(6s. 6d.)** at half price, *i.e.* **8s. 9d.** the three, plus the year's subscription to the AEROPLANE.

ORDER FORM.

To THE "AEROPLANE,"
61, Carey Street, W.C.2.

Please send me the "AEROPLANE" for one year post free **(30/- inland; 35/- abroad)** and one copy of the { Edition de luxe / Popular Edition } of FLYING COLOURS at half price { **£1 1s. 0d.** / **7s. 6d.** } for which I enclose remittance value **£ s. d.**

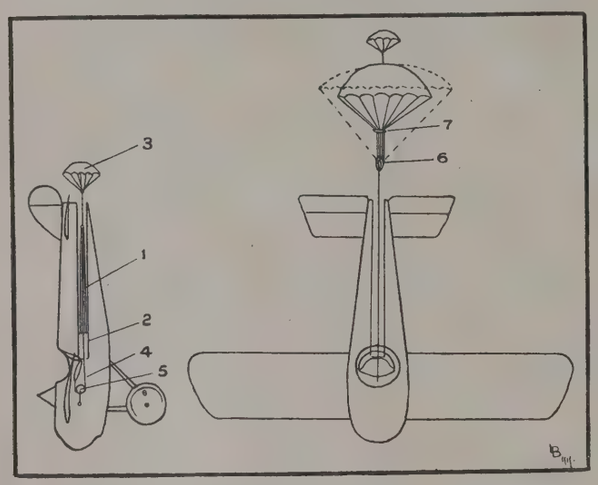
TANDEM PARACHUTES.

The following letter has been received :—



Sir :—In the very interesting series of notes on parachutes which have recently appeared in your excellent journal, Lieut.-Col. Holt has described the arrangement of a tandem parachute system wherein a parachute of small diameter is first released and serves to draw out the main parachute. This idea is excellent, but it is not novel. Several investigators have suggested it since 1910, and in 1913 Lieut.-Col. (then Captain) Couade, of the French Army, had already used this system.

On Oct. 2nd, 1913, a note describing the Couade Sloan parachute was communicated to the French Academy of Sciences by M. Léon Lecormi (Comptes Rendu Acad., t.C.L. VII, page 167).

This descriptive note gave a number of results obtained with the arrangement which had been tested in model form by Capt. Couade in collaboration with M. Sloan, who may be remembered as the inventor of a curious aeroplane (circa 1910) known as the Sloan Bicurve.

The following extract describes the features of the Couade system, which could not only be used for saving the pilot from danger, but which it was proposed to employ for salving the complete aeroplane :—

" The parachute (1) is fitted within a tube (2) placed in the fuselage which emerges behind the control surfaces of the tail, and it

(the parachute) has attached to its summit a small ' tractor ' parachute (3) fitted with elastic ribs, which alone projects beyond the tube.

" This ' tractor ' is normally held closed, but may be freed when necessary by the pilot. It then draws from its case the main parachute and brings it out into the air current. This then opens in its turn without any risk of its unfolding being interfered with.

" The surface of the parachutes is designed to allow a fall at the rate of 6 m. 50 per second.

" In order to avoid dangerous accelerations which would be caused by a sudden opening of the parachute when the machine is travelling at a great speed were the parachute directly attached to the machine, there is interposed between the two a cable (4) which passes round a brake (5). The acceleration cannot then exceed the effort applied by the brake. A shock absorber (6) is fitted which relieves the parachute of the effects of a brusque action on the part of the brake.

" In order to reduce the slip past the brake, the parachute is arranged to open in two stages.

" This is accomplished by a tie (7) which holds the suspension ropes together in their middle.

" The parachute opens partially, and when the load on 7 reaches a certain value this tie ruptures and allows the complete opening.

" For high speeds of fall (50 metres per second) the parachute should open completely within 100 metres."—L. P. Frantzen.

BY ERROR.

In the article by M. L. P. Frantzen on "Aerial Safety and the Aeroplane Parachute," published in this paper on July 23rd, two unfortunate errors occurred.

The Couade parachute system was referred to as the Conade (page 317), and on page 318 René Lallemand was described as Roger Lallemand.

TECHNICAL KNOWLEDGE.

Following are some questions and answers collected by an instructor of R.A.F. Cadets :—

How is a machine supported in flight?—By flying wires.

What is the object of a tail plane?—It is fitted for stabling purposes.

What is propeller torque?—When the propeller is loose on its boss and rattles.

How does a machine get into a glide?—By gravity acting through the propeller boss.

How is rotary motion obtained in a rotary engine?—By means of two eccentric circles.

What is the construction of the crankcase of a mono?—It is made of clamped iron filings.

What are the chief points of a R.A.F. engine?—It has crinkly cylinders.

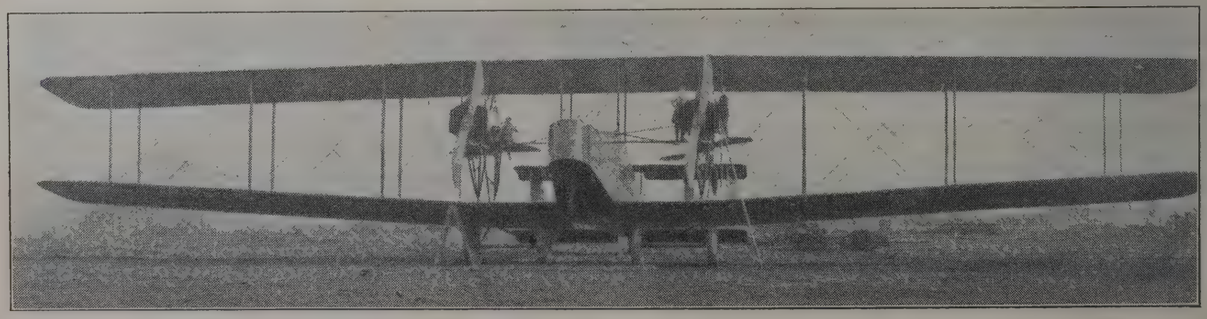
How would you find the direction of the wind?—By holding out my handkerchief.

You lose your way over the enemy lines. How would you find your way back?—I would come down and wait for someone to approach. I would then talk to him in English, and if he answered in German, I would turn round and fly back in the opposite direction.

What is the right bank of a river?—That bank on your right when you are speaking from the mouth of the river.

What are iso-bars?—Hot air rises from the ground, and where it meets cold air coming down from the sky, it freezes and forms iso-bars.

What are the chief duties of an Equipment Officer?—He acts as adviser to his C.O., looks after stores, etc., and sees that all rubber articles are wrapped in French chalk.



THE REPAIR OF MAGNETO PARTS.

It is not generally known that the vulcanite parts of magnetos (slip rings, distributors, etc.) can be effectively repaired if broken, and that the results secured are so satisfactory that repairs of this nature for aeroplane and other important work were carried out during the war with the full approval of the Government inspectors.

Messrs. Harvey Frost and Co., Ltd., who are responsible for this innovation, expect a large demand as soon as it is realised by motorists and the motor trade that valuable magneto parts, sometimes irreplaceable, need no longer be scrapped when broken, but that they can be repaired efficiently at trifling cost. They have opened, therefore, a special department to deal with this business, and they now invite anyone who may have broken vulcanite magneto parts on their hands to send them to 148-150, Great Portland Street, W.1.

A BELGIAN DECORATION.

The King of the Belgians has conferred the title of Commandeur de l'Ordre de Leopold II upon Sir Herbert Austin, managing director of the Austin Motor Co., Ltd., in recognition of "constant and generous help given to this country in the course of the war."

Front View of the Type V/1500 four-engined Handley Page Biplane described on page 616.

PATENTS INDEX

The subjoined list of recent inventions has been specially compiled by THE AEROPLANE from the current Official Patents Records :—

PATENTS APPLICATIONS.

Cummuskey, G. Device for locking steering gear and switching-off electric current from magnetos of motor-cars, boats, aeroplanes, etc. No. 14731. June 11th.
Dupigny, L. E. Toy aeroplane. No. 14646. June 10th.
Gosport Aircraft Co. Aerial machines. No. 14897. June 12th.
Houlden, H. W. Motive-power vehicles, ships and aircraft. No. 14727. June 11th.
Lyons, L. A. Aeroplanes. No. 14881. June 12th.
Macdonald K. Turbine for aeroplane and airship propulsion. No. 14628. June 10th.
Morris, F. Devices for automatically controlling aircraft. No. 14752. June 11th.
Palethorpe, J. Tail-skids for aeroplanes, etc. No. 14933. June 13th.
Potral, A. Flying-machines. No. 14815. June 12th.
Power, R. F. Aerial observation. No. 14767. June 11th.
Siddeley Deasy Motor Car Co. Balanced rudders, flaps, etc., of aircraft. No. 15029. June 14th.
Siddeley Deasy Motor Car Co. Fittings for metal framework of aeroplanes, etc. No. 15030. June 14th.
Siddeley Deasy Motor Car Co. Control mechanism of balancing flaps, etc., of aircraft. No. 15031. June 14th.
Supermarine Aviation Works. Flying-boats, etc. No. 14681. June 10th.
Tebaldi, A. Aeroplanes. No. 14687. June 10th.
Worsley, L. S. Undercarriage and landing device for aircraft. No. 14826. June 12th.

COMPLETE SPECIFICATIONS ACCEPTED, PRINTS OF WHICH CAN BE OBTAINED ON AND AFTER JULY 3RD, 1919.

127620. May 1st, 1917. Lanchester, F. W. Mechanism for receiving and launching aeroplanes at sea
127627. May 2nd, 1917. Lang Propeller, Ltd., and Mills, G. Construction of aerial propellers.
127628. May 3rd, 1917. Wolseley Motors, Ltd., and Remington, A. A. Internal-combustion engines (particularly aircraft engines) which are required to work under considerable variations of air pressure.
127633. May 5th, 1917. Aeronautical Instrument Co. and Brewer, G. Ripping panels for balloons and other aerostats.
127637. May 7th, 1917. Aeronautical Instrument Co. and Brewer, G Ripping panels for balloons and other aerostats.
127643. Jan. 27th, 1917. Birkigt, M. Combined gun and engine for aerial machines.
127644. Feb. 12th, 1917. Birkigt, M. Means for coupling internal-combustion engines.
127648. May 10th, 1917. Dawson, Sir A. T., and Buckham, Sir G. T. Aircraft gun mountings.
127658. May 15th, 1917. Roe, A. V. Device for anchoring bracing cable and the like.
127665. May 17th, 1917. Tarrant, W. G. Construction of girders, beams, struts, and the like for aircraft and other purposes.
127667. July 22nd, 1916. Soc. dite "Spad." Control of aerial machines.
127671. June 26th, 1916. Bleriot, L. Joints particularly for aerial machines.
127673. May 22nd, 1917. Sopwith Aviation Co. and Cato, H. E. Tool for extracting the fixing bolts of the propellers of aeroplanes and other aircraft.
127676. May 23rd, 1917. Armstrong Whitworth and Co., Sir W. G., and Allan, A. Hydraulic transmission apparatus.
127684. March 2nd, 1918. Woyevodsky, N. Aircraft.
127691. May 1st, 1918. Bowden Wire, Ltd., and Sentinella, A. E. Bowden Wire Mechanism.
127695. May 4th, 1918. Patent Corporation and Thompson, W. P. Flying-machines.

PATENTS APPLICATIONS.

127703. May 31st, 1918. Robins, T. H., and Thompson, G. H. Device for indicating the angular position of an aeroplane or like machine with respect to the horizontal.
127710. May 31st, 1918. Mooney, D. J. Method of or apparatus for building aeroplane wings.
127711. May 31st, 1918. Mooney, D. J., Brown, E. E., and Westcombe, A. C. Aeroplane wings having metal frames.
127743. June 18th, 1918. Rudge-Whitworth, Ltd., Pugh, J. V., Holroyd, V. A., and Nelson, W. H. Fairings or streamlinings for aircraft.
127748. June 20th, 1918. Hobbs, E. Sighting apparatus for dropping bombs from aircraft.
Aguirre, A. Means for automatically controlling steering mechanism of marine or airships. No. 15279. June 18th.
Austin, G. B. H. Aeroplanes. No. 15319. June 18th.
Blakoe, R. Friction driving gear for motor vehicles, boats and aircraft. No. 15517. June 20th.
Brown, E. E. Metal framework for aircraft. No. 15553. June 21st.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

CO-OPERATIVE PROPAGANDA. (COMPETITION FLYING.)

By "MEDWAY."

When dealing in my last article with the conduct of propaganda by individual firms, I hinted at my own opinion that the bulk of the work towards the development of commercial aeronautics throughout the world must be the result of co-operative rather than individual action.

The most obvious form of co-operative propaganda is to be found in races, trials, and other competitions. All these are certainly worth doing, provided that they are done well. We must have no nonsensical official interference calculated to give the world the impression that the machines turned out in this country are slow and feeble.

Up to a point races will serve our turn, because there are many forms of commercial aeronautics in connection with which speed is the first and most valuable factor. This applies to mail services, express passenger services, and attempts to create a rapid system of communications where cables do not exist or are inefficient or inadequate. Speed is not, however, the beginning and end of all things.

Endurance Tests.

I am convinced that the future depends in an even greater measure upon reliability, economy, and weight-carrying capacity. To prove these qualities we want trials more on the lines of endurance tests. To take an analogy from the Motor Industry, the private car benefited very much from the racing in the Isle of Man and on the Brooklands track. The best thing that was ever done for the commercial motor vehicle was the Royal Automobile Club's five-week trial, held in 1907. On each day of the trial the vehicles covered only a moderate distance at a moderate speed. Each day they moved from one centre to another, with the exception of an occasional day's rest at some large centre, where a sort of extemporary exhibition was held. The consumption of fuel, oil, and so on was very carefully noted and checked by observers. At the end of the trial all the machines were thoroughly inspected and examined for wear and depreciation.

I am convinced that it would be well worth the while of the British Aircraft Industry to work up an event on similar lines, covering anything from three to six hundred miles a day, and holding little exhibitions at a number of important points. The trials would result in some very useful figures bearing upon operating costs, and would give a good idea of the degree of reliability at present secured.

Experimental Services.

Last week I suggested that individual propaganda should take the form of the establishment of experimental services in various parts of the world. It would be better still if the Industry as a whole could co-operate for the establishment of, say, forty or fifty such services. Machines of a variety of British makes would be used. The central organisation would supervise the accounts of every service. Tremendously valuable data would be collected, as a consequence of which anyone contemplating the establishment of a service of any kind would be able to come to the central body representing the British Industry and to get some really reliable guide as to probable operating costs, based on experience and not on guesswork. The fee charged for such advice would be a heavy one, but the bulk or the whole of it would be returnable if the service were subsequently established and the orders for machines were placed solely with British firms.

The central organisation would also receive Press matter and photographs from all of its affiliated services and would distribute these, not so much for the glorification of individual firms, whose names would only figure incidentally, but for the purpose of rubbing into the world the supremacy of the British Industry as a whole.

In the first instance this last form of propaganda would be an expensive matter. Later on, as I have already suggested, a fair proportion of the services established would become profitable, and these would be floated as public companies or sold as going concerns. In this way I think that the bulk of the initial losses would be recovered. At any rate the risk would be far less and the possible loss far smaller if we took an average of a large number of services than it would be to the individual firm necessarily experimenting only in a few quarters.

It will be noticed that, in connection with this last scheme, I have referred only to the use of British aircraft. In such a scheme we should not want to advertise our competitors' goods, or to create goodwill for them by getting them known locally in various promising districts.

[One fears that a co-operative effort of this kind would not appeal to the individualistic Englishman.—Ed.]

The Policy of the Open Door.

On this whole question of whether we should limit propagandist competitions to British vehicles, whether we should exclude German machines, or whether we should open the door to the whole world, a very sharp division of opinion is possible. I do not altogether share what I regard as the super-cosmopolitan attitude of C. G. G. I admit that if you want to prove your ability to knock out Beckett in five rounds it is perfectly useless to advertise the fact that you have punched your small brother's head. Similarly, the fact that one British machine can beat another in a race or durability test does not prove that either of them can beat the foreigner, and this is really what we ultimately have to demonstrate. I think that in all speed tests the foreign machine, whatever its country of origin, should be allowed free rights of participation. Even if other countries do not follow our lead in this matter, the policy of the open door would be of advantage to us.

When it comes to any competition, part of the purpose of which is to secure reliable data of operating costs and so on, the case is different. One of our prime needs of the moment is to be able to show the prospective investor what it will cost to do certain work by air. We are very short of reliable data. So also are our foreign competitors. If we can provide such data in respect of our own machines, we are one up. Supposing that the foreigner has an even better proposition to offer, but

cannot put that proposition in convincing form because he has no accepted figures to show, it is not our business to provide him with them. I should therefore limit him to participation in races, stunts, and performances of a kind calculated to encourage the exceptional machine evolved for that purpose rather than the normal machine designed purely for commerce.

No Stupid Traditions.

Reverting to the question of experimental services, I recognise the difficulties in the way of co-operative action. I think, however, that these ought to be overcome by a young and progressive Industry with no stupid traditions in its way. In that case it would be far better for the Industry as a whole to organise these experimental services than for single firms to do so. Whatever may be the real ultimate intention, the manufacturer who starts to operate his products personally for profit lays himself open to the accusation of competing with his own customers on preferential terms, inasmuch as he can get his stuff at cost price. This encourages the customer to go elsewhere or to start manufacturing on his own account.

The existing manufacturer may reiterate the assurance that he was merely experimenting and had no intention of remaining permanently in the business, but it is very doubtful whether he would be believed. On the other hand, if the Industry as a whole worked out a scheme and publicly stated its intentions from the first, it is not likely that anyone would suspect it of ulterior motives. Moreover, the accumulated data, which would in this way be made available at one single centre, would be of immense value as bearing upon the prospectuses of independent operating concerns. Promoters of such concerns, if they really honestly believed in them themselves, would be quite willing to go to the central body to get a certificate to the effect that their estimates of operating costs were in accordance with the figures in the possession of that body. This would give much increased public confidence, and therefore would encourage the investment of money in aerial enterprises.

THE COPENHAGEN AERO-SHOW.

By ERIK HILDESHEIM (Copenhagen).

Under Peace conditions the second Scandinavian aero exhibition chiefly stimulated interest for coming events, the shows of the Danish Army and Navy being most attractive, the stand of the former including a Vickers 100 h.p. Gnome monosoupape pusher, an H. tractor of own model with 140 h.p. Argus, a Maurice Farman longhorn school biplane, and a 30 h.p. B. and S. monoplane, beside home-made 70 h.p. Renault motors.

The Navy exhibited their first aeroplane, a 50 h.p. Farman box-kite, a school flying boat with 100 h.p. home-made Curtiss motor, a 160 h.p. twin-float seaplane, and a 200 h.p. flying boat of the Danish type. The Swedish Army Works showed a biplane of German outlines with a 260 h.p. Mercédès, the stand of Thulin containing a single-seater and a two-seater scout and a 160 h.p. tractor.

Owing to the many service accidents the advisory committee, appointed by the Parliament, forbade the army all flying with the worn-out monosoupapes of the Vickers, as well as the Argus motors, with their vibrating camshafts, of the H tractors, and the Thulin engines of the scouts. Thus only the 1912 M. Farman model remained, on which Sergeant Bjarkow covered the longest distance in to and fro flying by Copenhagen, in the 12 hours allowed in the "Star Flying" called so for its demonstrating character of ending, from all corners of the Scandinavian countries, in Copenhagen, to arouse interest in the show.

The Danish naval pilots were not followed by luck, Lieut. Gylling on a flying boat being prevented by rain and mist from carrying out his full course between the extreme points of Denmark, and Lieut. Thiele having the screw of his tractor seaplane damaged by the rough sea at an intermediate landing which blew then off in the continued flight and smashed one float.

The Swedish competitors were prevented from completing by meteorological conditions, and thus the Norwegian partakers showed off best, being even to the credit of the British aircraft trade, as the two naval pilots, Lieuts. Lützow-Holm and Riiser-Lassen flew 130 h.p. Clerget Sopwith Baby seaplanes from the naval air station at Horten by Christiania to Copenhagen with one landing at Gothenburg.

Lieut. Ibsen of the army, a grandson of the two well-known Norwegian authors, Henrik Ibsen and Björnstjerne Björnson, on the first army-built tractor biplane with a R.A.F. motor put up a fine performance from the army Christiania aerodrome at Lillestrom, in spite of bad weather conditions.

As these three Norwegian pilots gave an exhibition of fancy flying over the Danish capital, this performance impressed too well of the training that the two naval officers had undergone at an English war flying school.

A passenger service was to have been run during the exhibition between Copenhagen and the Swedish city Malmö, but the Nielsen and Winther seaplane was smashed after forced landing in first two flights, and the Thulin seaplane was stopped by the Swedish police, till it had passed a technical examination, and carried then on the last days out a number of flights.

The first foreign pilot to come attracted by the show, was the German Sablatnig, who landed with two passengers at Copenhagen, after long efforts to be allowed to continue his service from Berlin to the last German station, Warnemünde on to Copenhagen. He flew his own type, the model N for night flying, with 230-h.p. Benz motor, and the front cockpit enclosed with Cellon plates to form a narrow cabin for three passengers.

Two more Sablatnig biplanes came later, one piloted by Capt.-Lieut. Berchtold, and were sold to a new Danish company named Airexpress, formed chiefly for joyriding, and said to have ordered eight more Sablatnig aircraft, two of which are to have sleeping accommodation in lying position for two passengers.

Next came a number of L.V.G. biplanes to a dairy-exporter to Germany, one of which, after an exhibition tour, was sold to a provincial haulage contractor, while the other ones have been demonstrated to the army, their sale or use for a flying school being negotiated.

A young war-profiteerer imported sundry Rumpler and other type slough relics from the German Adlershof aircraft churchyard and after superficial reviving sold a number of them, but the first customer, a young sportsman met, a few days after taking his ticket, with a fatal accident, both he and his passenger, being burned to death on an overland flight. The papers therefore ask for restrictions on the imports, but as the flying regulations have not been issued so far, the air bill monopolising all air traffic to the Government, which will give concession to influential companies in return for their big financial outlays, has not been passed yet, the police do not see fit to forbid hurried efforts, in most cases associated with German enterprise, otherwise than declining to grant passports for foreign aviators, and limiting the duration of those pilots, staying in the country already.

A Sleswig aviator piloted the other day a British Red Cross officer from Berlin to Copenhagen on an Albatros, and afterwards carried out an altitude flight to 20,000 ft. with two passengers.

The former C.O. of the Richthofen fighting squadron, Lieut. Göring, flew over a Fokker D VII scout with B.M.W. motor, and gave a demonstration to the military authorities, afterwards going out on exhibitions, but when a big meeting was to have been organised, which was patronised by the King and a number of members of the Royal Family by their presence, his motor gave troubles, and as the army pilots were forbidden to partake, and other expected partakers turned up neither, the show was very poor.

The best performance was by the Danish pilot Reichert, who has returned from Johannisthal with 3 Albatros biplanes, of which he put during the war 1,100 through their delivery tests, experiencing later a narrow escape with his two passengers, when one of his biplanes caught fire and was burned.

To have appeared was the Austrian pilot Sparmann, of pre-war fame as a Lohner pilot, and now chief design pilot to the Phönix Works, the largest Austrian aircraft manufacturing company and successors to the Albatros firm of Austria, who, flying a scout, turned up later in the company of Capt. Perelli, who flew a two-seater in 8 hours from Vienna to Copenhagen with two stops at the Szeco frontier and in Berlin. After demonstrating their aircraft to the advisory committee and others they continued their flight to Stockholm and later to Christiania. It is said that Sparmann has been engaged as designer and school instructor by the Thulin works that are to turn out Phönix aeroplanes.

Dutch pilots turned up too as guests at the Copenhagen show. First arrived a two-seater Friedrichshafen seaplane with naval officers, and next an Argus-engined Rumpler with officer pilots. Another aeroplane of same make and starting at the same time, met with a fatal accident to the two officers manning it, in Sleswig.

193, Regent Street,
LONDON, W.1.

J. H. MOORE,
Late Lt. R.A.F.,
9, MOUNT RD., HENDON, N.W.4

Testing of any Type of Aircraft undertaken.
5 years' experience—3½ years as Official Test Pilot.
Open to demonstrate machines abroad.

A BREACH OF AGREEMENT.

In an official document entitled "Directions Issued by the Secretary of State for Air, under para. 3 of the Air Navigation Regulations, 1919, dated April 30th, 1919," which bears what purports to be a reproduction of the signature of the Right Hon. Winston Spencer Churchill, there is laid down a scale of the charges which will be made to the owners of civil aircraft for accommodation and for landing fees at R.A.F. aerodromes.

These charges are based upon the floor space occupied by the machine. This is assessed on the product of overall span and overall length, and machines are classified therein as:—

Small type, less than 900 sq. ft.
Medium type, not exceeding 1,800 sq. ft.
Large type, over 1,800 sq. ft.

It appears, however, that the Civil Aviation officials at official aerodromes have received entirely different instructions, and that machines are to be classed as single-seaters, two-seaters, and large aeroplanes.

Thus, anyone flying a four-seater machine which comes within the published definition of a small machine must be prepared to be charged at the rate laid down for the large type if he is so ill advised as to land at a Government aerodrome.

It is not quite clear whether this performance on the part of the authorities is to be classed as foolishness or roguery.

It is a clear case of breach of agreement, and it would be interesting to learn what would be the views of the Air Ministry as to the action of the proprietor of a licensed private aerodrome who attempted to interpret his agreement as to charges for R.A.F. aeroplanes which landed upon his ground in a similar manner.

KILLING CIVIL AVIATION.

Though one knows, personally, that the operations of the Department of Civil Aviation are just pure natural foolishness, and are not inspired by any malicious intent, one cannot blame those who are less in touch with affairs for believing that it is the policy of the Department of Civil Aviation to kill all small firms who have the impudence to try and make a living out of aviation so that all civilian flying may pass into the hands of a few would-be monopolists who happen to be friends of the people in the Department. It has already been recorded, both editorially and in the advertisement columns of this paper, that the London and Provincial Aviation Co., Ltd., whose principal, Mr. Warren, is one of the pioneers of aviation in this country, have gone out of business, at any rate, until such time as Civil Aviation is controlled by people who know something about civility and aviation.

Considering all the good work that the firm has done during the war, it is a great pity that it should expire, or even suffer, from suspended animation, for nobody is better qualified than are Messrs. Warren and Smiles to turn out useful commercial aeroplanes at a reasonable price. One learns that they had actually in hand the designs for a five-seater touring machine with a 120 h.p. engine, which they intended to exhibit at the next Aero Show. This, however, will, of course, not be produced in view of the activities of the Civil Aviation Department.

Another small and enterprising firm which looks like being squeezed out of existence by the Department is the Cheltenham Aviation Co., Ltd., founded by Mr. Horace Wright and two other ex-R.A.F. officers who pooled their gratuities in the hopes of making a living out of the experience they gained in running aeroplanes during the war. It seems, however, that the mere war experience of practical aviators and engineers does not qualify them in the eyes of the stay-at-home officials of the Civil Aviation Department. The mere fact that these ex-R.A.F. officers were staking not only all they possessed in the way of cash but also were prepared to risk their lives in flying the machines in order to earn a living, does not seem to have weighed with the gentlemen of that institution which is becoming known as the "Fee-Snatching" Department.

Practically every other concern which has attempted to deal with the Department of Civil Aviation has nothing but complaints to make, and as this paper has already stated, it is quite time that the whole Department was overhauled from top to bottom.

THE AEROPLANE SITUATION IN THE U.S.A.

By G. W. Ketile.

From personal observation during a few weeks' visit to the United States, I am convinced that the Americans are thoroughly dissatisfied with their own progress in aeronautics. Whether in New York, Chicago, Philadelphia, Cleveland or Washington, I heard the same tale of woe.

The fact is their manufacturers came down very badly indeed over their war promises and supplies. The evidence is overwhelming; and though the average citizen says little he is very conscious of failure.

Here, the American believes in us. Doubting himself, he is convinced that the Britisher knows all about it. Being willing to trust us with his personal safety, he expects more inspiration and better supplies from England than from his own country. Our old reputation for thoroughness and conscientious workmanship, for initiative and skill, is doing us good service to-day.

There can be no question, again, that America wants aeroplanes—for commercial purposes and for pleasure. Remembering that in Cleveland, for example, one family in every five owns a motor-car, we may safely assume that the same spirit of restless enterprise—ever seeking after some new thing—will rapidly create the demand. For that continent, with her vast distances, is comparatively speaking, badly supplied with means of transit.

Her average roads do not reach at all a high standard of efficiency; there is very little railway development outside the great traffic systems. Yet her desires and her needs for the intercourse which prompts travel are rather exceptionally urgent.

Speed, too, is very imperative, and must be maintained over a number of miles scarcely contemplated in our little island. And gasolene is cheap. Wherefore, more and more, day by day, America is looking to the air.

Information as to the possibility of aeronautics is badly needed to-day in the States. Who is to build and establish her factories? Who is to supervise the work?

Since we English are leading in this matter, what have we really learnt from our five years' experience at war? Are we already applying that experience to peace purposes?

It is true that the whole question of air navigation laws, etc., though pressing, may not be decided for some months? But our cousins over the water are not likely to wait for the final result of deliberations affecting the interests of the whole world. They want practical programmes here and now—and they will find them, somewhere!

Three-quarter Front View of the "Westland Limousine" described on pages 597-598.

CIVIL AERIAL TRANSPORT NOTES.

GREAT BRITAIN.

Attention is drawn by the Air Ministry to the Secretary of State's order published in the "London Gazette" of Aug. 1st, which makes a small alteration in the method of marking aircraft.

Under the Regulations published on April 30th the marks of civil aircraft were to be underlined with a black line; the International Air Convention reserves this black line for one particular type of aircraft, i.e., the private or tourist aircraft as opposed to the commercial or State machines. The order published in the "London Gazette" of Aug. 8th thus brings the British Regulations into line with the International Convention in this respect.

The Big Purchase of Avros.

Mr. S. W. Copley, the managing director of Copley's Bank, 1, Queen Victoria Street, who purchased the 280 new Avro machines from the Aircraft Disposal Department, has also bought several other machines.

At present the project is in the air, but an aerodrome has been obtained near London. The machines, or some of them, will be used for passenger and cargo-carrying at a fixed and moderate mileage scale of payment.

An Aerial Police Force.

Major-Gen. the Right Hon. J. E. B. Seely, C.B., C.M.G., D.S.O., M.P., the Under Secretary of State for Air, has stated that it is not considered that the expense of maintaining an Air Police Force would be justified at present.

Free Flights.

The "Daily News" announce that they will give on Saturday, Aug. 16th, and on Monday, Aug. 18th, a total of 226 free flights. In addition to these, 20 free flights are announced for Nottingham on Aug. 13th.

Flights at the following places are to be given on Aug. 16th: Cricklewood, 100; Hastings and Southend, 20 each; Swansea, 16; Great Yarmouth and Eastbourne, 15 each; Sandown plus Ventnor and Torquay plus Paignton, 10 each.

On Aug. 18th seaplane flights will be given at Brighton from the end of the West Pier.

A Tax Collector Missing.

An Avro pilot recently conveyed passengers to a recognised Government aerodrome in Lancashire. He landed, and as no one came out to assist him or paid any attention to him he departed again without paying his 5s. landing fee.

Major McMinnies was under the impression that the charge of 5s. is made in return for services of taxying in with mechanics' assistance, etc., but when there is no one about and the machine only alights for a few moments this toll seems rather excessive.

Blackpool.

The five-seater Avros signified their arrival at Blackpool by setting up new records for the week ending Aug. 9th, nearly 500 passengers being flown in one day by three pilots. Thousands throng the beach all day long waiting for the day when flights will be 5s. each.

Brighton.

Eighty-five flights were made by Avro machines for the week ending Aug. 9th, and 212 passengers were taken up.

Cambridge.

The Cambridge School of Flying had a record day on Bank Holiday, Aug. 4th. Numbers of people turned up at the Hardwick Aerodrome to watch the flying, and many were taken up.

Lieut. Ortweiler piloted the only flyable Avro the whole day, and did many stunts, which the passengers enjoyed. In the afternoon, another pilot made a very short trip on one of the Caudron machines.

Conway.

It is hoped that when the Air Ministry's licence for the Morfa Ground, Conway, is granted, a special service will be inaugurated between Rhyl and Conway. The Morfa is an excellent centre for North Wales, Llandudno, Conway, and Colwyn Bay being within a few miles of the landing-ground.

Cowes.

Colonel Wingfield, a well-known member of the Royal Yacht Squadron, with three friends, flew from Cowes to Portsmouth on August 5th, in a Supermarine flying boat to witness the departure of the Prince of Wales to Canada.

A Supermarine flying boat attended the Cowes Regatta each day. Members of the R.Y.S. and other clubs were taken up and followed the yacht racing from the air.

Great Yarmouth.

Free flights were given by the "Daily Sketch," the "Illustrated Sunday Herald," and the "Evening Standard" at Burgh Castle on Aug. 3rd. Further flights were arranged to be given on Aug. 7th and 10th.

Hull.

Proposals for a new aerodrome at Hull have been discussed on the spot by a committee of the Hull Corporation and Lieut.-Col. Beatty of the Air Ministry. Lieut.-Col. Beatty stated the Scandinavian and Dutch traffic would probably come to Hull.

Isle of Man.

Capt. Pixton did very well for the week ending Aug. 9th in delivering his 3,000 copies of the "Daily News" daily to Douglas. The weather was not always kind, as on occasions he had to battle with 40 m.p.h. winds, but he got through to time despite them and a certain amount of mist. A standard Avro seaplane is used, but with a special compartment for papers instead of passengers.

Avros are reported to be as busy as ever at Douglas, "Round the Island" flights being the latest idea. Lieut. Moxon has an ideal spot for pegging his machines down as they are situated outside the Castle Mona Hotel, just off the promenade, where other but less up-to-date means of transport, such as cars and cabs, are also parked!

London.

Hendon.—Capt. Gathergood, with two passengers, in an Airco D.H.4.a machine, flew from Edinburgh to London on Aug. 5th. The flying time was 3¼ hours, and an average speed of 120 m.p.h. was made. The fastest express trains take over nine hours to do this journey.

Hounslow.—During the week ending Aug. 9th, 347 passengers were carried in Avro machines.

A five-seater Avro machine with Mr. H. R. Hastings (late R.A.F.) as pilot, and carrying two passengers and a mechanic, set out from Hounslow at about 5.30 p.m. on August 6th to fly to Camberley. The pilot was preparing to land near the Royal Military College when the machine dropped thirty feet onto the ground and crashed.

Mr. H. R. Hastings was killed. Major Phillips was seriously injured, and taken to the Royal Cambridge Hospital. The other passenger and the mechanic were uninjured.

Mr. Hastings was a highly skilled pilot who had done a great deal of flying. He was for some time instructing in flying in the R.A.F. at the Shoreham aerodrome. A short while ago he took Major Phillips on a flying trip from Hounslow to Swanage.

It is claimed that A. V. Roe and Co. have carried over 20,000 passengers in short and long distance flights, and that this was the first accident experienced in connection with passenger flights.

Margate.

Nearly 300 passengers were taken up in Avros at the Manston aerodrome during the week ending Aug. 9th. Among the passengers was the well-known jockey Duller. Miss Carrie Tubb flew to Herne Bay for a special engagement. A number of people arranged to fly to the Folkestone Races this week

Nottingham.

On Friday, Aug. 8th, Major McMinnies flew from Southport to Nottingham to see Sir Jesse Boot. Landing in a small field next to the Boots recreation ground, he transacted his business and was back at Southport again in thee same time that it would have taken to reach Nottingham by train. It is probable that a Boots flying week and aerial gymkhana and fête will take place at Nottingham during September.

Preston.

Preston Aerodrome will be opened very shortly for Avro flying, as the Air Ministry has granted a licence for it.

Rhyl.

Three Avro pilots have been kept busy during the week ending Aug. 9th, the Rhyl Council leading the way in flying, and rendering every possible assistance to the scheme.

St. Andrews, Fife.

The first day, Aug. 6th, of the four days' passenger flights in two Avro machines was a great success. The first passengers to be taken up from the sands were the Provost and the Town Clerk. The pilots were Capt. Simpson and Lieut. Doren.

Southport.

A dual-control machine for women pupils is expected shortly. The machine is a standard 100 h.p. mono Avro, and pupils will be taught by means of a telephone.

Last Saturday, Aug. 9th, flying continued till 10 p.m., and even when the pilots stopped in the moonlight there were a few more couples waiting to book.

Southsea.

Aeroplane flights over Southsea Common have not been very satisfactory financially. The Portsmouth Corporation Parks Committee have been advised to stop the flights as soon as possible.

Swansea.

During the holiday week crowds flocked to the Avro Aerodrome from extensive factory and mining districts of South Wales to get their first experience of flying. A large force of police was necessary to keep the waiting crowds off the aerodrome.

Aeroplanes were in great demand to carry passengers to the beautiful Gower coast for fishing or bathing. The local Commandant of the Boy Scouts flew for a parade to the sands of Port Eynon.

On Friday, Aug. 8th, in response to a letter from Llanwrtydd Wells, Capt. Dalton flew from Swansea to the grounds of the Abernant Lake Hotel. As a result of his visit passenger flights will be given daily at Llanwrtydd Wells. Many flights from the Wells have already been booked by visitors at other neighbouring towns.

A daily service was arranged to start on Monday, Aug. 11th, for the Wells, leaving Swansea at 11 a.m., and returning at 7 p.m. This route passes over the fine scenery of the Black Mountains.

643 passengers have been carried since July 26th without any mishap.

WESTON-SUPER-MARE.

At this town 232 passengers have been taken up in an Avro five-seater and an Avro three-seater during the week ending Aug. 9th.

Free flights have been given by arrangement with the "Bristol Times and Echo" and the "Daily News."

There are now two aviation companies established at Weston-super-Mare. On Aug. 1st a company had secured an aerodrome in the vicinity of Brean Down, across the River Axe. This company will cater for Burnham and Bridgwater, as well as Weston.

The sands aerodrome has proved very popular, crowds flock to that end of the sea-front which was only sparsely populated before. Tents are pitched near the enclosure, and family parties camp out in approved Bohemian fashion.

WEYMOUTH.

A seaplane piloted by Captain Alan Storey, late R.A.F., with a woman passenger, fell into the sea near Weymouth owing to the breaking of the airscrew. The machine was proceeding to Bournemouth. Both pilot and passenger were rescued.

CANADA.

Capt. Ernest Hoy, D.F.C., flew a Curtiss machine from Vancouver to Calgary *via* Crow's Nest Pass on Aug. 8th in 16 hrs. 48 mins. The distance is 745 miles. This is the first flight across the Rockies.

BELGIAN CONGO

The Belgian Congo aerial service is to be started on Jan. 1st, 1920. The route will be over the whole Upper Congo River, from Kinshasa (terminus of the railway from Matadi) to the Katanga. Seaplanes of a French type (Levy-le-Pen) will be used.

They will carry express mail and express parcels, and will fly in connection with the arrival and sailing of the mail liners of the Antwerp Compagnie Belge Maritime du Congo.

A special series of postage stamps is to be issued for the letters, etc. It is not yet decided whether passengers will be carried. Photographs will also be taken to be used for the drawing up of the hydrographical map of the Congo river and of its tributaries.

A Commission, formed by Col. van Crombrughe, Major Paulis and Commandant Jaumotte, is investigating matters connected with the scheme in Belgium. A party, headed by Engineer Allard, is to leave by the next Antwerp boat to choose the spots on which the sheds will be erected. The first aeroplane flights in Central Africa were given in 1913 at Elizabethville by the Belgian pilot Lescarts.

DENMARK.

The Danish Ministry of War has leased the military aviation ground near Copenhagen to two pilots. They propose starting a flying school there with German machines. The full course will not cost more than 3,000 kronen.

FRANCE.

The following flights will be attempted shortly by pilots who are in training at Villacoublay: Paris-Constantinople, Major Vuillemin and Capt. Leune; Paris-Cairo, Lieut. Dagneux; Paris-Fez, Lieut. Bonzac and Lieut. Patamhon; Paris-Rome, Lieut. de Romanet.

The Arc de Triomphe was flown through by a French aviator at 7.30 a.m. on Aug. 7th. His name is Charles Godefroy, and he had only been demobilised two days before. On an ordinary Nieuport, with an 120 h.p. Le Rhône engine, he descended in a spiral over the Place de l'Etoile and got in a direct line with the entrance of the Arc. He passed through the Arc at 90 m.p.h. and continued on to the Concorde.

The actual height of the Arc de Triomphe is some 90 ft., and its width is only 43 ft. The span of the machine varies in the various accounts from 22 to 27 ft.

Navarre was going to perform this feat soon after he was killed.

An enterprising Paris firm took a cinematograph film of the flight through the arch. The Prefect of Police has forbidden its exhibition until further notice.

GERMANY.

A large German aeroplane, belonging to a German aerial company and hired by the Ukrainian Government, crashed in the Raudten Forest, in Upper Silesia, on Aug. 5th.

The pilot and all the passengers, including M. Vitovsky, a former Ukrainian Minister, were killed. The machine also carried a great deal of money and important documents.

The flight began at Breslau and was to have continued to Podolein.

A German Government wireless message reported that it was shot down by Polish frontier troops.

The machine is reported to have had a span of 43 metres, five motors of 260 h.p. each, and a load capacity of 4,500 kilogrammes.

The Deutsche Luft Reederei has been founded by the A. E. G. Company, syndicated with the Zeppelin works. It has the assistance of the Hamburg-America Line in all matters relating to traffic, and has been established for commercial aviation to the exclusion of stunt flying. In the first three months of its existence 916 flights have been made without an accident. The total distance of those flights would encircle the world nine times. The average journey Berlin to Weimar has been made in just over two hours. In one day 1,300 lbs. of mail were taken from the Leipzig Fair. The "D. L. R." possesses 70 small and 20 large aeroplanes.

Since the opening of the seaside resort service the "D. L. R." has transported 44 persons and 8 tons of mail.

Three large aeroplanes left Berlin on July 19th for Swinemunde, each carrying eight passengers for the week-end trip.

On the same date a Berlin family hired a large private machine and flew to Rugen.

During the races at Harburg the "D. L. R." ran an air service from July 17-30th to connect with the postal service Berlin-Braunschweig-Hannover-Gelsenkirchen-Rhineland. The Harburg line connected at Braunschweig.

The Berlin Luftschiffbau G. m. b. H. have announced, regarding the New York to Hamburg aerial line, that no result has been achieved, although negotiations have been started. The company anticipates a regular trans-Atlantic Air Service for the summer of next year.

"Weser Zeitung," of July 24th, announces that the aerial line Berlin-Hannover-Gelsenkirchen which had been stopped for some time owing to the lack of raw material has again been started.

To connect the service by motor with Essen-Duisburg-Dortmund, etc., the various towns have promised to subsidise it. This will mean a tax of 2 pfennig per head on the local population. In Dortmund, for instance, the assistance given amounts to 6,000 marks.

It is rumoured that a new type of airship has been constructed in Germany which will make its first flight on about Aug. 16th from Berlin to Friedrichshafen *via* München. It will carry mails and 20 passengers exclusive of crew.

It is said to have a speed of 120 m.p.h., and that it will cover the distance within seven hours. A regular service will be started over this route, which eventually will be extended to Switzerland.

GERMAN TRADE NEWS.

The Danish correspondent of THE AEROPLANE writes:—

The well-known German naval expert and contributor to the German paper, "Berliner Tageblatt," Captain Persius, has issued a pamphlet entitled "Tirpitz, the Gravedigger of the German Navy," in which he shows the poor results of the airships, claiming the unreliability of the Zeppelins and the Maybach motor as the chief reason.

Against these statements the Zeppelin Airship Building Co. and the Maybach Motor Works in Friedrichshafen put large advertisements in the German technical papers, quoting first his remarks that technical imperfection was the reason for stopping the employment of the airships, as their military achievements in the war were very small, as they were often exposed to the enemy weapons owing to lacking manœuvring capacities, many cases being due to engine breakdowns. It is, however, published as a fact that one single report of "L.11" saved the whole German fleet from destruticon.

In the parallel articles on modern national aircraft, run by the German journal "Flugsport," various news is gradually revealed. Thus it is reported that the Hannoverische Waggonfabrik started by building Rumpler and Aviatik two-seaters, and Halberstadt scouts under licence. The firm engaged the pioneer designer Dorner, whose monoplane with front motor and propeller drive aft crashed in the fatal accident to its chief exponent. They are producing now the various Hannoveraner products.

The Aviatik works took over the Grade plant at the Bork aerodrome and produced Staaken giant aircraft after the end of 1916. It appears that the front motor installation has soon been abolished, the Aviatik specimen having a power plant amounting to 1,500 h.p. in the two interplane engine nacelles made up with two front ones of 230 h.p. and two rear 12-cyl. ones of 500 h.p. each.

Horrible conditions are reported at the aircraft stores in Adlershof, where 6,000 workmen are paid £37,500 a week without doing anything, as 500 men would suffice. It is alleged that mostly everyone steals when leaving after 4 o'clock, foremost the safety guards, 400 of which were to have been dismissed last February, though it has not been done yet. The result of the Bolshevik workmen management since the revolution amounts to £1,100,000 loss against £8,750 income.

HOLLAND.

According to the "Times" of Aug. 7th:—

Sir John Alcock, K.B.E., D.S.C., is selling seats in his aeroplane for passenger flights at the Amsterdam Exhibition to the highest bidders. The money thus received will be given to the poor of Amsterdam.

ITALY.

A flight from Varese to Barcelona, a 560-mile coastal trip, was made a few days ago by Petty Officer Zanetti with Signor Buzlo, the technical manager of the firm, on a Macchi 3 seaplane with an I.F. 150 h.p. engine. The M.9, with passenger accommodation, as seen at Taliedo, will shortly be following her, as Messrs. Macchi are out to show their wares to the Neutrals with cash to spare and some fear of future wars.

Among the eye-openers was a Caproni trip from Milan to Turin and back with two pilots and 15 passengers, in 2 hours; stated to be a world's record. The weight of passengers is not stated.

To a Socialist M.P., who lamented the waste of money on aviation when half Italy has no roads and no railways the new Premier replied deploring the threat of a general strike then being held over the Government's head, and stating that all arrangements were ready for guaranteeing communications and the transport of passengers by air if the threat were carried out. In fact, a large wine firm in Turin is advertising that their next consignment of wine "will arrive from Rome by dirigible if other means of transport are not available."

It was also stated in Parliament recently that of the 100,000 men employed in aeronautical factories in November last, there now remain fewer than 27,000. The orders for material in connection with the Air Forces amounted to 8 milliards of lire at that date. Which explains why some folk regret the collapse of the Central Powers.

Col. Berliri-Zoppi is now at the head of Aeronautics here—Civilian side—whilst Gabriele D'Annunzio has accepted the post of High Councillor to the Department with, apparently, acting powers. Col. Berliri-Zoppi announces that the Government will hold a show of Italian aeroplanes and parts at Pekin to back up the Mission being sent there.

It appears that the great Italian Aero demonstration by the Levant Squadron at Constantinople was very effective. Several C.As., including a big triplane and a small fleet of S.V.As. delighted the Turk by giving cool, comfortable trips. Some of the big Allies were slightly jealous, on dit! Count Sforza is at the head of the Mission.—T. S. H.

NORWAY.

According to the "Morgenblad" of Aug. 5th, a British expedition will leave Tromso in the next few days for Spitsbergen. The preparations for the expedition are being made with great secrecy.

Independently of the expedition a British aviator will fly shortly from Tromso to Spitsbergen.

SOUTH AMERICA.

Lieut. Antonio Locatelli, the Italian pilot, has recrossed the Andes and reached Buenos Aires after a direct flight from Santiago de Chile.

SWEDEN.

The Copenhagen correspondent of the "Times" states that a seaplane approached the coast at Smygehuk, the southernmost point of Sweden, on Aug. 10th. It dropped two parcels, which were picked up by a German couple who lived in the neighbourhood.

Coastguards seeing the incident pursued the Germans without success, but they were arrested at a railway station, searched, and the parcels were found on them. The parcels contained jewellery and shares worth a great deal of money, which belonged to the ex-King of Saxony.

The attempt is said to have been arranged by the Prince von Wied (pre-war ruler of Albania), and according to one version he was himself on the seaplane.

Reuter states that the ex-King of Saxony's attorney denies the report that the Prince von Wied attempted to take the securities of the ex-King to Sweden by aeroplane.

It was noted in THE AEROPLANE on July 30th that Major C. H. R. Johnston and Captain K. Saunders, late R.A.F., had started passenger flying in Sweden. They are doing school, passenger and exhibition flying on two Avros and a D.H.6. The Swedish public are at present very ignorant as to the possibilities of aviation. Germany is making strong efforts to establish a strong foothold for their machines in the country. Owing to the wooded nature of the country and the absence of any really good fields, Sweden is only suitable for machines with very slow landing speeds.

At present there are only three aerodromes of any importance, namely, Hägerstalund, near Stockholm, where Major Johnston and Captain Saunders are, Malmslett, which is the headquarters of the Swedish Air Force, and a civilian aerodrome at Landskrona, belonging to the Thulin people. The climatic conditions are good for aviation. The visibility on an average day is 100 miles. Rain and fog rarely give trouble. The surrounding country is ideal for seaplane work, as at 3,000 feet one is never out of gliding distance of water.

The Danish correspondent of THE AEROPLANE writes:—

It is pleasing to record from here that so far the longest flight to the Danish capital has been carried out by a Dane, Lieut. Krause Jensen, on voluntary French service, who made on a Bréguet (300 h.p. Renault) a non-stop flight from Villacoublay to Copenhagen, though his first intention was to continue to Stockholm, whither he flew next. Continuing to Christiania he had engine breakdown, as he had forgotten to open the cock for lubrication. He then went back to Paris to fetch a new motor, and, on his return, found so many metal parts stolen that he was unable to continue.

The large extended Danish telegraph firm, Great Northern Cable Co., expressed fears of the competition with aeroplanes and wireless, when discussing future prospects at the general meeting this year.

U.S.A.

The Post Office Department inaugurated a continuous air mail service between New York and Chicago on July 1st. The route is divided into three stages, the intermediate stations being Bellefonte, Pa., and Cleveland, O.

The Cleveland-Chicago stage has been in operation since May 15th, but the organisation of the other two stages was delayed on account of the difficult ground that the route follows, particularly between Bellefonte and New York, where there are only few natural landing grounds. The total distance is about 750 miles.

Letters from New York to Chicago will reach their destination in from eight to nine hours with the new through-going air mail service. Mail will be delivered on the Pacific coast 24 hours earlier than it was.

Most of the machines used are rebuilt D.H.4a biplanes with Liberty engines. They have a capacity for 400 lbs of mail

The New York terminal of the air mail service has been transferred from Belmont Park to Newark, N.J. This arrangement was made to avoid the fog which hangs over Long Island early in the morning, and also in view of the better train connections with New York.

What is claimed by the "Aerial Age Weekly" of America to be the largest post-war order for aircraft has been placed with the Curtiss Aeroplane and Motor Corporation of Buffalo.

The order consists of 225 aeroplanes and 200 engines. Of the machines 150 are the Curtiss Oriole type land machines and 75 are Curtiss "Sea Gulls." The engines are all of one type—namely, the new Curtiss 150 h.p. model, whose fuel consumption is estimated at one-tenth cent. per mile.

On Aug. 9th Mr. C. W. Webster started on a tour of South America, his intention being to demonstrate American-built machines. He takes with him several well-known American pilots, and the machines include the Curtiss Oriole, Sea Gull, and Hornet. The latter is a two-seater fighter.

The United Aircraft Engineering Corporation of New York, through its London agents, the Canadian and General Trust, Ltd., is buying from the Minister of Munitions Aircraft Disposal Department, 700 aircraft engines and a large number of aeroplanes. These are for export to Canada and the United States.

A QUESTIONABLE CLAUSE.

Major C. G. Turner, in the "Observer" of Aug. 3rd, writes:

"Ballooning does not appear likely to revive to any extent this year. There are general complaints of official discouragement. The Regulations for pilot's certificates contain one very questionable clause: It is that each of the test trips shall be of a minimum of two hours' duration.

"That is all very well for most Continental countries, but in England, Denmark, Sweden, Norway, Japan, and other countries of small land area, it is difficult. In England, during the spells—weeks long sometimes—of westerly winds, balloonists starting from London often find themselves compelled to land after little more than an hour, for fear of drifting over the Thames Estuary or the North Sea. The records of 'free' ballooning during the war give over many long periods an average of 80 or 90 minutes per trip. On occasion balloons had to descend before completing the minimum of one hour.

"Why that minimum should now be made two hours is not clear. Quite a lot of balloon management can be learned in an hour, and there is only one landing—the most important matter—in any case."

THE LOWEST HEIGHT RECORD.

An evening news-sheet last week published an account of "a new height record" of 22,000 feet. This is believed to be the lowest height record made in recent times.

AIRCRAFT FINANCE

CURRENT TOPICS.

Very Little Activity.

These are the dog days in the Stock Exchange, but instead of the customary humdrum stagnation, there has been some activity of the nervous sort arising out of the Labour unsettlement. Everything has been off-colour, including Aircraft securities.

Aircraft Manufacturing Notes.

Some of the holders of Aircraft Manufacturing 7 per Cent short term Notes appear to be growing nervous. They are standing about 96. The nervousness is due to the uncertainty natural to the change over from war to peace conditions. However, it must not be overlooked that these Notes are redeemable by five equal annual drawings over a period commencing Oct. 1st, 1921, at a premium of 15 per cent., or earlier, at the company's option, at a similar premium, on six months' notice.

Handley Page Recovering.

There has been a further recovery in Handley Page Participating Preference shares to 17s. The issue price of these, it will be remembered, was 21s. The recent fall was overdone, and it would not be surprising if the recovery made further progress.

An Ambitious Project.

It appears that about 280 Avro machines, the balance of the Government stock, has been bought by one individual who intends to "inaugurate express services from a centre near London where the machines will be always ready to take passengers or merchandise to almost anywhere."

This sounds impressive in itself. In an interview the purchaser did not give anything away as to his intention beyond that he seems to believe that no one has yet tackled Commercial Aviation projects as they ought to be tackled. Appositely, the early days of motors were referred to, and, somehow, similar pitfalls are to be avoided in this new venture. One has heard things like this before. Anyhow, the greater the experience the more intense the knowledge, and that is all for the good of aviators commercially and financially.

Waring and Gillow and Aircraft.

Nothing further has developed in connection with Whiteheaus, but one is particularly interested in Waring and Gillow. Although actually a store business, Waring and Gillow interests have been largely connected with Aircraft construction. The accounts now published cover the operations of three years, and not a word is mentioned about Aircraft.

Presumably, the investments held in subsidiary companies, which have increased very considerably, owing to the exigencies of Government contracts, may have some bearing on the Aircraft ventures. These investments in subsidiaries appear as an asset for £822,319, which is the valuation of the directors.

The results failed to inspire enthusiasm. Trading profits for the three years aggregated £1,217,542. After meeting three year's dividend on the preference shares, and writing off £42,500 for discount and underwriting commission, there remains £942,048 to be carried forward, subject to an estimated liability of £880,000 for Excess Profit Duties and income tax. This is a big lump.

Simplified Excursion Insurance.

A week or two ago attention was drawn to the simplicity of insurance for aerial trippers. The simplicity is even more marked in the new scheme of the Aviation Insurance Association. Bookng agents and the transportation companies themselves are provided with books of insurance certificates requiring only the passenger's name.

One schedule covers the payment of £500 in the event of death for a premium of 2s. 6d. If the passenger wants to cover £5,000 in the new scheme of the Aviation Insurance Association. premium in all. Accidental injury, involving payment of £500 in the event of loss of two limbs or both eyes, or one eye and one limb, or permanent total disablement, can be covered for another 2s. 6d., which premium insures the payment of £250 in the event of the loss of one limb or one eye, and, alternatively, covers the payment of £2 10s. per week for 26 weeks in the event of temporary total disablement.

These premiums of 2s. 6d. for accidental injury are limited to six multiples of each or any of the benefits specified. That is to say, six half-crowns cover six times the payment.

The foregoing are aerodrome flights. There is another schedule covering similar risks when the passenger is flying within the land limits of the United Kingdom, which embraces trips by seaplanes not further than five miles from land. Here the premium is 5s. for similar benefits.

One cannot help admiring the excellent manner in which these insurance facilities are being enlarged for the benefit of the Aircraft Industry. When the general public realise how freely such facilities are offered, Aviation will become more popular

Brazil Aerial Contracts.

It is announced that the President of Brazil has formally sanctioned the contracts with Messrs. Davidson, Fuller, Joas Varsco, and Handley Page, Ltd., for the establishment of aerial services between Brazil and other countries. No further details transpire.

NEW COMPANIES.

Aircraft Tubes and Pressings, Ltd.—Private company. Registered May 24th. Capital £15,000 in £1 shares. To enter into agreement (1) of sale and purchase between Millward and Hughes, Ltd., of first part; and (2) of service between W. W. Hughes of the first part, G. V. Stringer of the second part, and the Company of the third part, and to carry on the business of manufacturers of and directors in tubes, etc. The subscribers (each with one share) are:—W. W. Hughes, 85, Middleton Hall Road, King's Norton, Birmingham, managing director; G. V. Stringer, 26a, Eaton Terrace, S.W., managing director. Directors: W. W. Hughes, G. V. Stringer, A. Millward, 80, Middleton Hall Road, King's Norton and W. E. Warden, 214, Hagley Road, Birmingham. Solicitors:- Jeffery Parr, Hasell and Parr, 20, Temple Row, Birmingham.

E. N. V. Motors, Ltd.—Private company. Registered May 30th. Capital £100,000 in £1 shares. To take over the business of a motor manufacturer and engineer carried on at 4, Hythe Road, Hammersmith, as the E. N. V. Motor Co., by Brig.-General J. F. Laycock, D.S.O., to acquire the benefit of an agreement between the said J. F. Laycock and B. Oppenheimer, etc. Power is taken also to manufacture and deal in aircraft of all kinds. The subscribers (each with one share) are: H. S. Dennington, 117, Whitehall Court, S.W., merchant; A. E. Hukins, 31, Hartswood Road, Stamford Brook, Middlesex, engineer. The first directors are: H. S. Dennington, A. E. Hukins, and G. M. Oppenheimer. Qualification, £2,500. Solicitor: A. Tooth, 37, Lincoln's Inn Fields, W.C.

Aeronautical Intelligence Bureau, Ltd. Registered June 13th, as a company limited by guarantee, with not more than 150 members, each liable for £1 in the event of winding up, to unite for mutual advancement and protection certain persons, companies and firms carrying on business as manufacturers of and dealers in and agents for aeroplanes, airships, balloons and parts thereof, to obtain and distribute status information, to promote or oppose legislation, to collect debts, etc. The subscribers are:—R. H. Tetley (Palmer Tyre, Ltd.), 121, Shaftesbury Avenue, W.C.; F. M. Luther (Beardmore Aero Eng., Ltd.), 112, Great Portland Street, W.; J. Riendt (British Emaillite Co., Ltd., aero dope and varnish manufacturers), 30, Regent Street, S.W.; G. A. Mansfield (Motor and Aircraft Supplies Co., Ltd.), 125, Long Acre, W.C.; R. Delpech (Triplex Safety Gear Co., Ltd.), 1, Albemarle Street, W.; J. F. Inshaw (Auster, Ltd.), 133, Long Acre, W.C. (2); W. A. Jewell, 56, Shelley Avenue, Manor Park, E. (12). The first members of the council are to be nominated by the subscribers. Registered office: 30, Bedford Row, W.C.

Davidson Motor and Carriage Co., Ltd.—Private company. Registered July 7th. Capital £20,000 in £1 shares. (17,500 ordinary and 2,500 "B"). To adopt an agreement with the Davidson Aviation Co., Ltd., for the acquisition of certain garage premises, stock, plant and machinery, and to carry on business as garage proprietors, etc. The subscribers are:—P. L. Mott, 6, Cornwall Terrace, Regents Park, N.W., timber merchant, 300 "B"; S. Hoare, 17, Cornwall Terrace, Regents Park, N.W., solicitor, 300 "B"; T. Bain, 9, Ravenscourt Avenue, Hammersmith, W.5, joinery manufacturer, 300 "B"; G. H. Cude, 17, Colebrooke Avenue, W. Ealing, accountant, 150 "B"; N. Rawlins, Mansion Hotel, Richmond, motor engineer, 150 "B." Directors: P. L. Mott, S. Hoare, and T. Bain. Registered office: 16 and 18, Avonmore Road, West Kensington.

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

Honours for the Chief of the Air Staff.

In the list of monetary rewards granted by the Houses of Parliament at the King's will on August 6th last, Sir Hugh Trenchard was awarded a grant of £10,000, the only representative of the Royal Air Force to receive such a gift.

On the same day it was announced that among other distinguished officers receiving honours the King had been pleased to confer a baronetcy on Sir Hugh Trenchard.

All will join in congratulating Air Vice-Marshal Sir Hugh Trenchard on these well-earned honours, and one hopes that he will live long to enjoy the fruits of his labours and to continue his great work at the Air Ministry.

The Schneider Cup Race.

The list of entries for the Schneider Cup Competition at Bournemouth on Sept. 10th is now closed. There are only seven entries. Three are allowed from each country. The Aero Club of France has entered three machines, and the Aero Club of Italy one machine. Three British machines will fly out of the following four: Avro, Fairey, Sopwith, and Supermarine.

Big Developments.

Probably a good many people are surprised that the name of Col. John Porte, C.M.G., R.A.F., does not appear in the Permanent Commissions list recently published.

As a matter of fact Col. Porte was demobilised from the R.A.F. some months ago and is devoting his attention to commercial aviation. It is not yet possible to make any definite statements concerning his movements, but one is under the impression that he has in hand a scheme for the development of flying-boats of the very largest size and for their operation on a grand scale. Certainly nobody knows more about flying-boats than does Col. Porte, and one hopes to be able ere long to chronicle the complete success of his scheme.

Wireless Telephony.

The wireless telephony demonstration given on August 11th by Major-General Seely in a committee room of the Houses of Parliament was a great success.

General Seely stated that the Royal Air Force started experiments early in 1915, and by March, 1918 two squadrons in France had been fitted with the apparatus. The postal aeroplanes such as those flying between Kenley and France are now so fitted.

Communication has been made with an aeroplane 100 miles away and with an airship 165 miles distant. No evidence has been obtained to suggest that the Germans had developed wireless telephony.

Two specially powerful valves were arranged to amplify the signals, which came through a trumpet and were audible all over the room.

A gramophone was heard from Aperfield Court, some 20 miles away.

Communication was then established with aeroplanes sent up from Biggin Hill aerodrome. General Seely was informed that his voice carried very well. He asked the pilot and observer of one machine to dine with him at the House of Commons that evening, and asked that the invitation might be communicated to other aeroplanes in the air within 20 miles. Six officers availed themselves of the invitation.

An observer in another machine was constrained to sing into the telephone.

Directional wireless was demonstrated. A novel wireless telephone was also shown in which the transmitter is pressed against the neck of the speaker. There is a wire connection down the trouser leg. The wearer can speak to anyone within range.

Opportunities in the R.A.F.

One continues to receive many letters from young men who are anxious to obtain employment in the Aircraft Industry. To all one would repeat the advice to join the R.A.F. The new rates of pay compare very favourably with wages in civil life when the value of free rations and free uniform is taken into consideration.

Any young man who is ready to go through the workshops of a commercial firm—and no other is worth his salt—would do better at the present time to join the R.A.F. in which he will find every opportunity of acquiring knowledge of aircraft that he can turn to account when the Industry has developed.

The New Rank Titles in the R.A.F.

There would appear to be considerable dissatisfaction among officers of the Royal Air Force as to the new rank titles laid down on Aug. 4th for the commissioned ranks of their service.

It is easy to criticise and many objections can be outlined in regard to many of the new titles. For instance, all "air officers" will be termed "marshals" colloquially just as all general officers are loosely termed "general" in conversation. This practice will reduce in public estimation the standing of field-marshals, the highest rank attainable in the British Army.

Another criticism can be directed against the use in this list of the names of gradings as rank titles. The term "squadron leader" implies certain duties which will certainly not be common to all holders of the rank. In both the Army and the Navy all rank titles are generic terms in an order of precedence, and no hint is given of the duties to be performed by any rank save in certain cases where special titles are given in technical branches of these services.

But while it is easy to criticise, it is difficult to construct. Let each of those who dislike the new names by which they are to be known think of any possible alternatives which shall be different from those common in the Army and Navy and yet be free from that suggestion of absurdity which enhalos the titles of dignities in rustic friendly societies.

The old rank titles of the dead empires such as "dux" or "centurion" can hardly be revived for use by people who habitually travel to their hotel headquarters by tube or omnibus. There are, in fact, no titles which be both apt and dignified and at the same time distinct from those formerly in use in the three services. The new titles are bad, but they must be accepted in the lack of a better series.

Exclusive Misinformation.

The "Daily Mail" of August 11th announced that "air taxis for the Air Council is one of the latest innovations in Governmental services. An air council inspection squadron, with headquarters at Croydon, has just been formed." Inquiry at the publicity department of the Air Ministry, however, failed to confirm these statements. The truth appears to be that, as for many months past, a few machines—certainly not a squadron—are at the disposal of the Air Council and that there is nothing new to record.

Much innocent amusement has been caused by the exclusive misinformation given by this journal. It is said that:—

"Each member is permitted to state the class of machine he wishes to fly. There are specially equipped Bristol fighters with coupé seats and De H 10's with limousine cabin in the squadron. General Seely, it is said, wishes to fly every type ever used by the R.A.F. Recently he was supplied with a Bristol monoplane, an obsolete machine for service purposes. He now, it is stated, desires an old F.E.2B, one of the original bombers in the British service.

"Mr. Winston Churchill, although a qualified pilot, has more conservative tastes, and prefers a fool-proof school machine of the Avro type."

The last paragraph does not sound complimentary to Mr. Churchill, who doubtless will be as much amused by the news as everybody else.

Good Wishes.

Everybody concerned with aviation will regret very much to hear that Captain Geoffrey de Havilland is very seriously ill, and is not likely to be able to return to work for a considerable time.

Captain de Havilland first acquired fame as the designer of the original B.E. biplane, which was certainly the best machine of its period. Since then he has done very fine work as the designer of the famous "D. H." series of Airco machines.

His quiet and retiring nature prevented him from becoming a popular figure in aviation, but those who know him esteem him most highly, and all will wish him an early and complete recovery.

Mr. Burroughes' Move.

Mr. Hugh Burroughes, one of the original directors of the Aircraft Manufacturing Co., Ltd., and before that an important member of the staff of the Royal Aircraft Factory, has recently left the Aircraft Manufacturing Co. No official intimation has been given of Mr. Burroughes' future movements, but his experience and success as a business manager are sufficient guarantee that ere long news will be heard of him in some important connection.

The WORLD of AERONAUTICS (continued)

Benzol as Aeroplane Fuel.

An interesting test on a 110 h.p. Le Rhône Avro Scout has just been completed in Lancashire. The results closely follow what has already been found out in connection with motor-cars using this fuel.

Unity may be Weakness.

It is reported that co-operation between Great Britain, America, and France by the formation of an Allied aviation committee of the League of Nations is being advocated.

One is inclined to think that such co-operation would be more likely to hamper than to assist the development of aviation, as it is probable that the main idea would be to reach an agreement to limit the amount of money to be spent by the countries concerned upon service machines. Healthy competition for the future mastery of the air would, one thinks, produce better results than co-operation.

An Absurd Stunt.

An American pilot and photographer recently performed the absurd stunt of diving under the suspension bridge at Niagara Falls. Apparently they had a series of adventures, for owing to unexpected air currents they were unable to rise again as they wished, and had to pass under two more bridges. At the whirlpool the machine was still below the top of the gorge, and a vertical bank had to be made at the right-angled turn of the river, where the aviator narrowly missed hitting the cliffs.

A Flight by Man Power.

An interesting flight by man power is reported from Paris. It was made by the well-known French cyclist, Poulain, who, on August 11th, succeeded in flying twelve metres at a height of one metre. Poulain will attempt another flight on his aviette before officials of the Aero Club de France and will endeavour to win the Peugeot prize of 10,000 francs offered for the first flight of ten metres that is made entirely by man power.

A Basement Needed.

According to the Glasgow "Evening Citizen":—

"Details are to hand of the airship R.80, which has been designed for passenger service from Barrow to Rio de Janeiro. The vessel is of a capacity of 1,250,000 cubic feet, or rather more than half the size of the R.34. She is considered to be the most perfect known streamline shape of airship, while her hull is constructed of special light alloy, 'duralumin' girders.

"The R.80 possesses a cruising speed of 46 and a full-power speed of 60 miles per hour, and is 535 feet in length.

"The passengers' living yuarters are contained on the top of the hull, where are situated a large saloon fitted out lie a Pullman car, a roof garden, and a spelter deck, and cabins of sleeping berths.

"There is an observation car below the hull of the airship, which is connected with the living quarters by means osf a passenger lift through the middle of the ship."

Somebody seems to have been giving a severe tug to the leg of the writer, and the compositor has not been kind. The "passengers' living yuarters," the saloon "lie a Pullman car," the roof garden and spelter deck all reached by means "osf" a passenger lift, all sound almost too good to be true. If only the airship had a basement for the cold storage of American beef it should solve the problem of Commercial Aviation between Barrow and Rio de Janeiro.

A Surprising Affair.

One of the greatest of the troubles of aviators is the starting of the big engines now in vogue, and it is eminently satisfactory to know that this trouble seems to be overcome for ever by a simple little device known as the Herzmark Self-starter, an apparatus which only weighs a matter of 20 lbs. The most surprising thing about the apparatus is that though it only came to England a few weeks ago it has already attracted the attention of the highest aeronautical officials. A matter of a fortnight since Major-General J. E. B. Seely, C.B., C.M.G., D.S.O., Under-Secretary for Air, journeyed specially to Hendon to see it, and demonstrated its fool-proofness by himself causing it to operate successfully three times in succession on a Rolls-Royce engine in an F.K.26 type Bat commercial biplane.

THE LEPAERIAL TRAVEL BUREAU.

During the last two weeks there have been numerous enquiries for flights to Amsterdam, and the majority of the companies taking machines to the Exhibition were able to carry passengers on the machines they were showing. Owing, however, to the delay by the Air Ministry in licensing some of the machines and the short notice of definite dates, and times of starting, the publication of which are highly important if civilian flying is to be a success, there were few bookings.

Among the long-distance flights booked was a round trip, Hounslow-Cowes-Dover-Hounslow: one of the passengers landed at Dover to catch the Ostend boat.

Joy-rides are still popular, not the least b ing the "Over London" trip; the passengers, starting from either Hounslow or Northolt, are brought up over the West-End to the Tower Bridge and St. Paul's and back again, about 30 minutes in the air at a fare of £2 5s. per passenger.

It is now possible to 'phone or call at the Bureau in Piccadilly Circus and hire a taxi-plane to any part of Great Britain at a moment's notice.

The management of the Bureau extend a cordial invitation to all members of the Aircraft Industry to call and inspect the magnificently appointed offices in Piccadilly Circus and would be pleased if they would make use of the office for keeping business appointments—it is certainly one of the coolest spots in London.

For the Attention of the Postmaster-General.

One would like to tell the following facts to the British Postmaster-General, Mr. Illingworth, who recently made the statement that aeroplanes for mail-carrying were of "only 60 per cent. efficiency":—

A record of 99 per cent. was made by the Air Mail Service between Washington and New York for the month of June, covering a mileage of 11,118 and carrying 15,643 lbs. of mail.

On the Cleveland-Chicago division a perfect score of 100 per cent. was obtained. A total of 19,825 miles was run during the month of June on that division and a total of 19,603 lbs. of mail was carried. The average speed on that route for the month was 97.8 miles per hour. The best flying was performed on June 18th, when the round trip from Cleveland to Chicago and return was made in 6 hours and 14 minutes—an average of 104.4 miles an hour in each direction.

The operation of the Cleveland-Chicago route is without a parallel in the history of aviation. The route was started May 15th and has never missed a day—70 consecutive daily non-stop flights of 325 miles each were made without a forced landing. On the 71st trip a petrol connection sprung a leak, causing a forced landing on the emergency air mail landing field at Bryan, Ohio.

On July 4th there were on the mail route between Washington and New York, New York and Cleveland, and Cleveland and Chicago, 10 aeroplanes in flight. The shortest route was 215 miles from New York to Bellefonte, Pa., and the longest route was from Cleveland to Chicago or 325 miles. All 10 aeroplanes scored 100 per cent., arriving and leaving every station on time.

An Air for Airmen.

A weekly newspaper is offering a prize for the best marching air for the Royal Air Force. How to induce the R.A.F. to adopt it will be the next problem. One thinks that the Force will not altogether appreciate the possibly well-meant attentions of the popular press. Marches and songs that would please the populace would in all probability be scorned by the service.

One good result of the war was the death of the old-fashioned sloppy "patriotic" song. One remembers such examples as:—

Hit is ther Nyvy,
Ther British Nyvy,
That keeps our foes at bye.

Very naturally the men in the ranks prefer to march to the lilt of "Another little drink wouldn't do us any harm," or "When you look in her eyes." A march with jazz band effects might catch the fancy of the mob if it included imitations of the drone of a propeller, a Lewis gun, and an occasional crash, but the airman would doubtless prefer one of the old favourites that he sang during the war.

A Removal.

Major-General Sir W. S. Brancker has moved from 13, Little Grosvenor Street, to K.6, The Albany, Piccadilly, W. Telephone: Regent 982.

A Vacancy.

There is a vacancy on the staff of THE AEROPLANE for a competent shorthand-typist who is interested in aviation. Applications should be made by letter only in the first instance to 175, Piccadilly, W.1.

COMING EVENTS.

AUGUST.

Amsterdam Aircraft Exhibition.

Saturday, August 16th.—R.N.A.S. Officers (Hendon) Dinner at the Café Royal.

Thursday, August 21st.—R.A.F. Annual Athletic Meeting at Stamford Bridge.

Sunday, August 24th to Sunday, August 31st.—The "Avenir's" Tour de France Aérien is due to start.

Saturday, August 30th.—Hendon-Brighton-Hendon Air Race at Hendon Aerodrome.

SEPTEMBER.

Monday, September 1st.—Last day for presentation of British machines for the Schneider Cup Competition.

Wednesday, September 10th.—Schneider Cup Competition, Bournemouth.

Saturday, Sept. 20th.—Hendon-Manchester-Hendon Air Race at Hendon Aerodrome.

DATES TO BE ANNOUNCED LATER.

Hendon-Paris-Hendon Air Race.

The "Daily Express" £10,000 Prize Competitions.

AIRCRAFT IN PARLIAMENT

HOUSE OF LORDS.

Earl CURZON, in his speech of thanks to the Services on August 6th, made the following references to the Royal Air Force :—

Every British soldier and every Ally who has been fighting in this war, with the exception of those brave heroes of the air who defended us from aerial attack in this country, has been fighting throughout on foreign soil.

Among those whom this House will be asked to honour with a grant is General Trenchard, the embodiment of the fighting spirit of that glorious force which he led at different times both at home and in the field.

When we compare the tiny fleet of aircraft that flew across the Channel in the first weeks of the war, numbering only 1,000 officers and men and not more than 100 machines, with the vast fleet and the tens of thousands of men who crossed later, we have some measure of the advance which has been made in that great branch of the Service.

The history of the aerial combats in these years of fighting has been a series of epics. Whether we think of the amazing development of the machines or the resourcefulness and incredible audacity of the men, there is no more admirable page in the history of the war.

HOUSE OF COMMONS.

The following written answers were given on August 5th :—

CELLULOSE INQUIRY.

Mr. RAPER asked the Prime Minister when Lord Sumner's Report on the cellulose inquiry will be forthcoming as it was promised before the end of last month.

Mr. BONAR LAW : It is hoped that the Report would be in the hands of the Chancellor of the Exchequer in the course of a few days, and it is certain that it will be forthcoming before the House adjourns.

MISS VIOLET DOUGLAS-PENNANT—(SELECT COMMITTEE).

Mr. BONAR LAW, replying to Sir J Butcher, said that the expenses of the Select Committee would be chargeable to the Vote for House of Lords' Offices, which includes provision for witnesses attending the Committees and shorthand-writers.

* * *

The following written answers were given on August 4th :—

CIVIL AVIATION DEPARTMENT.

Mr. JOYNSON-HICKS asked the Under Secretary of State to the Air Ministry if he can make a statement as to the names, salaries, and working of General Sykes' staff in the Civil Aviation Department.

Major-Gen. SEELY : The following members of the staff of the Civil Aviation Department are being paid the civil rates shown :—

Major-Gen. Sir F. H. Sykes.—£2,000 plus £500 retired pay
Major-Gen. E. D. Swinton.—£1,800 less 10 per cent. deduction on account of pension.
Lieut.-Col. W. O. Raikes.—£1,000.
Mr. G. B. Cockburn.—£800.
Mr. J. M. Pearson.—£280 plus bonus.

Other gentlemen are serving in the Civil Aviation Department as officers, and these are in receipt of Staff rates of pay or pay and allowances of their rank. Letters offering civil appointments in those cases agreed by the Treasury have been sent.

Captain W. BENN asked the Under Secretary of State to the Air Ministry whether he can make a statement regarding the organisation of the Civil Aviation Department, especially the training and licensing of commercial pilots.

Major-Gen. SEELY : As regards the first part of the question, the organisation of the Department of Civil Aviation is proceeding on the general lines indicated in the Memorandum circulated amongst Members by me on April 30th last. Treasury sanction has been obtained for a certain proportion of the staff provisionally asked for by the Air Ministry. Since the date of the Memorandum referred to, all the meteorological services have become part of the Department of Civil Aviation. As regards the second part of the question, the Department of Civil Aviation does not undertake the training of pilots, but it licenses pilots possessing the qualifications prescribed in the Air Navigation Regulations.

AIR REGULATIONS (ENFORCEMENT)

Mr. JOYNSON-HICKS asked the Under Secretary of State to the Air Ministry whether he is making any arrangement in the nature of an air police force for ensuring obedience to the air Regulations.

Major- Gen. SEELY : Arrangements have been made in order to ensure, as far as possible, that breaches of the air regulations are reported to the Controller-General of Civil Aviation. It is not considered that the expense involved in maintaining an air police force would be justified at the present stage.

* * *

The following written answers were given on August 6th :—

CONSTRUCTION (TRANSFERENCE).

Captain W. BENN asked, separately, the Under Secretary of State to the Air Ministry and the First Lord of the Admiralty whether they could make a statement explaining the Government policy relating to the transference of the construction of lighter-than-air craft from the Admiralty to the Air Ministry; but neither could add anything further to previous answers given on July 31st.

WAR SERVICES—THANKS OF PARLIAMENT.

The PRIME MINISTER, in moving a vote of thanks to the Services on August 6th, made the following references to the Royal Air Force :—

I beg to move that the thanks of this House be accorded to the officers, non-commissioned officers and men of the Air Force for their brilliant daring and conspicuous services over sea and land

SUPPLY—GRANTS TO OFFICERS.

On August 6th a Motion was made and a Question proposed that a sum, not exceeding £585,000, be granted to His Majesty, to be issued to those officers who commanded and directed His forces by sea, on land, and in the air, in recognition of their eminent services during the late war, namely (among others) :—

Air :

Air Vice-Marshal Sir Hugh Trenchard ... ... £10 000.

The PRIME MINISTER in his speech said : As for Air Vice-Marshal Trenchard, he, by his energy and daring and drive and imagination and magnetism, which make for great leadership in war, made the Air Force become the powerful and formidable fighting machine that it was.

Mr. JOYNSON-HICKS : There is another name which should be mentioned in this list, whether it be in the form of a money reward or those other honours which have been announced in this morning's papers—I refer to General Sir Frederick Sykes, of the Royal Air Force. The Royal Air Force has been a great object in my life for years past, and I have gloried in its successes during the war.

The words which the Prime Minister spoke with regard to General Trenchard are none too high. We all know the magnificent work he has performed, and the inestimable service his spirit gave to the young men of the corps. They all swore by him, and when he gave an order they were always ready to go and carry it out. I am very pleased to see the Under Secretary for Air present this afternoon. He knows the very great services which General Sykes rendered at the time when General Trenchard resigned his post and General Sykes was appointed to take the command in the field, and the very good services which he performed.

I ask whoever is taking charge on behalf of the Government to mention these two names to the Prime Minister, and if they have been overlooked I ask that the matter may be reconsidered, and I feel by including them you will be doing honour not merely to those generals but to the whole community at large.

[As a matter of fact General Sykes was Chief of the Air Staff, and did *not* command in the field.—ED.]

* * *

The following written answers were given on August 7th :—

AERODROMES AND OFFICES (RELINQUISHMENT).

Captain W. BENN asked the Under Secretary of State to the Air Ministry what reductions have been made recently in the number of aerodromes in use and the hotels and offices occupied by the Ministry.

Major-Gen. SEELY : Between July 2nd and August 6th, 1919, one aerodrome, five seaplane stations, and thirteen landing-grounds have been notified to the Directorate of Lands as available for relinquishment or to be disposed of, making a total of fifty-two aerodromes, eleven seaplane stations, and 147 landing-grounds, so devised since November 11th, 1918. The Hotel Cecil, the only hotel now in the occupation of the Air Ministry, will be evacuated on August 13th, 1919. The offices at 5, John Street, Adelphi, will be evacuated on August 9th, 1919.

The following hotels and offices have been given up by the Air Ministry within the last five months :—

Cavendish Hotel, evacuated January 10th, 1919. 4-6, Adam Street, evacuated March 22nd, 1919. Adelphi Hotel, evacuated April 5th, 1919. 5 and 7, John Street, Adelphi, evacuated April 5th, 1919. Covent Garden Hotel, evacuated April 14th, 1919.

The number of hired premises in use by the Royal Air Force at the date of the Armistice was 2,143; by August 1st, 1919, 1,899 of these had been given up.

CIVILIAN AVIATION (CONDITIONS).

Sir HERBERT NIELD asked the President of the Board of Trade whether any licence or other permit is necessary to enable civilian-owned aircraft to be exercised and flown; whether any regulations have been made with regard to the conditions under which such flying is authorised, and what, if any, security is required or other provision made for the payment of or indemity against damage to life or injury to persons or property resulting from accidents caused by the fall of aircraft or from anything dropped from aircraft while in the course of flight; and whether there is any and what provision for the identification of such aircraft in cases where the injury is caused by anything so dropped.

Major-Gen. SEELY : The conditions governing civilian flying are laid down in the Air Navigation Regulations, 1919 (Statutory Rules and Orders, 1919, No. 525). These regulations provide, inter alia, that all aircraft must be registered and bear a registration mark, that aircraft carrying passengers for hire or reward must be certified airworthy, and that all pilots flying aircraft must be licensed. There is no special provision in the Regulations as to liability in respect of accidents. Conditions are imposed as to the display of the registration mark with a view to facilitating the identification of aircraft. Damage caused by aircraft is recoverable by ordinary process of law as in the case of damage caused by any other means.

* * *

The following written answer was given on Aug. 8th :—

ANTI-AIRCRAFT STATION, SHIPBOURNE.

Mr. BENNETT asked the Secretary of State for War if there is now any necessity for the anti-aircraft station at Shipbourne, Sevenoaks; and if he will give instructions for its early removal, inasmuch as the huts and gun prevent the villagers from using the village green for cricket and other accustomed sports.

Mr. CHURCHILL : Instructions are about to be issued for the abolition of the anti-aircraft station at Shipbourne.

* * *

The following is taken from the "Times" :—

On August 4th Mr. RAPER asked the Under Secretary to the Air Ministry what steps he proposed to take to punish all persons in or connected with the Air Force, no matter what their positions, found guilty of corrupt practice in connection with the Air Force contracts by the Select Committee on National Expenditure, and whether, in view of recent disclosures, he would now, without further delay, form a small committee of two or three Members of the House having real business experience, and two or three other experienced business men outside the House to supervise the placing and execution of all future Air Force contracts.

Major.-Gen. SEELY : Every possible step has already been taken and will be taken in future to bring to justice any person in, or connected with, the Air Force guilty of corrupt practices regarding Air Force contracts or in any other matter. I am not disposed to adopt the suggestion contained in the last part of the question. I intend to make a statement on the matter in the course of to-morrow's debate.

Mr. RAPER : Does the right hon. gentleman propose to take steps to prosecute those referred to in the report of the Select Committee?

Major-Gen. SEELY : Since I have been at the Air Ministry, wherever there has been any case of corruption I have at once given orders that a prosecution shall take place, if a prosecution can lie. I propose to continue that practice.

Mr. RAPER : Is it not a fact that, in connection with the instances mentioned in the report, the Government decided, for reasons of their own, not to institute proceedings?

Major-Gen. SEELY : No, sir. I presume my hon. friend is referring to two cases. One was the case referred to by Sir John Hunter, in which I gave instructions myself personally that a prosecution was to take place if a prosecution would lie. I gave these instructions precisely twice to Sir John Hunter, who was then acting under my directions. The Lord Advocate for Scotland decided that a prosecution would not lie. So far as the Air Ministry is concerned the facts are as I have stated, that wherever there has been the possibility of pro-

secution a prosecution has been ordered. The other was the case of Miss O'Sullivan, who made allegations of corruption. The very day these allegations were brought before the Select Committee, presided over by the right hon. baronet, the Member for the City of London, I ordered an inquiry to be held, which is now proceeding. If there is ground for prosecution—that is, of course, a legal matter—that prosecution will take place.

Mr. G. LAMBERT: May I ask the Leader of the House whether if, with Mr. Speaker's permission, this matter is raised to-morrow as to the prosecution of these officials in the Air Service, the Lord Advocate will be here to defend his somewhat inexplicable action?

Mr. BONAR LAW: I shall make inquiry, but I entirely agree with my right hon. friend that a discussion on that point would be very ineffective unless we hear the Lord Advocate's own explanation of what are his reasons.

Mr BILLING asked whether the officers named by Sir John Hunter were still in the employment of the Air Service, and, if so, what positions did they occupy.

Major-Gen. SEELY: I do not carry the facts in my mind, and I must have notice of the question as to the particular officers the hon. Member refers to. But I repeat that our policy has been throughout—mine especially—that wherever there could be any question of improper or corrupt dealings a prosecution is at once ordered.

Mr. BILLING asked whether, having regard to the fact that the only reason that these officers had not been prosecuted was owing to a technicality, the right hon. gentleman could see that if they occupied any position of trust they should be forthwith dismissed.

Major-Gen. SEELY: Certainly not. Are we to assume that a man is guilty before he is found to be so by a process of law? I cannot carry in my mind who all these people are, but in trying to do what is right in the interests of the State we must do right to the individual.

Replying to a question from Mr. BRIANT Major-Gen. SEELY said: The information I received from the Lord Advocate was that a prosecution would not succeed. When it was suggested to me that possibly it might bring into disrepute the representatives of either Sir John Hunter or any other officials, I said at once that that had nothing whatever to do with the case, but I confess I do not understand the particular point. The Lord Advocate is not present in the House, but no doubt it will be cleared up to-morrow. I say at once that such an idea never entered my head or the head of anyone responsible at the Air Ministry. All we want to do is to get at the truth.

Sir F. BANBURY: This matter was the subject of inquiry so long ago as March. No inquiry was granted until June, and then the inquiry was commenced, but was not finished, owing to the fact that Miss O'Sullivan had not signed her evidence, and no further steps were taken until it was made evident to the Air Ministry that inquiries were going on before the Select Committee, and it was then, and then only, on the 25th of last month, that an inquiry was instituted by the Air Ministry.

Major-Gen. SEELY: I have said again and again in this House that if in this matter, which affects what is called the "Douglas-Pennant case," any specific charge of corruption could be made, it would be at once inquired into. I have again and again asked for a specific statement. It was not given. The moment it was given in response to a question asked by the Select Committee, that very same day an inquiry was ordered.

Captain WEDGWOOD BENN: Who is the Secretary of State for Air, and why is he not here to answer these matters? Will he be here to-morrow?

Mr. BONAR LAW: He will certainly be here to-morrow, and I am quite sure my right hon. friend will be glad to have an opportunity of stating the policy of the Air Ministry in this matter.

Mr. STEWART: If there is any prosecution possible will it be under Scottish law or English law, and is the law of evidence the same in Scotland as in England?

No answer was given.

Mr. MacVEAGH: Will the right hon. gentleman, in the inquiry which he is now conducting, inquire into the conduct of the official who threatened to dismiss Miss O'Sullivan for making this report?

Major-Gen. SEELY: Yes, certainly.

Lord ROBERT CECIL rose, but the SPEAKER said that any further questions had better be left over for discussion to-morrow.

EXPENDITURE BY THE AIR MINISTRY.

"The Third Report from the Select Committee on National Expenditure" (No. 168, printed Aug. 7th, 1919) deals in the main with expenditure controlled by the Air Ministry. The inefficiency of various branches of that Ministry, well known to those behind the veil of official life, is revealed in some degree to the public in this paper. The two principal subjects dealt with by the Committee were the construction of aerodromes and the issuing of a contract for the supply of uniform to W.R.A.F. personnel.

In regard to the construction and laying out of aerodromes Sir John Hunter, K.B.E., lately Administrator of Works and Buildings, was examined. He stated that he had found much evidence of fraud in the carrying out of this work. '. . . He was of opinion [for instance] that no man who had been employed on the erection of aerodromes had earned the money he received." Speaking generally, he including the whole number employed—70,000 men—in this charge. At Renfrew he found evidence of conspiracy between a Government official and three of the contractors' men, and suspected that the contractor himself might also be involved. Four men were arrested and were held on bail for four months, "but the Crown authorities declined to prosecute and the men were freed from charge on June 7th." A civil action was being entered against the contractor concerned for about £50,000.

The Lord Advocate had refused to prosecute in the case above referred to because, he said, "There is no evidence at all that any of the accused applied to their own uses any of the money said to have been improperly obtained from the Ministry. This circumstance, though it does not in itself provide an answer to a charge of fraud, makes the insufficiency of evidence more formidable than would otherwise be the case. Further, a prosecution would reveal what appears to be inefficiency and absence of control on the part of the representatives of the Ministry on the spot."

Sir John Hunter, in a letter of protest to the Air Ministry in regard to the position adopted by the Lord Advocate, said:—

"I find it very difficult to understand how a criminal charge cannot be formulated and a conviction obtained, having regard to the admissions made, and in some cases signed by persons charged. It is admitted that the books or time-sheets were falsified by entering thereon the names of men said to be employed on the job, but who did not, in fact, exist. Wages were drawn regularly and charged to the Government as having been paid to these men. Where did that money go? The Lord Advocate says there is no evidence that any of the accused 'applied to their own uses any of the money said to have been improperly obtained from the Air Ministry.' But would not any jury on the facts above stated draw the obvious inference that the persons responsible for putting these 'dead men' on the books and drawing wages regularly for them from Government funds had, in fact, put the money in their own pockets? And is there not evidence that this was done with the connivance of the Clerk of Works?

"But I wish to carry the matter further and to point out that the position, if no prosecution is attempted, is in my opinion more serious for the Air Ministry than if a prosecution should be started and fail, and I wish to explain the position so that it may be put before the Lord Advocate. After a personal inquiry, on making the discovery of these irregularities, I informed the contractors that I would not authorise payment to them of commission in accordance with the terms of their contract, but would have the whole job measured up and pay them on such measurement on proper rates. Mr. Cowieson (the head of the firm of contractors), at an interview which I had with him and his law agent, agreed to this, and later agreed by letter. A firm of measurers were engaged by me, and their work is now practically complete, and it appears that already there is a sum of about £60,000 charged by the contractors to the job which cannot be accounted for."

Despite this protest the Lord Advocate still refused to prosecute and has not since altered his attitude in regard to the case.

Other references to dishonest practices were made by Sir John Hunter and his cross-examination was closed.

Miss O'Sullivan, Clothing Controller to the W.R.A.F., was examined as to the placing of contracts for W.R.A.F. uniform with a Manchester firm.

She said that a contract for 30,000 coat frocks and 30,000 overcoats was placed with this firm (Messrs. Cohen and Wilks), despite the fact a pattern uniform sent in by Messrs. Kenneth Durward had been selected by the Committee deciding these matters.

"11. She also stated that the deliveries of the article in question were dilatory and not up to sample, the garments being amongst other things badly cut.'

"12. By direction of Miss Douglas-Pennant, who was then Commandant of the W.R.A.F., the Clothing Controller went to Manchester and she stated that the coat frocks were being cut on the bias instead of on the straight; this course, if pursued, would have resulted in the saving to the contractor of about three-quarters of a yard on each garment. According to the contract, payment was to be made for 3 yards 24 inches of cloth on each garment."

Various officers were cross-examined as to the placing of this contract, and as to the removal of Miss O'Sullivan from the work of inspection. The evidence given by two officers and the lack of evidence given by a third, who did not obey the Committee's request to appear before it, was regarded as unsatisfactory.

"28. The Sub-Committee examined Major-General Sir H. Trenchard (Chief of the Air Staff) and are of opinion that he is doing all that is possible to cut down expenditure while having due regard to the efficiency of his Department."

The rest of the report deals with the Finance Department, which "is very satisfactorily conducted," and to motor vehicles.

Too much stress should not be laid on the scandals revealed in this report. Irregularities small or great are bound to occur in a Ministry improvised during a great war from personnel the majority of whom have had but little experience of Government work and who all too frequently lack that stability and proved honesty which are the pride of the regular military and civil services.

THE CASE OF MISS DOUGLAS-PENNANT.

The Committee of Inquiry, which has been formed by the House of Lords to inquire into the dismissal of Miss Douglas-Pennant from the W.R.A.F., will consist of five members. Lord Kintore, Chairman of Committees in the House of Lords, Lord Askwith, Lord Gainford, and Lord Denbigh are four of the members.

It was unofficially stated on Aug. 8th that the Government has intimated its desire to be represented on the Select Committee.

NAVAL & MILITARY AERONAUTICS

GREAT BRITAIN.

FROM THE COURT CIRCULAR.

BUCKINGHAM PALACE, August 6th.

The Prince Albert, attended by Major Louis Greig, was present at the Royal Air Force (South-Eastern Area) Athletic Sports at the Queen's Club, West Kensington, this afternoon, and afterwards handed the Prizes to the successful competitors

BUCKINGHAM PALACE, August 11th.

Air Vice-Marshal Sir Hugh Trenchard, Chief of the Air Staff, had the honour of being received by the King this morning.

NAVAL

Lieut. C. Lansdowne, R.A.F., and Lieut. Marshall, R.A.F., were out on a bombing expedition over the Bolshevik lines on the Dvina on July 14th, when their seaplane was damaged by machine-gun fire and forced to descend.

They destroyed the seaplane, and started to swim back to the British lines, but had barely covered a mile when a Bolshevist patrol appeared and forced them to surrender. They were taken to the enemy headquarters at Puchega, and are reported safe and well.

* * *

The Air Ministry issued the official story of Major Sitwell's flight on August 7th, most of this having already been noted in THE AEROPLANE. The following would appear to be fresh information :—

Strong head winds were met with during the flight from Copenhagen to Reval, and as petrol threatened to run short a course was set towards Stockholm. On the west side of Gotland, however, a following wind was picked up, and the flight was continued to Reval, which was reached at 6.15 p.m. on July 20th.

On July 21st the last stage of the journey was flown in much improved weather, and the total journey of over 1,100 miles from Felixstowe to Helsingfors was completed in sixteen flying hours.

A very warm reception was accorded to the British flying officers and crew by the Finns. The Cross of the White Rose of Finland was conferred upon Major Sitwell and Captain Bailey.

Facilities were accorded for inspection of the flying-boat and demonstration flights were given each day to prominent Finns and representatives of the Finnish Press. Among those taken up were: Herr Castren, the Premier; General Kivekas, Chief of Staff of the Finnish army; Herr Holsti, the Minister of Foreign Affairs; and the Ministers of Commerce, of Communications, and Aviation.

This flight is all the more interesting owing to the fact that the boat is three years old, having been built at Felixstowe during the late war.

The British inhabitants of Reval are stated to have been extremely pleased to receive newspapers which were merely two days old instead of nine.

* * *

The following has been received from the Danish correspondent of THE AEROPLANE :—

While the British flying-boats to carry out the Scandinavian circuit have long been expected, another F.5 N.90 turned up last Saturday, July 19th, establishing the first after-war non-stop flight between England and Denmark. Under the command of Major Sitwell, and with Captain Bailey as pilot, the flying-boat followed a course over Holland, Cuxhaven, and the Kiel channel, the Danish islands Lolland and Falster, and landed by the Naval Air Station at the Royal Dockyard in Copenhagen. She carried beside the two N.C.Os. a representative of the Foreign Office, as the flying-boat was on courier service to Finland. Having replenished the petrol tanks with 1,000 kg. fuel, F.5 N.90 started on Sunday, July 20th, duly arriving at Helsingfors *via* Reval.

* * *

The following has also been received from the Danish correspondent of THE AEROPLANE :—

The show flight to the Scandinavian capitals was started upon, F.5 N.4044 flying first from Felixstowe to Christiania, where it was to wait for a sister companion. It filled in the time with trips, the passengers including H.M. Queen Maud and Crown Prince Olav of Norway. On the next stage to Copenhagen a wire broke, so the craft landed at the Norwegian Air Station at Horten, stopping overnight, and, as the British Legation at Copenhagen was not informed, a fatal accident was feared, and Danish naval aircraft were preparing to go out to search in the Kattegat Sea, when the flying-boat turned up safely at noon, July 29th, at the Danish capital. N. 4044 is under command of Major Galpin, with Captain Scott as pilot, the crew including further one wireless operator and one mechanic. F.5 N.4044 will next proceed to Stockholm, returning to England *via* the Swedish Göta Canal and the Danish city Esbjerg. Demonstration flights are given in Copenhagen to various persons of the Press, the Army and Navy, and the mail service concerned with aviation.

* * *

On Aug. 3rd the British Naval flying-boat F.5/4044 (Major C. T. Galpin, D.S.O., R.A.F.), arrived at Stockholm from Copenhagen. Her arrival caused much excitement among the populace. On Aug. 5th the same boat left Gothenburg for Esbjerg on her return flight to England, having made a tour of Scandinavia. She arrived at Esbjerg at 8 a.m. on Aug. 6th, and left at noon for Felixstowe.

* * *

H.M.A. R.33 will very probably start to fly to India within the week. The route this ship will take was announced some little time ago.

* * *

The British Naval triplane flying-boat, known as the "Felixstowe Fury," was completely wrecked on Aug. 11th, whilst undergoing tests. Her crew at the time of accident was Wing Comdr. Fellowes, R.A.F. (in command), Squadron Leader E. R. Moon, R.A.F., and Flight Lieut. Scott, R.A.F. (pilots), Flying Officers Armitt and S. E. S. McLeod, R.A.F., Serjt.-Major Cockburn, R.A.F., and one Locker, whose rank is hitherto unstated. Flying Officer McLeod was drowned.

The boat had started from Felixstowe Aerodrome at 9.15 a.m. en route for Portsmouth, and taxied towards Landguard Point. Then she turned into the wind. She narrowly missed fouling one of the buoys in the harbour and made a sudden stop.

An endeavour was next made to clear the river boat "Norfolk," and it was then she took a couple of leaps out of the water and finally struck the water with her nose and one wing and sank, her tail sticking out. Flying Officer McLeod, who was strapped in, was drowned, and two others of the crew were injured. Later in the day motor launches towed the wreckage back to the aerodrome.

The accident took place within 500 yards of the aerodrome, and an eyewitness declared that the boat had only just lifted herself from the water when the mishap occurred. Another eyewitness said that she appeared to be too heavy, and side-slipped and dived into the water.

The inquest was held at Felixstowe the same afternoon on Flying Officer Samuel Evans Smith McLeod, R.A.F., aged 30, who was acting as wireless operator. It was stated the "Fury" left the slipways all right, but when about 15 ft. up she fell and submerged the crew.

Lieut. G. J. O. Mullane, R.A.F., stated that he witnessed the accident. The seaplane left the harbour and veered round to the wind, which was blowing due north. She was travelling about 40 miles an hour. She rose from the water twice to a height of about 15 ft., and on rebounding a second time the left wing dropped and caught the water, bringing her nose round to port. This caused her to dive. In witness's opinion, her hull was smashed and deceased was entangled in the wires.

Capt. Charles Langston Scott, R.A.F., who was on board, corroborated the last witness. The deceased had been a Felixstowe station six months. A verdict of accidental death was returned.

The "Felixstowe Fury" had five Rolls-Royce engines with a total of 1,800 horse-power. She was designed by Colonel J. C. Porte, C.M.G., R.A.F., and took two years to build. At the time of her construction she was the largest triplane in existence, and it was at first intended that she should cross the Atlantic. She was on her way to Portsmouth preparatory to flying to the Near East when the accident occurred.

MILITARY.

WAR OFFICE, August 2nd.

REGULAR FORCES ESTABLISHMENTS.—R.F.C.—Mil. Wing.—Flying Officers.—The appointment of Sec. Lt. M. McGall (5th R. Sc. Fus., T.F.) is antedated to April 15th, 1917.

The name of temp. Sec. Lt. William Armstrong is as now described, and not William Austin Armstrong as in "Gazette," April 18th, 1918.

Instr. in Gunnery.—Graded as an Equipment Officer, 1st Class.—Temp. Lt. A. W. Furbank, Gen. List, from an Asst. Instr. in Gunnery (graded as an Equipment Officer, 3rd Class), and to be temp. Capt. while so empld., March 30th, 1918.

Equipment Officer, 1st Class.—Temp. Capt T. A. Ross, R.E., from an Equipment Officer, 3rd Class, and to be temp. Capt. while so empld., Jan. 28th, 1918.

Overseas Forces.—Canada.—Quebec R.—The following temp. Lts. (actg. Capts.) cease to be secd. for duty with the Air Ministry, Dept. of Works and Bldgs., and relinquish the actg. rank of Capt.:—W. J. Leslie, A. M. Hudson, Aug. 2nd.

Western Ontario R.—Temp. Lt. (actg. Capt.) R. R. Pigott ceases to be secd. for duty with the Air Ministry, Dept. of Works and Bldgs., and relinquishes the actg. rank of Capt., Aug. 2nd.

Alberta R.—Temp. Lt. (actg. Capt.) B. Y. Jackson ceases to be secd. for duty with the Air Ministry, Dept. of Works and Bldgs, and relinquishes the actg. rank of Capt., Aug. 2nd.

Brit. Columbia R.—Temp. Capt. P. J. D. de Latour ceases to be secd. for duty with the Air Ministry, Dept. of Works and Bldgs., and retires in the British Isles, Aug. 2nd.

Nova Scotia R.—Temp. Lt E. J. Cronin ceases to be secd for duty with R.A.F., July 14th.

E. Ontario R.—Temp. Lt. N. G. Reynolds ceases to be secd for duty with R.A.F., July 14th.

2nd Centl. Ontario R.—Temp Lt. R. A. Adams ceases to be secd. for duty with R.A.F., July 14th.

Saskatchewan R.—Temp. Lt. J. H. Wensley ceases to be secd. for duty with R.A.F., July 20th.

Brit. Col. R.—Temp. Lt. R. H. Schroeder ceases to be secd. for duty with the C.A.F., and also relinquishes grading as Flying Officer, July 17th.

Can. Forestry Corps.—Temp. Lt. D. Neil ceases to be secd. for duty with the R.A.F., July 14th.

Territorial Force.—Royal Garrison Artillery.—Lts. to be Capts.:—Temp. Capt, (R.A.F.) R. W. A. de H. Haigh (Glam. R.G.A.), and to remain secd., Oct. 31st, 1918.

Infantry.—5th Bn. Somerset L.I.—Sec. Lt. S. D. Mason (R.A.F.) to be Adjt. and to be actg. Capt., with pay and allowances of Lt. whilst so empld., March 3rd.

War Office, August 5th.

Regular Forces.—Cavalry.—11th Hrs.—Lt. R. C. Williams (attd. R.A.F.) resigns his commn., Aug. 6th.

Infantry.—Yorks. L.I.—Capt and Bt. Maj. C. E. C. Rabagliati. M.C., A.F.C., resigns his comn., Aug. 6th.

War Office, Aug. 8th.

Regular Forces.—R.F.C.—Mil. Wing.—Flying Officer.—The name of temp. Sec. Lt H. A. Leppan is as now described, and not L. H. Angus, as in "Gazette," May 10th, 1918.

Gen. List.—The name of temp. Sec. Lt. Hilton Angus Leppan is as now described, and not Leppan Hulton Angus, as in "Gazette," Oct. 25th, 1917.

Memorandum.—Air Vice-Marshal Sir H. M. Trenchard, K.C.B., D.S.O., Chief of the Air Staff, to be Col. of the R. Scots Fus., July 15th.

War Office, August 9th.

Regular Forces—Establishments.—Cavalry.—15th Hrs.—Capt. and Bt. Col. Sir F. H. Sykes, K.C.B., C.M.G., is placed on retired list on appointment to a permanent commission in the R.A.F., April 12th.

War Office, August 11th.

A despatch dated June 28th from Field-Marshal Sir Edmund Allenby, Commander-in-Chief, the Egyptian Expeditionary Force, has been received by the Secretary of State for War. The despatch summarises the campaign in Syria and Palestine, and the following reference is made to the work of the Royal Air Force. "... the superiority established by the air force over the enemy was one of the great factors of the successes of my troops.

Official Communiqués.

The War Office issued the following statement on August 5th.

General Maynard reports that a successful raid was carried out on August 2nd by combined forces of land, sea, and air, with the object of striking a surprise blow at the enemy's lake flotilla on Lake Onega, and of capturing the port of Talvuiski, 40 miles south-east of Medvyejya Gora.

The operation proved entirely successful.

The India Office made the following announcement on Aug. 8th:—

The Government of India have informed the Secretary of State that peace with Afghanistan was signed at 11 a.m., Friday, Aug. 8th.

AIR FORCE.

Air Ministry, August 1st.

R.A.F.—The attention of the officers named in this "Gazette" is directed to the Air Ministry Weekly Order, now in course of issue, relating to the grant of permanent commns. and to the new rates and conditions of pay and other emoluments.

The following are granted permanent commns. in the R.A.F. in the ranks stated, August 1st:—

Lieutenants.

R. I. Hartley (T.); C. F. Chinery (T.); E. H. Rundle (T.); C. H. Potts (T.); H. H. S. Scott, D.S.M. (T.).

E. Whittlesea (T.); S. T. Littleton (T.); H. J. Brown (T.); P. Coyle (T.); J. Noonan, D.S.M. (T.); T. S. Jobling (T.); R. D. McE. Hart (T.); R. G. Gore (T.); A. P. White (T.); C. O. Towler (T.) C. E. Whinney (T.); H. W. St. John, D.F.C. (O.); W. A. Coryton (A.); A. G. Quinnell (Ad.); R. Pyne (A.); H. K. Goode, D.S.O., D.F.C. (A.); J. Clover (O.); H. E. King (A.); W. J. Millan (A.); E. S. B. Clarke (A.); G. S. Taylor (A.); C. S. Gray (A.); R. Menzies (A.); J. Bradbury (A.); D. A. Cox (O.); G. A. R. Muschamp (A.); H. G. McKechnie (T.); W. K. Rose (A. and S.); R. A. Whyte (A. and S.); A. E. Gooch (T.); F. A. Skoulding (T.); R. Jones, M.C. (A.); J. E. Kendrick, D.F.C. (O.); I. Whitford (A.); R. H. Haworth-Booth, D.F.C. (A.); J. A. G. Haslam, M.C., D.F.C. (O.); J. S. Harrison (O.); E. G. Gaff (A.); V. Croome (A.); F. G. Prince (A.); J. A. Elliott (T.); O. G. Gregson (A.); C. A. Horn (O.); J. Blackford (A.); J. W. Lissett (A.); W. E. Dipple (A. and S.); H. E. Falkner (O.); F. T. Eades (O.); G. M. Lawson, M.C. (O.); D. S. Robertson (A.); W. S. Allen (T.); B. F. Deane (O.).

J. V. Gascoyne, D.F.C. (A.); L. B. Duggan (A. and S.); J. Parsons (T.); H. J. Bradley (A. and S.); J. S. Nichol (O.); R. H. F. de V. S. Somerset (A. and S.); D. Wood (A.); G. W. Birkinshaw (A. and S.); E. Brewerton (A. and S.); G. McCormack (O.); G. P. H. Carter (A.); C. Walker (O.); K. L. Harris (A.); H. Dawes, M.B.E. (S.O.); S. C. Black (A.); R. J. Willson (O.); J. Cafferkey (A.); M. C. Trench (O.); F. K. Damant (A.); F. J. Smith, M.C., M.M. (O.); C. A. Spence (A.); E. B. Green, M.C. (O.); S. J. Smetham (S.); P. N. Melitus (O.); E. H. Searle (A. and S.); L. RECRUITING IN THE ROYAL AIR FORCE.

It is now desired that in order to complete existing establishments in the Royal Air Force, an additional 15,000 skilled men should be enlisted within the next three months. The men selected will be of good character who will help to make the Royal Air Force the great Service it is intended to be in the future.

There are many reasons why men skilled in aeronautical trades should consider seriously the desirability of joining the Royal Air Force.

The pay offered is equal, if not superior, to that offered in civil life. The permanence of employment is assured with the certainty of an adequate pension to those who remain the allotted time in the Service. Food, clothing and medical attendance, expensive in civil life, cost nothing to those in the R.A.F.

The prospects of employment under present conditions in civil aviation are not good, and it is likely that many good men may, from lack of aeronautical work, drift into other trades totally unconnected with the Industry in which their interest lies.

Civil aeronautics will improve rapidly, and, in the course of a few years, there will be many opportunities of obtaining good positions in the Aircraft Industry for those who have used their time in the Royal Air Force to the best advantage.

THE BRITISH WAR MEDAL.

The Air Ministry made the following announcement on Aug. 10th :—

A preliminary issue of two inches of the riband will be made to all Air Force personnel who are entitled to the British War Medal, on the understanding that such issue does not confirm the title of the recipient to the subsequent award of the medal.

In view of the numbers entitled to participate in the issue, some considerable time must necessarily elapse before the issue is completed. Every effort is, however, being made to accomplish this as soon as possible.

Officers demobilised or invalided should make application to the Secretary, Air Ministry, stating full particulars of their services.

Discharged and demobilised airmen should apply to the Officer i/c Records, R.A.F., Blandford, as follows :—

(a) Those resident in Great Britain, Ireland, Channel Islands and Isle of Man, on the special R.A.F. post-card (F.S. Form 758) obtainable at any post-office.

The Army post-card (Army Form W 5100 A) will not be accepted, neither will any other form of application.

(b) Those resident abroad, by an ordinary letter giving full particulars regarding official number, rank, unit in which last served, and the address to which the riband should be sent.

Discharged and demobilised members of the W.R.A.F. should apply by letter giving full particulars of their service, to the Officer i/c W.R.A.F. Records, 15, St. George's Square, S.W.1.

Members of women's formations who have been employed under a direct contract of service with the R.A.F. Medical Service should apply to the Secretary (D.M.S.) Air Ministry.

Officers and men of the R.N.A.S. who were discharged prior to April 1st, 1918, and those who did not transfer to the R.A.F., will be dealt with in an Admiralty announcement which will be published in due course.

A FINANCIAL APPOINTMENT.

It is announced by the Air Ministry that the Marquess of Londonderry, Finance Member of the Air Council, has appointed Mr. E. F. Cliff to be his Private Secretary, vice Capt. Lord E. A. Grosvenor, R.A.F., with effect from July 22nd, 1919.

THE PIGEON SERVICE R.A.F.

The Air Ministry has recently issued an official handbook on the work of the pigeon service during the war. The handbook, which is entitled "The Pigeon Service Manual," is obtainable from any bookseller, and is a comprehensive book on pigeons.

Attention is once more drawn to the fact that owing to the use of messenger pigeons by the Royal Air Force it is exceedingly thoughtless—to say the least of it—of persons to shoot pigeons, and in the future, when commercial aircraft also use these birds, it will be still more so. The R.A.F. has no intention of disposing of its pigeons.

EVACUATIONS.

The Hotel Cecil, the only hotel now occupied by the Air Ministry, will be relinquished during the week. The offices at 5, John Street, Adelphi, were relinquished on Aug. 9th. Out of the 2,143 hired premises occupied by the Air Ministry at the Armistice 1,899 had been given up by Aug. 1st.

Major-General Seely states that between July 2nd and Aug. 6th this year one aerodrome, five seaplane stations, and 13 landing grounds have been given up, making a total of 52 aerodromes, 11 seaplane stations, and 147 landing grounds surrendered since the Armistice.

RUSSIA.

OFFICIAL COMMUNIQUÉS (BOLSHEVIK).

UNDATED.—In the Gulf of Finland, enemy aeroplanes dropped bombs on the Fortress of Kronstadt.

AUG. 9th.—Eastern Front.—Enemy aeroplanes have dropped 100 bombs on the town of Cherny-Yar.

PERSONAL NOTICES.

MILITARY.

MARRIAGES.

BELL-IRVING—PYBUS.—On Aug. 5th, at Vancouver, B.C., Major Allan Duncan Bell-Irving, M.C., Croix de Guerre, Gordon Highlanders and R.A.F., was married to Mary E. Keith Falconer, daughter of Commander H. Pybus, R.N.R., and Mrs. Pybus, Vancouver, B.C.

MATHER—WHITLOCK.—On Aug. 2nd, at St. Martin-in-the-Fields, Harry Mather, late Lieut., R.F.C., eldest son of Walter Mather, Esq., Brierfield, was married to Chôtee, elder daughter of Lieut.-Col. G. F. A. Whitlock, C.B.E., R.E., 30, Winn Road, Southampton, by the Rev. H. T. Matthews.

MAUDUIT—BROOKSBANK.—On Aug. 7th, at St. Andrew's, Middleton-on-the-Wolds, Capt. R. F. S. Mauduit, M.C., late R.F.C., son of Lieut.-Col. Mauduit, was married to Irene Helen Brooksbank, daughter of the late Capt. A. H. Brooksbank and Mrs. A. H. Brooksbank, of Middleton-on-the-Wolds, by the Right Rev. the Bishop of Hull, assisted by Canon Blakeney and the Rev. E. T. Wilson, Rector.

SPENCER—PATTMAN.—On Aug. 6th, at All Saints', Scarborough, Lieut. Lionel R. V. Spencer, Aust. F.C., son of Mr. R. Spencer, of the Old White Hart Hotel, Melbourne, was married to Dorothy Cecelia, eldest daughter of Mr. G. T. Pattman, the eminent organist, and Mrs. Pattman, by the Lord Bishop of Aberdeen, assisted by the Rev. W. F. Ramsden.

ENGAGEMENT.

SHIRLEY—PARNALL.—The marriage arranged between Capt. J. L. Shirley, M.C., late 34th Squadron, R.F.C., and Miss Kathleen Parnall, of Rugby, will take place at the Parish Church, Rugby, at 12.30 p.m. on Tuesday, Sept. 16th.

AIR FORCE.

DEATHS.

HALL-SMITH.—Lieut. Phil Hall-Smith, R.A.F., who died on Aug. 1st as the result of aeroplane accident at Leuchars Aerodrome, Fife, was 30 years of age.

LUPINSKY.—A verdict of "Accidental Death" was returned at Doncaster on July 28th in an inquest on the body of Lieut. Lupinsky, a Russian flying officer, who was struck by an airscrew and killed on the Doncaster Aerodrome on July 26th, when preparing to return to Tadcaster.

ROBERTS AND IRELAND.—On July 31st, Sec. Lieut. W. A. Roberts, R.A.F., of Shirebrook, Derbyshire, the pilot, and Sec. Lieut. Edward Ireland, R.A.F., of Liverpool, the passenger, were killed at Cranwell Aerodrome, Lincolnshire, while flying a Bristol Fighter (250 h.p. engine, type unknown).

At half-past two o'clock they ascended for a flight to Liverpool, taking off against a slight head wind. When about 200 feet up the pilot banked at a steep angle, and before the machine could recover it side-slipped, crashed to the ground, and burst into flames.

The squad of men who had assisted in preparing the flight immediately went to the assistance of the aviators, but it was found impossible to extricate them. The machine was a complete wreck, and the death of the two occupants must have been instantaneous.

TONKS.—Capt. Adrian James Boswell Tonks, D.F.C. and Bar, R.A.F., who died on July 14th at Raselfin Hospital, Alexandria, from injuries in a flying accident, was the youngest son of Mr. and Mrs. Arthur George Tonks, 31, Addison Mansions, Kensington, W.14.

BIRTH.

BOOTH.—On July 18th, at Heathfield, Shortlands, to Winnie (née Cowen), widow of Sec. Lt. Sydney Edwin Booth, R.A.F., a daughter—Audrey Sydney.

ON THE HARMSWORTH PRESS AND THE R.A.F. VOTE.

Naturally none of us who is concerned with aeronautics sets much store by the opinions of Lord Rothermere, whose operations as our first Air Minister gave all of us a pretty fair measure both of his incapacity as the chief of a Government department and of the curious methods by which he conducts official business. Unfortunately, however, Lord Rothermere either directs or influences a good many newspapers, which by reason of their big circulation carry influence among the bulk of the unintelligent population.

One recalls that caustic remark of the *Morning Post* some years ago, when it referred to the period before the war "when Lord Northcliffe started the *Daily Mail* for people who could not think, and Lord Rothermere started the *Daily Mirror* for people who could not read." The people who cannot think or cannot read hold the majority of votes in this country, and consequently when Lord Northcliffe and/or Lord Rothermere set forth on a campaign—no matter how wrong-headed—there is grave danger of their unintelligent or illiterate followers enabling them by sheer weight of numbers to do great harm to the King's Services.

A Campaign of Misrepresentation.

At present it is believed that Lord Northcliffe is out of the country, therefore it seems fair to attribute to Lord Rothermere the campaign against the present Chiefs of the Royal Air Force which began in the *Times* on Aug. 15th and continued in the *Sunday Pictorial* of Aug. 17th. It would appear that the Harmsworth Press is starting another of its attempts to wreck a man or an institution on whom or on which the public weal depends.

The former paper protested against the sum of £25,000,000 per annum being voted for the R.A.F., and pointed out that this was only £4,000,000 less than the pre-war Army vote. To any moderately intelligent person this would appear as a complete *non sequitur*, in that the R.A.F. after the war bears no relation whatever to the Army before the war—especially in view of the fact that the Harmsworth Press was the most vigorous, at the time when the R.A.F. was being formed, in arguing that the Air Force must be quite independent from the Army and was in fact much more important. Indeed, one might quite easily quote the Harmsworth Press in favour of an argument that the R.A.F. Vote should be bigger than those of the Navy and Army combined.

Furthermore, the *Times* protested against Mr. Churchill's budgeting for his Departments on the assumption that £25,000,000 to-day is only worth what £12,000,000 was worth before the war, and suggested that Government Departments should base their finances on the pre-war value of money. One can scarcely imagine the *Times* of the late Mr. Delane publishing such a futile argument or displaying such lamentable ignorance of history, but it is scarcely worth while arguing with the Harmsworth Press of to-day on any subject requiring education either in history or economics. One may, however, inquire whether the *Times, Mail, Sunday Pictorial, Daily Mirror,* etc., operate on pre-war prices? If so, why do we pay a penny for a ha'penny *Mail* and threepence for a penny *Times*?

Lord Rothermere's Attack.

Lord Rothermere's personal part in the attack began in the *Sunday Pictorial* of Aug. 17th, in an article under his own signature. He stated therein that it was possible to maintain an Air Force of 20,000 men on a vote of £10,000,000 per annum, which would provide 25 squadrons each of 20 aeroplanes of the most modern type, "and there would be plenty of money left to build up a fine auxiliary service, similar to the R.N.V.R., from the many civilian airmen and mechanics."

In that one short paragraph Lord Rothermere exposes his lamentable ignorance of aviation, aircraft, finance, foreign policy, the British Empire, and the English language. One would willingly give a few years of one's life for the privilege of dealing faithfully with Lord Rothermere's statement in those numerous papers which are read by the uneducated majority of the King's subjects. As it is, one can only do so briefly in this paper, where one is preaching to the converted. Still, a few points may be useful to one's readers when they are drawn into argument with the ignorant.

How the Money Goes.

Firstly, 25 squadrons of 20 aeroplanes apiece means 500 aeroplanes. These entail 500 more in reserve. Which means 1,000 aeroplanes. At the moderate price of £5,000 apiece (to include big bombers and flying boats at £20,000 or £30,000 each as well as school machines at £1,500) that means £5,000,000 out of Lord Rothermere's ten millions.

Secondly, 25 active-service squadrons have to serve—both for sea and land, remember—all our Naval and Military stations abroad as well as at home. How would Lord Rothermere distribute 25 squadrons between India, Burmah, Hong-Kong, Mesopotamia, Syria, Egypt, Aden, Malta, Gibraltar, British East Africa, British Central Africa, Somaliland, the Soudan, West Africa, Nigeria, and a few other odd places where British troops are permanently stationed, and where, consequently, there must be detachments of the R.A.F.?

Also when he has distributed his 25 squadrons—apparently at the rate of about two machines per military station abroad—what is he going to do about air stations at home, and about R.A.F. detachments with the Fleet?

Cost of Upkeep.

At a very moderate estimate of post-bellum prices and rates of pay his 20,000 men are going to cost him £300 apiece for pay, and food, and uniforms and lodging, so that is another £6,000,000 out of the ten millions. Thus Lord Rothermere has already spent a million over and above his estimate before he has even begun on such things as administrative expenses, armament, petrol and

oil, transport, travelling, shipping, maintenance of aerodromes, or the pay and allowances of officers.

From this one may form some estimate of Lord Rothermere's capacity for managing any ordinary business, let alone one of the King's Armed Services on which the welfare of the Realm depends. One can only be thankful that his term of office as Air Minister was so short. Heaven knows, his Fleet Street methods did enough harm at the Air Ministry as it was, but only now does one realise how lamentable it would have been if he had remained in office.

That Resignation.

His resignation apparently saved the R.A.F. in the Field from utter disaster. When Lord Rothermere resigned his retirement was ascribed officially to an attack of bronchitis. A cynical official remarked at the time, "Bronchitis is sometimes caused by cold feet and exposure." Certainly no exposure could be so complete as that which Lord Rothermere has made of his own ideals and methods in that one brief paragraph in the *Sunday Pictorial*.

Peace and Retrenchment are excellent companions after a great and expensive war. But Folly and Meanness combined in time of peace—a peace in which over 20 wars are still raging—can only mean the ruin of the British Empire just when it is most necessary to maintain our prestige as a Great Power.

Underlying Motives.

In politics no weapon is too dirty for use, and it seems that all these attacks on the administration and organisation of the R.A.F. are part of the political game. Whether the attack is on Mr. Churchill in his dual capacity as War and Air Minister is not quite clear, but one thing does seem quite clear—namely, that Lord Rothermere is determined to undermine the position of Sir Hugh Trenchard, Chief of the Air Staff.

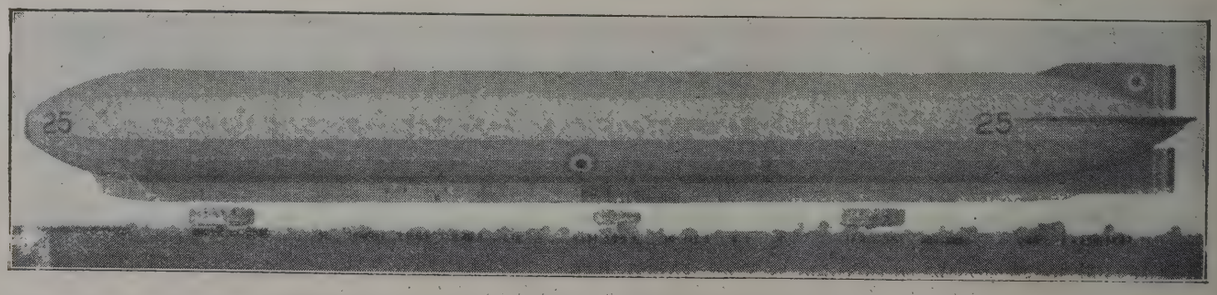
It will be remembered that Lord Rothermere's methods caused the resignation of General Trenchard early in 1918, but that Sir Hugh's public reputation and the esteem in which he was held by the personnel of the R.A.F. was greatly enhanced by the storm raised by his resignation, and that ultimately that same storm forced Lord Rothermere to resign. There seems, then, only too much reason for the popular impression that this present attack on the R.A.F. is influenced by a desire on the part of Lord Rothermere to "get his own back."

Perhaps this impression is unjust to Lord Rothermere, but it is evident that if the Air Force Vote is cut down owing to these attacks to a point at which it is impossible to organise an adequate and efficient nucleus Air Force—for it can be nothing more, even on £25,000,000 per annum—the Chief of the Air Staff and all those officers who are so loyally supporting his efforts must of necessity resign in order to save their reputations and to avoid being associated with what must obviously be a disastrous failure. If they go, the whole R.A.F. will fall to pieces, for nothing but the personal loyalty of the better-class officers to Sir Hugh Trenchard and his Staff is holding the Force together to-day. Then the Navy and the Army will have to start again from the beginning to build up their own air services, and the remains of the R.A.F. will become a mere mockery, and a very real waste of money.

An Unfortunate Connection.

The *Times* attack is accompanied by an unfortunate chain of circumstances which have given rise to another impression which should be removed as soon as possible. One mentions no names, because one has a high regard for the officers concerned, and though they will be recognised at once by those "in the know" it seems unnecessary to give their names to those who are outside.

The *Times* is advised on technical aeronautical matters by a distinguished officer who did much good organising work during the war, and was at one time closely associated with Lord Rothermere. His success in the R.F.C. was largely due to the high quality of the work which he did on the staff of a General Officer who was responsible for a very great share of the victory of the R.F.C., and later of the R.A.F. in the Field. It is somewhat natural, therefore, that those who only know so much should assume that the attack in the *Times* is influenced by a desire to further the interests of that General Officer.



Knowing something of the loyalty of both these officers to the present Chief of the Air Staff in the old days, one personally refuses to believe that either of them would be a party to any attack which would make the task of organising the post-bellum R.A.F. more difficult than it is. But it would be well for both if it were made quite clear that the officer who has turned journalist disagrees entirely with the policy of decreasing the R.A.F. Vote in obedience either to political agitation or to personal influence inspired by individual animosity.

The position is one of very great difficulty, but there are times when a man has to sacrifice material benefits for the sake of his loyalty or of his personal honour. And this appears to be one of them. Otherwise people who are only partly cognisant of the facts are bound to impute to internal intrigue some of the responsibility for these latest attacks.

A Plea for Loyalty.

Those who wish well to the R.A.F. and its great chief can fight political agitators and personal attacks by outsiders (in whatever sense one cares to interpret the word), but a house divided against itself cannot stand. And if the R.A.F. is to exist as a separate Third Service it can only weather the present storm if all within it are loyal to the existing administration.

Personally, one still believes that for purely tactical uses the Navy and the Army should have their own Air Services and their own lines of supply of aircraft. But one realises that a separate Air Force is desirable for purely aerial operations. One believes that if this Empire is to retain its position in the world it must hold the Command of the Air as it held the Command of the Sea. And such Command can only be held by an adequate, an efficient, and a loyal Air Force. Let all those who have their King and Country at heart work together for that end.—C. G. G.

R25—A sister ship of R23, R21 and R26—of the external girder keel type.

ON AIRSHIPS.

Frankly one knows very little about airships. The work of editing this number of THE AEROPLANE has taught one far more about the design, construction, and operation of airships, and about the types of ships now in being, than one knew before. One hopes therefore that the readers of this paper, who are mostly concerned with aeroplanes, will find the contents of this present issue as informative as have the editorial staff. The thanks of the readers and the staff alike are due to the various airship firms which have contributed so much valuable information and so many interesting illustrations for the benefit of the world at large, and one hopes that the resultant publicity will help materially in making better known the claims of the airship on the attention of those who hope to develop aerial transport and travel.

THE ONE DRAWBACK.

There can be no disputing the fact that for long-distance non-stop journeys the airship has great advantages over the aeroplane. Personally one is not enamoured of the idea of hanging below or sitting on top of a mass of highly inflammable gas for several days at a time, especially when that mass of gas is driven by engines of a highly explosive character. Nevertheless the records of airships in the war go to prove that the double risk of fire from the engines and fire from the envelope is much less than might be imagined.

If and when helium gas can be produced on a commercial basis, and the common petrol engine has been superseded either by a heavy-oil Diesel-type engine or by an ammonia turbine, then the airship will be the ideal vehicle in which to travel. Long before the war the Zeppelins proved that an airship can be wrecked either in a forest or on bare rocks without harm to passengers or crew. The only genuine danger in airships is the danger of fire. When once that danger is abolished the airship will be the safest vehicle in the world.

THE TASK OF THE SCIENTIST.

Therefore one advocates most strongly that those eminent scientists who are investigating and experimenting with airships should devote far more attention to these subjects than to the improvement of existing engines or to the production of fabrics which are impermeable to hydrogen. It will be better to abolish the causes of fire than merely to try to prevent its occurrence.

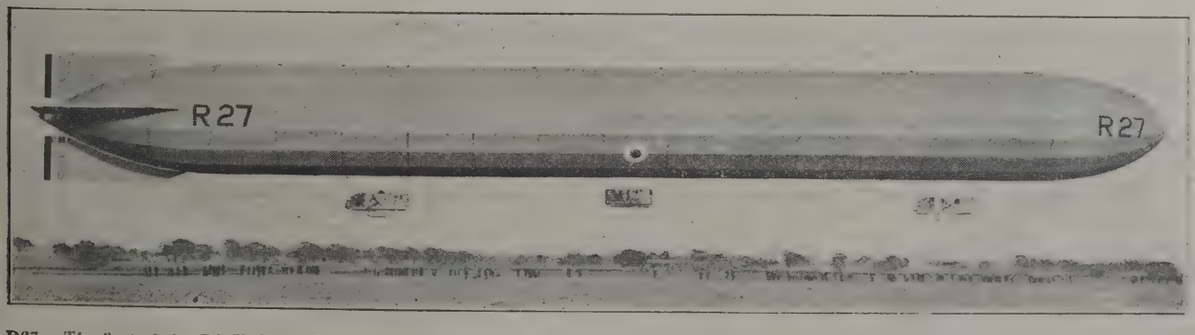
Till that has been done the airship will never be a commercial success. As soon as it has been done there will be no difficulty whatever in finding all the capital needed for the establishment of airship lines all over the world. When the non-inflammable airship has been produced airships will soon become as common as steamships, or even commoner, for they will cover the earth as well as the sea.

BLIMP-YACHTING.

The big airships will naturally be the property of the various States, or of big transport lines, for their cost will be too great for even a millionaire, but the small ships, of the S.S. Class, commonly known as "Blimps," and even the larger ships of the N.S., or the Italian M. Class, may very well appeal to the private owner who in these days keeps a yacht. In fact it is surprising that no well-to-do person has yet acquired a private airship, considering that they can be bought so cheaply from the Disposal Board.

Not long ago an eminent airship officer proposed quite seriously to try and form a "Blimp-yacht Club." His idea was that a number of fairly wealthy men should join together and buy one of the disused R.A.F. airship stations, such for example as Polegate—which is easily reached by road or rail from London. There they would keep a number of small ships and spend their week-ends "yachting" over the South Downs.

The prospect is distinctly alluring, for the small airship can do things which the aeroplane can not. The downland of England or the mountains of Scotland or Wales are about as interesting as the Fen Country when seen from a height at which it is safe for an aeroplane to fly over them. The airship, on the other hand, can paddle about just over the tree-tops, or along the middle of valleys, so that views can be seen from it which are unobtainable in any other way.



Even if an aeroplane pilot foolishly takes the risk of flying so low he must tear along at 60 miles an hour or more, whereas an airship can remain stationary over one point if so desired. Consequently as a pure pleasure vehicle the small airship combines all the pleasures of yachting and motoring without the discomforts of either.

As in the case of the big ships the only danger is fire. This danger must be overcome before Blimp-yachting can become popular, but even as things are, there is no doubt that a Blimp-yacht Club might be made a genuine success if taken in hand by energetic people.

In fact one believes that if a well-run business firm took the matter in hand and bought a number of disused Blimps, it could make a commercial success of a kind of combined Blimp-yacht Club and a "joy-ride" concern. Many thousands of those who have tried aeroplane joy-riding as a sport would try Blimp-yachting as a novel experience, and would find that actually it is a more pleasurable form of amusement than aeroplane flying, though obviously very inferior as a means of quick communication.

A CLEAR FUTURE.

Admittedly airships are still in their infancy, though certainly a 600 ft. infant which travels to America and back is a fairly healthy affair. There are many developments to take place before we travel by airship in the same casual way as we travel by sea-ship. But those developments are plainly to be seen ahead, so the future of the airship does not depend on unknown factors, but simply on the energy, enterprise, and faith in aeronautics of those who are to-day responsible for airship development.—C. G. G.

R27.—The first of the R23X Class, British rigid ships without extenal keel. The centre car has been replaced by "wing" cars containing one engine apiece.

THE GOVERNMENT AEROPLANE COMPETITION.

The announcement made by Major-General J. E. B. Seely, C.B., C.M.G., D.S.O., Under-Secretary of State for Air, that the Department of Civil Aviation proposes to offer prizes to the aggregate amount of £64,000 for aeroplanes suitable for commercial purposes, with a special eye to the development of safe and comfortable machines, will naturally arouse some interest. Unfortunately no details of the proposed competition are vouchsafed, and it is impossible to judge of the results likely to be produced.

£64,000 is a useful little sum. Wisely expended in the form of rewards for good work, it may produce a very appreciable effect on the development of commercial aviation in this country; but by itself it will not keep the British aircraft manufacturers going for long. At best it can only be an encouragement.

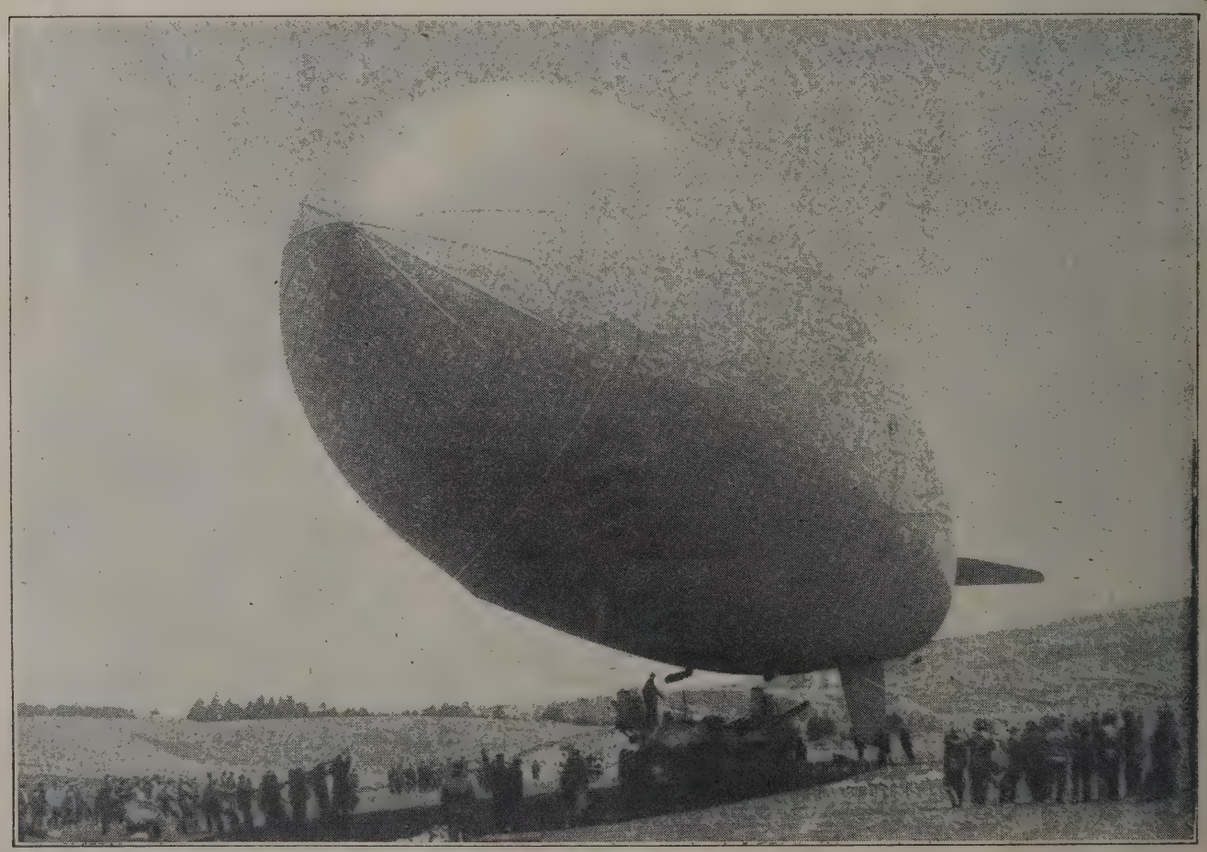
Many of the readers of THE AEROPLANE will remember the Military Aeroplane Trials of 1912, upon which both British and foreign aircraft constructors spent much time, money, and trouble in the belief that a good showing there would secure substantial orders from the British Government.

In the result the late Mr. S. F. Cody reaped a well-merited, if inadequate, reward for his patience and perseverance, and the remaining competitors were the worse by approximately the cost of competing.

If the Department of Civil Aeronautics is to follow in the footsteps of its military predecessor of 1912, and if British aircraft manufacturers are to be treated in the same shabby way as they then were, one can expect no good to come of the competition.

If, on the other hand, the conditions are so drawn up as adequately to encourage the development of types of aircraft which shall really be valuable for commercial purposes, and if there is really an undertaking that the Department of Civil Aviation will take proper steps to assist competitors in securing some real reward in the shape of orders, the competition deserves every support.

It does not seem probable that the Air Ministry can itself give orders for commercial aircraft, but it may influence other people. It is surely not possible that Major-General Seely has succeeded in awakening the Postmaster-General, but he may do so by sufficient assiduity.



ANOTHER HONOUR.

All will rejoice at the further honour conferred on the Royal Air Force by the promotion of Sir Hugh Trenchard, Bart., K.C.B., D.S.O., to the rank of Air-Marshal. This promotion gives Sir Hugh equivalent rank to a Lieut.-General in the Army, and raises the R.A.F. to the dignity of an Army Corps of the Army.

The only fly in the ointment is the fear lest the present ill-advised campaign for economy—which appears to be degenerating into a war of personal interests—should leave the Air-Marshal without an Air Force to marshal, for if the Air Force Vote is to be reduced below £25,000,000 the Air Force is likely to become an organisation like unto the armies of Central American States, consisting of many Generals and a few sentries.

THE ABANDONMENT OF AIRSHIPS.

It is alleged that the whole airship construction programme is to be abandoned and that the existing airship stations and airships will carry on as best they can with "nucleus crews." This would be quite in accord with the best Lloyd-Georgian methods. As there is not likely to be any demand for airships in war during the lifetime of most members of the present Government, abolish airships and let posterity build its own. As a famous politician of the past is reported to have said:—"Damn posterity! What has posterity done for us?"

AIRSHIPS IN THE WAR—AND THE FUTURE.

By PETER GEOFFREYS.

Before the war it was not unusual to regard the airship as something in the nature of an extravagantly impracticable mammoth, possessing a large and costly appetite, a delicate constitution and negligible utility. It was also thought that the airship, like the mammoth would meet an early termination of its existence as the inevitable consequence of misevolution. Nevertheless the airship is still with us.

THE NAVAL ASPECT.

In the naval side of the war to which the activities of airships have been generally confined, the results produced by airships in their proper sphere, have not only justified their existence, but have earned for them an established place in naval strategy, with possibilities for future development wider and very much more easily realisable than those in prospect for heavier-than-air machines.

Unhappily, during the war, the enemy enjoyed the advantage of preponderating strength in rigid airships capable of extended action with a fleet at sea, and hostilities ended just too soon to allow British effort to take effect.

For three years Germany was able to maintain almost unhindered aerial reconnaissance with Zeppelins over the North Sea, excluding coastal patrols. Lord Jellicoe in his book has indicated the extent to which this advantage might have assisted a more offensively inclined enemy.

In certain circumstances, Lord Jellicoe pointed out, a rigid airship may have the value of two cruisers. This comparison, one might add, refers to the highly developed modern cruiser in relation to the present type of rigid airship, which has scarcely passed from its teething stage.

IN THE ATLANTIC?

Naval warfare of the future, it may reasonably be supposed, will be subject to modification. The capital ship must always be a decisive factor, but it is probably correct to prophesy that the duties of the smaller fry of seacraft will be increasingly usurped by aircraft; primarily by rigid airships by virtue of their superior air endurance.

The rate of development, as regards airships, may be partially dependent upon a rather indeterminable factor—non-inflammable gas. According to official announcements in the United States, helium gas is already being produced in fairly large quantities in Texas. Whether supplies will be available for British airships, and whether other sources for its production, as yet unknown, may be discovered are questions for the future. Newspaper reports suggest that helium has been recently found in Canada.

The future of non-rigid airships in war is less easy to predict. The non-rigid type appears to have little value for any other naval or military purposes than submarine hunting, in military operations against semi-civilised tribes and to a limited extent for training the personnel of rigids. As it is possible that submarine warfare may in future be banned by the League of Nations, the most important of these functions may cease to exist. In any case, non-rigids can be built by one country as fast as another can turn out submarines. Possibly the development of a satisfactory system of towing non-rigids from seacraft might create a new and important function for small airships.

In peacetime, Service non-rigid airships may, it is proposed, be employed in connection with colonial photographic surveys, for which purpose they are very well suited. The field for activity in this direction is enormous. India alone among the Dominions and Crown Colonies has as yet received exact topographical survey, and incidentally, of the whole land surface of the world only about one-sixth has been exactly surveyed.

BRITISH NON-RIGID DEVELOPMENT.

British progress in airship design has proceeded in two parallel lines, allied but virtually independent, in the development of the non-rigid and rigid types.

To those associated with the non-rigid school the more credit is due, for as a result of their work, conducted without contemporary assistance or influence, the British non-rigid is the finest for its size in the world, superior in many respects to the Italian semi-rigid vessels of considerably longer pedigree.

It has often been said, apropos of locomotive design, that when an English engineer sets out to improve his engine he contrives to take something off it, whereas the Frenchman devises something new to put on. The same principle has applied to airship design. Simplicity is the chief characteristic of the British types, while refined complexity marks the majority of Continental models.

The requirements of the anti-submarine patrol have demanded from our airships high speed, reliability and endurance, with which is included comfort for the crew; height has been an unimportant factor. There are the qualities which distinguish British non-rigids and generally speaking will respond to the needs of commercial air transport.

As the Admiralty has announced its intention of selling a number of non-rigid airships, one presumes that it is permissible to mention that during the war a new and highly satisfactory method has been developed for protecting the outer surface of non-rigid airship envelopes.

This process is applied in conjunction with the rubber proofing, and consists of depositing a mixture of rubber and aluminium powder on to the fabric in a thin layer, by means of a form of rotary printing machine. Most of the non-rigid envelopes are made of this aluminium-faced fabric, which, whilst combining the good qualities of impermeability and durability, requires no dope.

IMPORTED LUXURIES.

Whilst it is true that the lead of twelve years which Germany had gained with rigid airships has to-day been reduced to two, this achievement cannot be attributed to originality on the part of our rigid airship designers.

Extraordinary progress has nevertheless been made in constructional technique and in minor detail design, despite the limitations

Having closed our business we have the following

AIRCRAFT FOR DISPOSAL.

1919 MODELS.

1 50 H.P. GNOME L. & P. 2-SEATER DUAL CONTROL FUSELAGE BIPLANE, in new condition, complete with spare engine (just overhauled and tested) and propellor.

PRICE £285

1 Similar Lot.

1 50 H.P. GNOME L. & P. 2-SEATER DUAL CONTROL FUSELAGE BIPLANE, just been completely overhauled and re-covered, complete with spare engine (just overhauled and tested) and propellor. PRICE £275

These machines have a factor of safety of 8, and are of the best construction throughout. All have been looped and spun on their tests. Speed on level 60-65 m.p.h. Landing speed 32 m.p.h. On a solo height test one of these machines reached a height of 9,000 feet in 45 minutes.

SPARES.

In case of spares being required for these aeroplanes or engines we have a large quantity in stock which can be obtained at reasonable prices.

We also have a number of CAUDRON type training machines in good condition for sale.

imposed by war conditions, and it is probable, therefore, that R33 and R34, launched since the Armistice, are superior to their prototype, the L33 brought down at Little Wigborough.

The previous British efforts, R9, R23, R23X and R31 classes, were not remarkable for any particular virtues. On the other hand, only one instance is to be recorded of an utter failure, and that was the result of defective material and the lack of time available for preliminary tests, rather than faulty conception. The plywood airship, R31, is that to which one refers.

Even though the early rigid airships failed to fulfil many hopeful expectations, they satisfactorily served the purpose for which they were rightly intended—that of training the multi-graded personnel in readiness for airships capable of Fleet work.

Altogether eleven rigid airships had been completed or were nearing completion at the close of the war. At the time of writing, May, 1919, it is freely reported that a new class of rigid airship has been laid down which will have a volume approaching 3,000,000 cubic ft. of gas. From comparative data, such an airship might be presumed to develop a speed of about 70 miles an hour, with an endurance of upwards of 8 days. With the German constructors reduced to a state of impotency, this new airship will be the largest existent.

War Records.

Figures relating to the work of the Airship Service have already appeared in the Press, and one's excuse for repeating them here is that they may be readily available for reference.

A sum total of 2,245,800 miles has been flown on service during the war, representing an air endurance of 87,700 hours; the bulk of this flying has been carried out over the sea, with a total loss of life from all causes of 16 officers and 32 men.

At the beginning of the war, seven airships, two only of which could be regarded as effective, were in commission. One airship station was in working order and another in an unfinished condition, excluding a few privately-owned sheds. The airship constructing industry in this country was to all intents and purposes non-existent.

On October 31st, 1918, 103 airships of all types were in operation, a chain of airship base stations and mooring-out stations had been created around the coasts of England and part of Scotland, and an almost continuous patrol was maintained over the War Channels from the Scillies to Scapa Flow. The British airship industry was in 1919 the most powerful of its kind in the world. Whether it remains so is a matter for Parliament and the Treasury to decide.

Allied Activity.

Italy.—Considering first the work of Italy, as befits the most insistent of our allies, it is interesting to observe that in Europe the Italians stand alone in maintaining a military airship service. Moreover, the Italian airship represents a striking power of considerable value against a neighbour ill-equipped with heavier-than-air machines. In addition to the military airships, a certain number of vessels are operated by the Italian Navy.

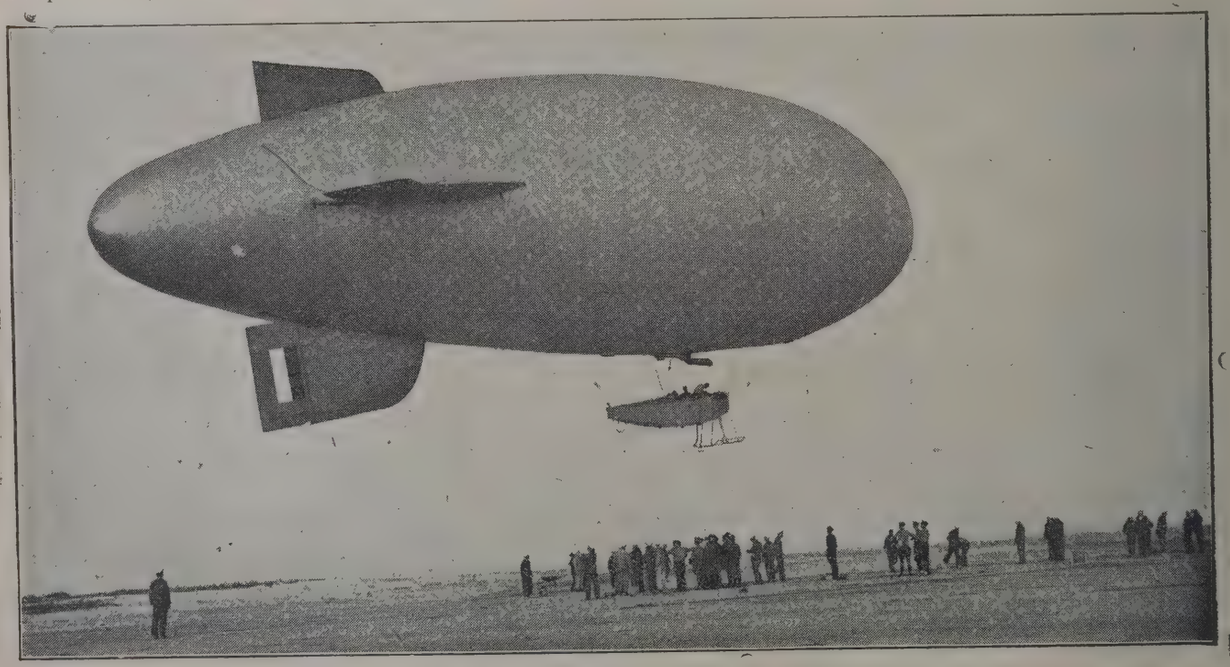
During the war numerous raids were carried out by Italian airships on Pola, Trieste, St. Marco Docks, and various points of importance behind the Austrian lines. Further, it is reported that the bombing operations of the airships during the big Italian retreat in 1917 contributed materially to the success of the withdrawal.

In design the Italians have adhered to the semi-rigid system, which has been brought to a high pitch of perfection in the M type.

The conditions underlying design in Italy are fundamentally different to those in this country. Height has been the primary object in view, owing to the necessity for evading hostile gunfire. Endurance has been a secondary consideration, because the raiding flights performed were seldom or never of long duration. That speed has been neglected is evident from the bulky unfaired cars and the multiplicity and length of rigging cables of most Italian craft. In Italy the winds are considerably less in average force than in Britain, and therefore a relatively high rate of speed has not been essential.

The Italian designers have sacrified all other qualities in order to increase the maximum ceiling of their vessels, and in this object they have been enormously assisted by the superabundance of skilled labour at their disposal, which has permitted extreme structural lightness to be obtained and, incidentally, truly Latin excellence of craftsmanship.

Contrary to popular belief, the Forlanini and Usuelli types have not been very extensively employed, although the Forlanini, at least, has well kept pace with contemporary progress.

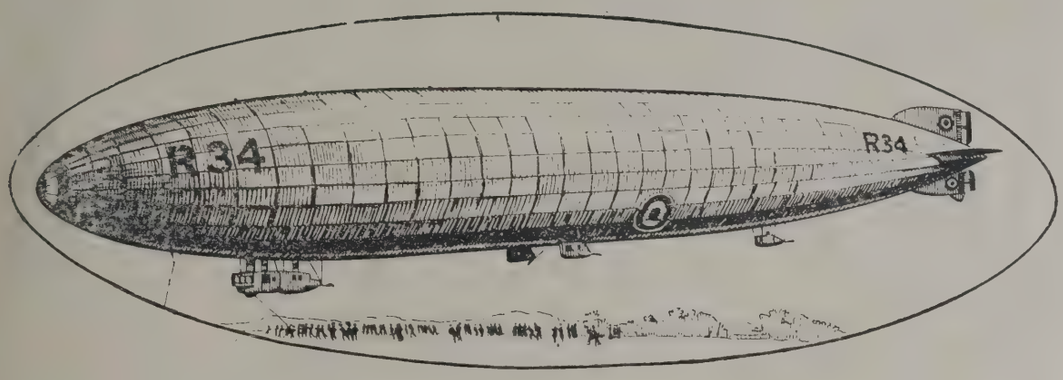


France.—French interest in the airship appears to have languished since the war proved the vulnerability of lighter-than-air craft in modern conditions of warfare on land against a well-armed enemy.

A useful type of non-rigid airship has been evolved with which to operate against enemy submarines around French ports, but the necessity for energetic measures has been less urgent, and comparably the progress of development has been less rapid than in this country.

United States.—The Americans can be congratulated on acquiring, amongst other valuable information imported into the United States during the past two years, the knowledge which has enabled them to produce helium and has given them the means of applying it with the best effect in practice.

It is presumably permissible to mention that numerous Americans have undergone training at Airship Stations in this country and in France, returning to the United States with complete information as to the manner in which years of experience direct that airship services should be conducted. Moreover, both British and French airships have been purchased and conveyed to America, where designers have had the opportunity of gleaning the latest ideas from Old World construction.



The American building programme, as disclosed to the Senate with the introduction of the Naval Estimates on Nov. 28th last year, provided for the construction of three large rigid airships, in addition to a host of non-rigid vessels. Possibly this scheme has since been modified, but there is reason to believe that America, in pursuance of her Naval policy, and enjoying at present an important advantage as the sole producer of helium

AN AMERICAN NON-RIGID.—A "B" Class Airship fitted with cruciform fins.

"R.34"

THE FIRST AIRSHIP TO CROSS THE ATLANTIC MAKING THE ROUND TRIP INSIDE 11 DAYS.

gas, will make a strong bid for supremacy with airships, both in peace and war.

THE SPIRITUAL HOME OF THE RIGID.

It is scarcely necessary to recount the work of the German airships in the war, beyond emphasising the importance of their activities as sea scouts. The development of the Zeppelin, however, is an interesting and little known subject.

Strange as it may seem when comparing the performance of the pre-war types with that of the latest airship of the L70 class, Zeppelin development has made apparently not more than four distinct advances since 1914, and only two of these have been accompanied by a material change in dimensions.

In 1916, the serial numbers of the "L" airships broke off abruptly at L24. This was not, as might have been supposed, an indication that the Germans intended to cease construction, for before long appeared the first vessel of a new and enlarged type with a capacity of two million cubic ft. This airship had a considerably improved form (closely similar in silhouette to the Schütte-Lanz) and six 240 h.p. Maybach engines, producing a maximum speed of 60-62 m.p.h.

Following upon this achievement, the German designers proceeded diligently to elevate and to improve the new model. Elevation was the principal object in order to enable the ships to rise above the range of anti-aircraft gunfire. As a result, the next type, commencing at the beginning of 1917 with L40, came to be known as the "height-climbing" class—this is the type illustrated in the photograph elsewhere.

Broadly speaking, the dimensions, capacity and general arrangement of L40 were identical with those of L30. The hull structure was considerably lightened, smaller fish-form gondolas were fitted, and five engines were installed instead of the six in L30, involving the deletion of the "wing" propellers driven from the after car. These modifications not only raised the ceiling of the class to about 20,000 ft., but actually resulted in an increase in speed.

Next, towards the end of 1917, came the "long range" class of Zeppelin, probably beginning with L57. It may be remembered that L57 was the airship with which an attempt was made to fly from Transylvania to East Africa with medical stores. The "long range" class was slightly larger than its predecessors, containing approximately 2,200,000 cubic ft. of gas when full. Probably five 500 h.p. Maybach engines were installed.

Retiring once more to refine the new breed, the Zeppelin designers delivered the highly efficient L70, a ship more or less of the same tonnage as the L57, but equipped with seven 300 h.p. Maybach engines. This airship was reported to be capable of a full speed of more than 77 miles per hour and of a static rise to 21,000 ft.

From the beginning, the system of development has been thoroughly characteristic of the Teutonic mind. Each advance has been the result of laborious experiment. In fact, it may be said that each airship produced has been experimental.

This principle of step by step progression has been particularly noticeable in the design of the hull structure. Airships belonging to each separate class and built to the same general specification have rarely been identical in detail composition. Generally, the aim has been to lighten each successive ship to the uttermost degree, until indeed a point has been reached where a breakage in the air has necessitated restrengthening, and weight has again had to be added. As a means of rapidly attaining maximum practical efficiency, irrespective of other considerations, the system has much to commend it.

AIRSHIPS IN COMMERCE.

In the light of present knowledge, the question of the employment of aircraft in commercial or postal undertakings, as distinct from advertisement and ornamental displays and pleasure flying, is an uncertain one.

After the first rather hysterical manifestation of enthusiasm for air transport, there has appeared a realisation of the many difficulties which must be faced in developing commercial aeronautics.

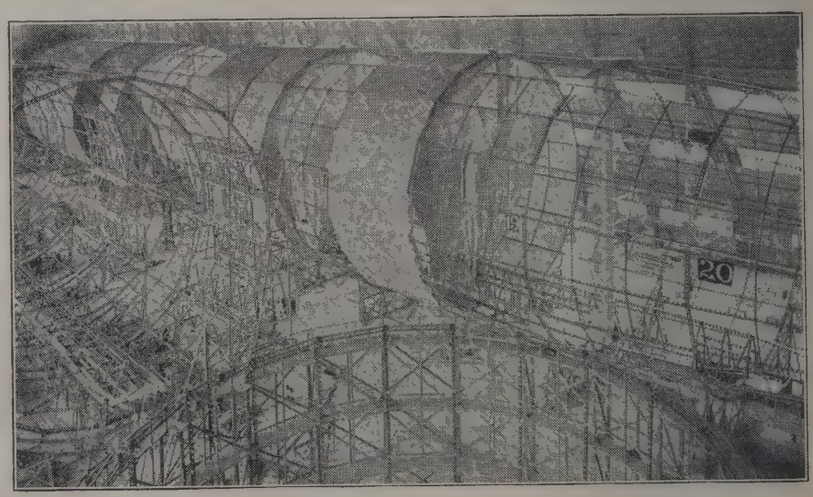
So far as aeroplanes are concerned, it is generally considered that long distance communication over land constitutes the most fruitful field for activity, but even so it appears that the time is not yet ripe for extensive development. The use of seaplanes and flying-boats for overwater traffic is equally dependent upon advances being made, although less affected by competition from existing methods of transport than is the case with aeroplanes operating over land.

The position was summed up in a lecture, in May of this year, to the Liverpool Chamber of Commerce by Major-General Sir Fredk. Sykes, Controller-General of Civil Aviation, when he said, "There seems to be what I can only describe as a gap in front of us. We can mentally pick up the probable future curve of progress some little way ahead. But there is some very important missing link somewhere."

Turning to airships, General Sykes continued, "It is possible that the airship may help us to advance in many directions whilst the 'gap' is being bridged. At all events, both the heavier- and lighter-than-air types of aircraft have their appropriate places in aviation."

For long-distance flying over wide expanses of sea or land unsuitable for aeroplane traffic, the airship has many definite advantages, and this is certainly its appropriate function. Moreover, there are many arguments in favour of employing airships for journeys such as, for example, London to India and Australia, which are frequently considered to be the prerogatives of aeroplanes.

The large rigid airship, capable of flights of 2,000-3,000 miles carrying a commercial load, could lay a direct course, avoiding high mountains, of course, to any destination, without regard to the suitability of the intervening terrain for landing and refuelling purposes. India could be reached with one stop at Cairo. A prolongation of the flight, via Singapore, would take the vessel to Australia in one nearly straight line throughout the journey. Compare this with the suggested aeroplane route to the East, which involves the formation of scores of repair and re-fuelling depots, intermediate landing grounds and emergency alighting grounds in all sorts of inaccessible places, constituting the links of a deviously winding chain across three continents.



Considering the question of speed, the fastest type of aeroplane at all likely to be useful for load carrying would attain a maximum speed of 125 m.p.h. The Handley-Page machines are limited to approximately 95 m.p.h. It is customary service practice when estimating average ground speed to deduct at least 25 p.c. from the maximum air speed of a machine on account of adverse winds. Also, fully 10 p.c. can further be deducted for the time lost at stopping places. This allows a halt of 30 min. every 400 miles—certainly a reasonable amount. Therefore, 80 m.p.h. is probably the maximum speed now attainable with aeroplane transport.

On the other hand, the commercial airship would be designed to have a full speed of 80 m.p.h. and a cruising speed of 60 m.p.h. at half power. Her course would be direct, and in the aggregate the time for a long journey would not be so very much greater.

It would be ridiculous to pretend that the airship can never be so fast as the aeroplane, but the loads carried in comparison with the unit cost of machine, unit cost of man power engaged and unit cost of horse-power used, would be less, and this factor has a most important bearing on the question. It should be noted that the assumed costs referred to above are dependent upon the provision and use of a practical scheme of mooring rigid airships in the open; a certain development in the near future.

In connection with General Sykes' views as to the probable lines of future progress, it is important to remember certain basic laws which govern the development of airships and aeroplanes, and will exert an ever-growing influence on their future relations.

With airships we are on the threshold of great advances

SHORT BROS.' WORKS AT BEDFORD.—Showing R31 in the background, and the Frame of R32 in the foreground

CONTRACTORS TO THE ADMIRALTY AND AIR MINISTRY.

Short Brothers

(ROCHESTER & BEDFORD, LTD.)

are the oldest Aeroplane and Seaplane Manufacturers in the British Isles, and are the designers of the Short Folding-Wing Device (patent) for Aeroplanes and Seaplanes.

MORE Short Seaplanes were built and used during the war than the total number of all other British Seaplanes.

OUR Commercial types, embodying minimum expense and maximum durability and safety, are shortly being placed on the market.

R32 is the latest product of our Airship works. Our experience of Airship construction goes back to 1909, when we successfully designed and built the Gasbags, Outer Cover and Valves for the "Mayfly." We will design and build to any requirements.

WORKS:
ROCHESTER, KENT.
Telephone: Chatham 627.

LONDON OFFICE:
WHITEHALL HOUSE, CHARING CROSS.
Telephone: Regent 378.

Every increase in the size of rigid airships is accompanied by a very much greater proportionate increase in efficiency. Although a rigid airship of ten million cubic ft. capacity would have five times the gross lift and more than five times the useful lift of the present two million cubic ft. vessel, the dimensions of the larger airship would be only 70 p.c. greater, and the horse-power required to obtain the same speed only about three times greater. Accordingly, its prime cost would be less in proportion to unit lift, and its running costs would be less still in proportion to its load-carrying ability, or with the same running costs its speed would be greater as compared with the smaller airship of to-day. With aeroplanes, design upon present lines is nearing what appears to be a limit, and increase in size results in no automatic increase in efficiency. The proportion of horse-power required is nearly constant for all sizes, and structurally the weight of the aeroplane tends to become proportionately greater with increased dimensions, incurring a reduction of efficiency.

What is perhaps of greater interest in regard to commercial aeronautics is the fact that the airship will always retain the characteristic of safety, derived from its independence of engine power for support in the air, whereas the heavier-than-air flying machine will always be subject to risk from engine breakdown. Stress is often laid upon the risk of fire present in airships. One can only repeat the official statement that during the whole period of the war, in the course of some two and a half million miles of flying, only one airship was destroyed by the accidental outbreak of fire in the air. This was on the occasion of the trial trip of an experimental vessel, and the responsible cause was ascertained and eliminated.

Airship Mooring.

In view of the fact that the solution of the problem of mooring airships safely in the open will have more importance than any other development in increasing the utility of airships, the accompanying photograph is particularly interesting.

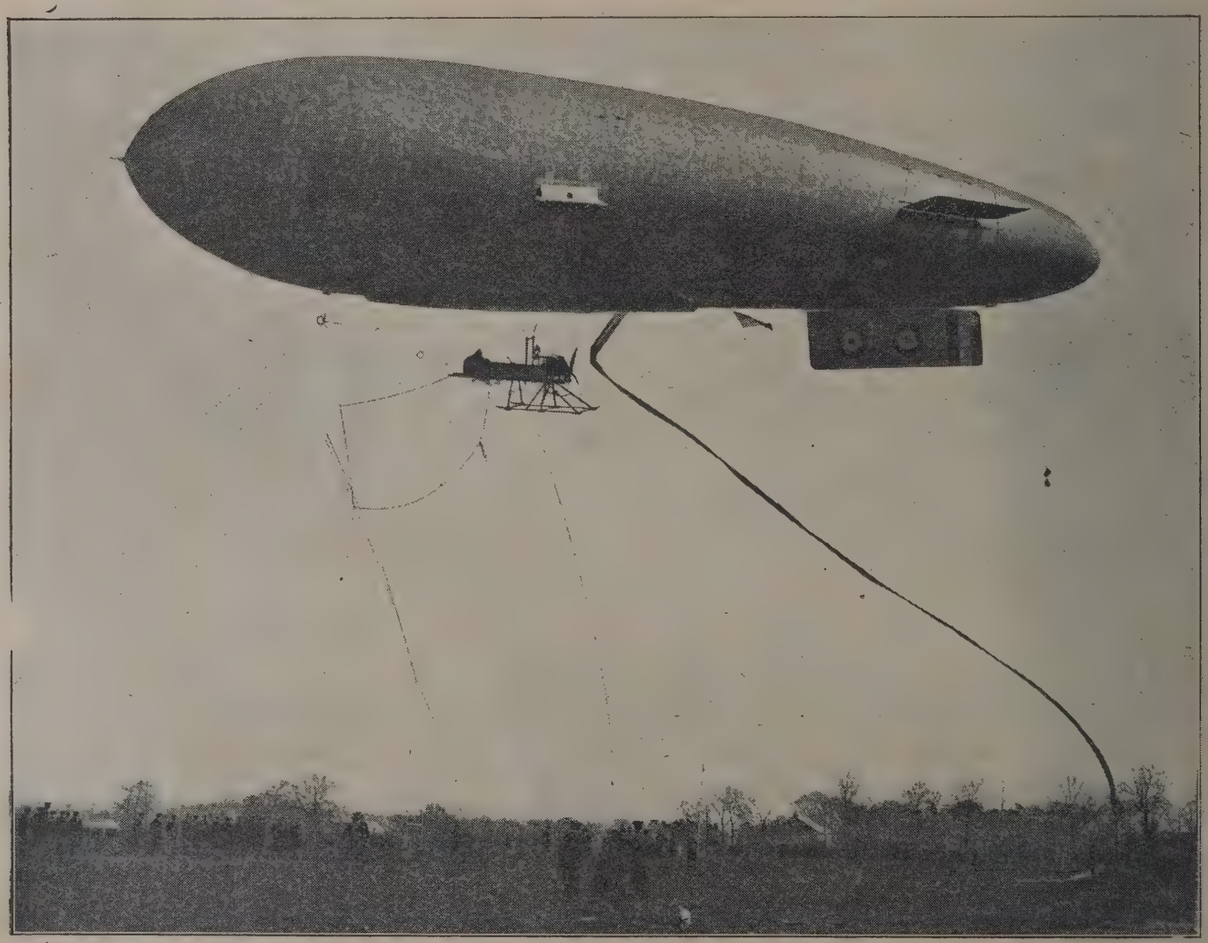
It depicts a small non-rigid airship anchored experimentally above the ground, by means of a "three-wire" mooring gear, during a period of severe weather in which the wind force reached 52 miles per hour. Attached to the wind scoop and trailing leeward is a fabric hose used for conveying air to the ballonets from an air blower on the ground, to maintain envelope pressure.

In the course of another experiment, made with a mooring mast instead of cables, a similar airship was exposed for an unbroken period of six weeks, during this time riding safely at her moorings through all weathers.

Experiments with small non-rigid airships, however, no matter what measure of success may be achieved, cannot in themselves be regarded as evidence that the same methods of mooring will be equally effective when applied to large rigid airships such as would be required for long-distance commercial flying.

The difficulties experienced in mooring rigid airships are more complicated. Not least among them is that of maintaining without large changes the buoyancy of the moored vessel, and with this is involved the problem of counteracting the effects of rapid rises in gas temperature due to the sun.

That the mooring of rigid airships is mechanically practicable was demonstrated so long ago as 1911 with the British rigid airship No. 1 ("Mayfly"), which was moored to a mast for many hours in Cavendish Dock, Barrow, and withstood, without mishap, winds attaining speeds of 36-45 miles per hour. Subsequent events proved the airship to be structurally weak, so emphasising, if emphasis is required, the soundness of the scheme employed for mooring.



SALE OF AIRSHIPS.

Negotiations are not yet completed regarding the purchase of the complete non-rigid airships which the Admiralty offered for sale up to Aug. 12th.

AERODROMES FOR SALE.

The Disposal Board of the Ministry of Munitions at Charing Cross Buildings has several aerodromes in various parts of the country for sale. These include a seaplane station in the Shetland Isles which covers 12½ acres, and the Gullane aerodrome in Haddingtonshire, the area of which is 318 acres.

Information can be obtained from the Disposal Board at the address mentioned above.

AIRSHIP MOORING.—A small non-rigid airship anchored experimentally by means of a three-wire mooring gear.

The First Airship to cross the Atlantic—The Naval Airship R.34—was equipped with Sunbeam-Coatalen engines fitted with

AIRSHIPS OF THE WORLD.

I.—BRITISH NON-RIGID AIRSHIPS.

A British Airship of the S.S. Zero Class. Note the petrol tank and parachute case on the side of the envelope.

Owing to the recent war and the continued existence of the Defence of the Realm Act and the Official Secrets Act, it is impossible to give full details concerning all types of airships in use.

The accompanying illustrations and particulars give a general idea of modern British airships, all of which have been from time to time exhibited to the populace of London and of other large towns, so it is unlikely that any undesirable person will derive from the illustrations any information which should not be known.

The details given concerning each airship are only such as can be published without doing a disservice to the King's Armed Forces.

THE S.S. P. CLASS.

An airship of small size, now used for training purposes, representing an intermediate stage of development between the original Blimp type S.S. and the more refined Zero type.

The nacelle is reminiscent of that of a pusher aeroplane, but considerably larger. The air pipe from the air ballonets is arranged to collect the slipstream from the airscrew, which is mounted at the rear of the nacelle, behind the engine. The landing skid underneath the nacelle is noteworthy.

Control is effected by a rudder and two elevators placed behind the stabilising fins.

Petrol is carried in cylindrical tanks, suspended in fabric slings, one on either side of the envelope.

THE S.S. "ZERO" CLASS.

The S.S. "Zero" followed the S.S., S.S.—M.F., and S.S.P in the genealogical sequence of the Submarine Scout class of non-rigid airships. The type was standardised for production and considerable numbers were built and put in commission during 1917 and 1918 for patrol duties.

The envelope is made of two-ply rubber-proofed fabric. The suspensory cables of the car are attached with stuck-on "Eta" patches, so called because they were first used on the military airship "Eta" in 1913.

To maintain pressure in the envelope and compensate for loss of gas volume, air is blown into two internal ballonets. When full, the ballonets contain a volume of air equivalent to about one-third of the total capacity of the envelope, which in normal conditions is sufficient to permit of a rise to about 8,000 ft. A sloping air scoop interposed in the propeller slip stream keeps the ballonets inflated at the required pressure.

Directional control is effected by a rudder placed behind the vertical fin and by a pair of elevators placed behind the horizontal fins.

A strongly-built boat-shaped car, having an engine mounted upon a gantry at the after end, is the chief distinguishing feature of the S.S. "Zero" airship. Foremost in the car is the compartment for the W./T. operator. Next is the pilot's cockpit. A wheel bearing on a transverse bar actuates the elevators and foot steering pedals operate the rudder. Within easy reach of the pilot's hand are the controls for the gas and air valves, controls for the "crabpot" valves in the air ducts and the tricing line with which the airscoop is raised out of the propeller slip stream. Arranged in front of the pilot are the necessary aerostatic and navigational instruments.

Behind the pilot's seat is a separate compartment for the engineer. A starting handle for the engine with chain and sprocket gear is so adapted that it may be utilised to rotate a hand blower for maintaining pressure in the envelope in the event of engine defect and consequent failure of the air supply from the propeller slip stream.

The S.S. "Zero" is normally capable of a flight of 12 hours' duration at full speed, and 24 hours at half-power (three-quarter speed). Two flights were made during the War of over 50 hours' duration with full war equipment.

CHARACTERISTICS.

Capacity	70,000 cu. ft.
Length	143 ft.
Width (overall)	32 ft.
Height (overall)	46 ft.
Engine	Rolls-Royce "Hawk," 75-h.p.
Gross lift	2.2 tons
Disposable lift	0.33 tons
Full speed	42 kts. (48.37 m.p.h.)
Cruising speed	30 kts. (34.5 m.p.h.)
Crew	3
Cost (war price)	£5,000

THE S.S. "TWIN" CLASS.

An airship produced during 1918, incorporating improvements suggested by experience with the S.S. "Zero" type.

No attempt has been made to depart from the simple characteristic principles of the preceding S.S. airships, either as regards th eenvelope design, "Eta" patch suspension, or air pressure system. In the "Twin," however, the ballonets are duplicated and dual air ducts and scoops are fitted—a feature by which it may be readily recognised.

The car contains accommodation for a crew of five, and two engines are installed in outrigger bearers on either side.

The S.S. "Twin" has a full speed of 50 kts. (57.5 m.p.h.) with petrol capacity for 12 hours at this speed. At the cruising speed of 37 kts. (42.5 m.p.h.), the endurance is estimated to be 30 hours.

CHARACTERISTICS.

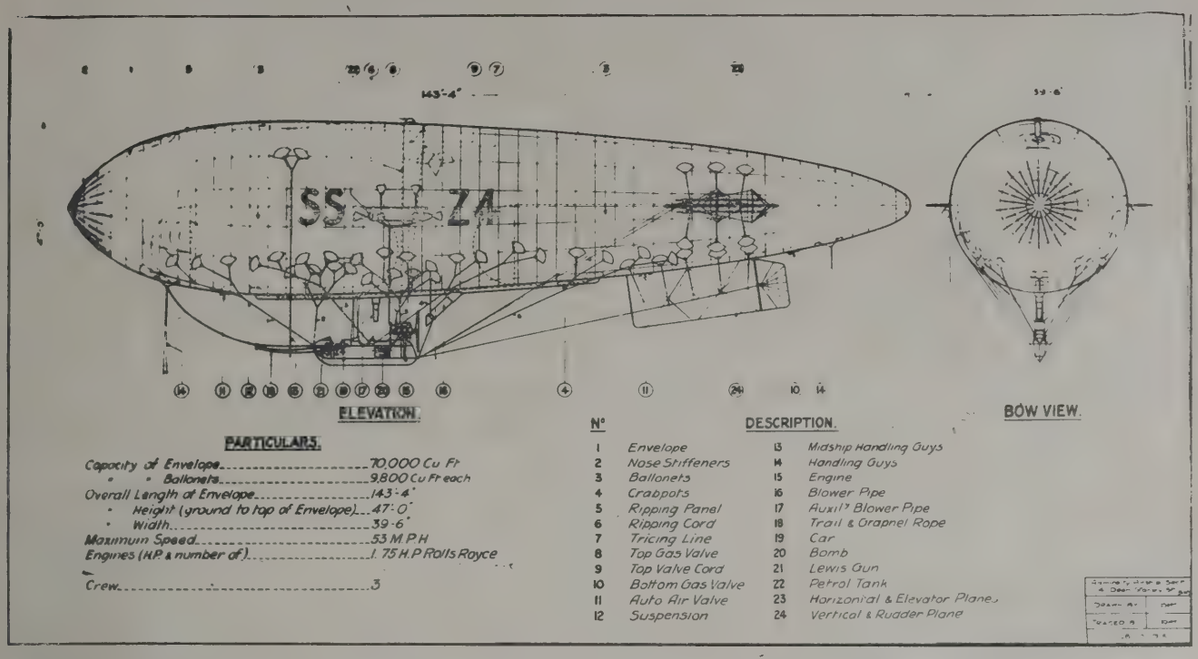
Capacity	100,000 cu. ft.
Length	165 ft.
Width	35 ft. 6 in.
Height	49 ft.
Engines	Two, 75 h.p. Rolls-Royce "Hawk."
Gross lift	3.12 tons.
Disposable lift	1.00 ton.
Full speed	50 kts. (57.5 m.p.h.).
Cruising speed	37 kts. (42.6 m.p.h.).
Crew	4
Cost (war price)	£8,200

"COASTAL" CLASS.

A medium-sized airship of the Astra-Torres type, with an envelope of trefoil section. The suspensory rigging is attached along the lines of intersection of the top and side lobes and passes through the bottom of the envelope to the car.

The air bollonets are inflated by the propeller slipstream through the large metal pipe to the rear of the car. In addition, an auxiliary power-driven air blower is installed in the car.

The vessel is driven by two large four-bladed airscrews driven by independent engines, which are placed respectively at the bow and at the stern of the car.



The controls are the ordinary arrangement of fins, rudder, and elevators. A machine-gun platform is placed on top of the envelope.

An Airship of the S.S. Twin Class landing. Later models are equipped with a circular section car of ply-wood construction.

View looking aft above the navigating car of an N.S. Class airship, showing the arrangement of the two 260 h.p. Fiat engines and interposed Engineers' cabin.

General arrangement diagram of the British S.S. "Zero" class of airship, showing clearly the arrangement of the rigging.

CHARACTERISTICS.

Capacity	170,000 cu. ft.
Length	196 ft.
Width (overall)	39 ft. 6 in.
Height (overall)	52 ft.
Engine and h.p.	2—150 h.p. Sunbeam
Gross lift	4.94 tons.
Disposable lift	1.6 tons.
Speed (full)	52 m.p.h.
Crew	5.

THE C. STAR CLASS.

In accordance with a custom of Naval terminology, the designation "C. Star" indicates a modification of the "C." i.e., the Coastal type of airship. Airships of this class were intended primarily for convoy escort duty over greater distances than could be undertaken by the S.S. Zero craft.

The envelope is rigged on the Astra-Torres tri-lobe principle, and is practically a replica on a smaller scale of the N.S., which made its advent at an earlier date.

The capacity of the C. Star is 210,000 cubic feet, as compared with the 170,000 cubic feet of the Coastal, producing an increase in lifting power of approximately one ton and a quarter.

The car remains substantially the same as the Coastal car, but is fitted with engines of a different type. A Berliet of 110 h.p. is installed in the forward mounting, where the efficiency of the propeller is impaired by the large car in its wake, and a 260 h.p. Fiat is placed in the mounting aft. Both these engines are designed on the lines of the Mercédès, and are remarkably reliable.

No gun-platform is fitted on the top of the envelope, as in the Coastal.

In order to assist in distributing the weights evenly along the envelope and to reduce the tensions in the car suspensory cables —some of which are acutely inclined forward and aft—the petrol is carried in tanks suspended inside the gasbag.

The equipment of a C. Star airship includes W/T. installation, emergency power-driven air blower, floatation bags, and a collapsible lifeboat, to be inflated with air, as well as the usual airship grapnel, drogue, and signalling appliances.

CHARACTERISTICS.

Capacity	210,000 cu. ft.
Length	218 ft.
Width (overall)	49 ft. 3 in.
Height (overall)	57 ft. 6 in.
Engines	One 110 h.p. Berliet forward, one 260 h.p. Fiat aft.
Gross lift	6.46 tons.
Disposable lift	1.8 tons.
Full speed	50 kts. (57.5 m.p.h.).
Cruising speed	35 kts. (40.3 m.p.h.).
Crew	5.
Cost (war price)	£12,750.

THE N.S. CLASS.

The "North Sea" type airship, which was designed for long range reconnaissance, perpetuates the "Astra-Torres" principle in a vessel of considerable size. It is most readily recognised from the "C. Star" type by the large enclosed car and the arrangement of the twin engines behind the car, and placed side by side. Conspicuous also are the large twin air pipes which scoop the slipstream from the airscrews to the air ballonets, along big air ducts running fore and aft.

The vessel has no landing carriage, but floats are provided for alighting on the water if necessary. The control planes are of conventional type.

Petrol is carried inside the envelope in cylindrical tanks suspended at intervals from the internal rigging girdles at the top "ridges" of the envelope. This method of suspension results in more equitable load distribution, relieving the envelope of the stresses that would be set up were the weight of petrol concentrated in the car, and so reducing the liability of the envelope to lose its longitudinal alignment at low pressure. As petrol is consumed from various tanks, air may be blown into contiguous ballonets to trim the ship.

In the latest model of the N.S. airship, the car has the same height from end to end to give head room.

An engineer's cabin is situated in the space between the engines at the rear. Sleeping bunks and means of heating food by the engine exhaust are provided.

Many notable duration flights have been performed in the course of patrol duties by N.S. airships, including a non-rigid endurance record of 101 hours, 50 minutes.

CHARACTERISTICS.

Capacity	360,000 cu. ft.
Length	262 ft.
Width (overall)	56 ft. 9 in.
Height (overall)	69 ft. 3 in.
Engines and h.p.	Two 260 h.p. Fiat
Gross lift	10.85 tons.
Disposable lift	3.8 tons.
Full speed	50 kts. (57.5 m.p.h.)
Cruising speed (½-power)	37 kts. (42.6 m.p.h.).
Crew (two watches)	10.

"The engines worked

The wonderful achievement of R 34 in making the double journey across the Atlantic affords ample proof of the efficiency of Sunbeam Coatalen Aircraft engines and machinery. This was no single flight of a few hours' duration, but a voyage of 183 hours. Never before have any aircraft engines had to withstand such continuous strain.

Having twice crossed the Atlantic, made numerous patrols and trials and journeyed from end to end of Germany, R 34 has travelled a distance roughly equal to 15,000 miles or 300 hours' actual flying—every performance on SUNBEAM - COATALEN Aircraft Engines.

II.—BRITISH RIGID AIRSHIPS.

R24—one of the early British rigids—moored out to a mast during recent mooring tests.

THE RIGID 23 CLASS (R23—R26).

R23, designed and constructed by Messrs. Vickers, Ltd., was put into commission in 1916 as a training airship.

R24 (built by Wm. Beardmore and Company), R25 (built by Armstrong, Whitworth, Ltd.), and R26 (Vickers Ltd.), followed in 1917, and were also utilised for training and experimental purposes.

The hull, composed of Vickers type duralumin lattice girders, is divided by transverse frames into 18 gas compartments, the gasbags containing a total of 942,000 cubic feet of gas when full.

A V-section keel, built of duralumin and steel tubes, extends under the hull from near the bows to join the lower vertical fin at the tail. A portion of the forward half of the keel is widened to form a cabin, in which the W/T cabinet and quarters for the crew are located.

Each gasbag is fitted with one automatic gas valve discharging to one side and a top manœuvring valve actuated from the control cabin.

The outer cover is of doped linen.

As originally produced, the forward and aft gondolas were each partitioned into two compartments, a control cabin, and an engine room. The main control position was in the leading gondola. Each of these gondolas was equipped with a 250 h.p. Rolls-Royce engine, driving a pair of 4-bladed swivelling propellers through suitable gearing.

Subsequently the after gondola was removed and its place taken by a light power-car containing an engine with direct transmission to a single 2-bladed propeller.

The car suspended amidships accommodates two engines, also of the Rolls-Royce 250 h.p. type, each coupled through bevel gearing to a 4-bladed propeller on either side of the car. Swivelling gear is not provided for these propellers.

Above the bows of the airship is a gun platform, which is reached by a climbing shaft passing between gasbags two and three.

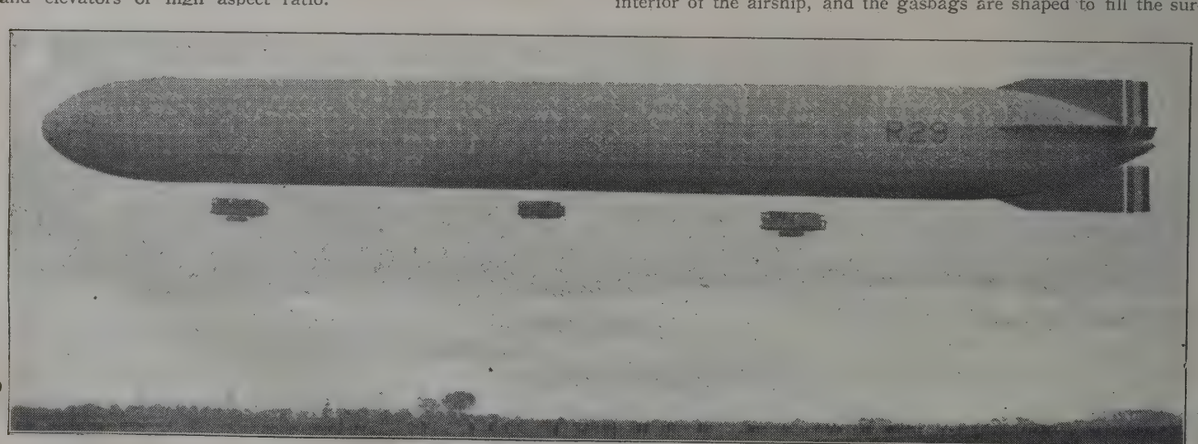
Cruciform stabilising fins are fitted, and balanced rudders and elevators of high aspect ratio.

Judging from the standard of the more modern rigid airships, the performance of the R23 Class is poor. The best flight which has been accomplished is one of slightly over 50 hours. The value of the class has been principally manifested in the experience afforded to those concerned with its construction and operation.

CHARACTERISTICS.

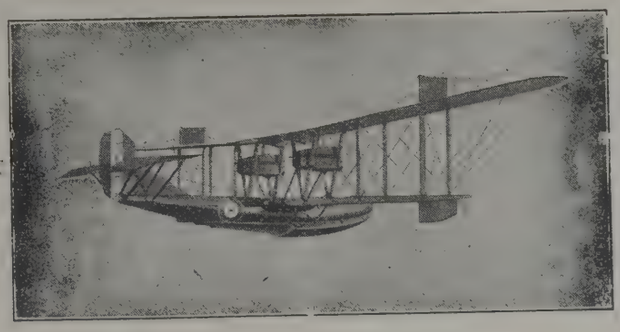
Capacity	942,000 cu. ft.
Length	535 ft.
Diameter	53 ft.
B.H.P.	1,000.
Gross lift	23.6 tons.
Disposable lift	5.8 tons.
Maximum speed	45.2 kts. (52 m.p.h.).
Cruising speed	35 kts. (40 m.p.h.).

THE R23X CLASS.



This class comprised two airships, R27 and 29, constructed in 1917-18 to Admiralty design by Messrs. Wm. Beardmore and Co. (R27) and Messrs. Armstrong, Whitworth and Co. (R29). It was originally intended to build four airships of this type, but as a result of the acquisition of L33, R28 and R30 were cancelled.

In many essentials the R23 X class airships are similar to R23. The dimensions are nearly the same, and the only obvious point of difference is the omission of the keel.



It should be understood that the function of the keel in rigid airships is primarily that of distributing the weights of petrol, oil and water-ballast between the transverse bulkheads of the hull, and, as a rule, it contributes little more than 5 per cent. to the total strength of the hull structure.

In the R23 X class, these weights are concentrated at the bulkheads, where they are suspended from the radial wiring which maintains the polygonal shape of the hull. A keel is therefore unnecessary, and a considerable saving of weight is secured.

To enable the crew to pass from one gondola to another, a ∩ shaped corridor of light tubular construction is carried through the interior of the airship, and the gasbags are shaped to fill the sur-

R29, sister ship of R27, of the keelless R23X Class.

rounding space. In all other details, these airships follow closely the lines of R23. The gondolas and power plant are arranged similarly to those of R23 as first designed, with swivelling gear for the forward and aft propellers.

CHARACTERISTICS.

Capacity	990,600 cu. ft.
Length	539 ft.
Diameter	53 ft.
B.H.P.	1,000
Engines	Four Rolls-Royce "Eagle," Mark III, 250 h.p.
Gross lift	30.1 tons
Disposable lift	8.5 tons.
Maximum speed	48 kts. (55 m.p.h.).
Cruising speed	37 kts. (42.75 m.p.h.)

THE R31 CLASS.

R31 and R32 were constructed by Messrs. Short Bros, at Bedford, to designs based upon "Schütte-Lanz" principles furnished by the Admiralty. Owing to the effects of dampness on the plywood used in the construction of R31 this airship has been condemned.

It is to be noticed that the construction of the hull bears no resemblance to that of the pre-war "Schütte-Lanz" trellis system, and is analagous to the Zeppelin arrangement, which was adopted for the later S.L. ships.

Each of the principal girders in R31 consisted of three plywood sides, lightened with slots at regular intervals, which were glued to spruce angle-members more or less of V section. The triangular girder thus formed was strengthened internally by plywood diaphragms. This method of construction was used for all varieties of girders, including square and rectangular sections.

Casein cement, known as Kaltleim, was adopted as an adhesive.

The gasbags, 25 in number, were made of rubber-proofed cotton fabric, lined with goldbeaters' skin.

A keel corridor extended from end to end inside the bottom of the hull, serving to support and distribute the weights of petrol, water ballast, etc.

The control car under the bows of the airship was divided into three compartments; forward the navigating cabin, next the wireless room, and aft the officers' sleeping quarters.

As initially tested, R31 had six boat-built power gondolas, arranged in pairs. Subsequently, however, one of the rear gondolas was removed and the remaining one slung parallel with the centre line.

Each gondola contained a 250-h.p. Rolls-Royce engine, driving through clutch transmission a two-bladed propeller. Reversing gears were fitted to those amidships.

CHARACTERISTICS.

Capacity	1,553,000 ft.
Length	615 ft.
Diameter	65.5 ft.
Engines and h.p.	5—250-h.p. Rolls-Royce (1,250)
Gross lift	47.1 tons
Disposable lift	16.4 tons
Maximum speed	65 m.p.h.
Cruising speed	46 m.p.h.
Crew	21

THE R33 CLASS.

Two airships of this class, completed in 1919, were constructed by Messrs. Armstrong, Whitworth & Co. (R33) and Messrs. Beardmore & Co. (R34). The designs were prepared by the Admiralty from data acquired from the wreck of Zeppelin L33, brought down at Little Wigborough in 1916.

The hull, streamlined over the greater part of its length, has the sectional shape of a 25-sided polygon, and is composed of 20 main circumferential girder frames and 25 longitudinal girders, one at each corner of the polygon. An auxiliary circumferential frame is interposed between each pair of main frames, and the whole is braced diagonally by high tensile steel wire. There are 19 gas chambers.

At each bulkhead, radial wires of steel wire rope are connected centrally to an axial plate, and a jackstay runs from plate to plate, bracing the bulkheads together longitudinally.

Along the inside of the bottom of the hull is a keel-corridor, formed of A-shaped girder frames. As well as accommodating the petrol, water ballast, and bombs, the keel provides means for the crew to pass from one gondola to another, for which purpose a walking-way girder is interposed between the two lower longitudinals of the hull.

A top gun platform is situated above the third main frame, near the bows, and at the after end of the airship a lightly built prolongation of the corridor gives access to a gun-pit at the extremity of the stern.

The tail fins and control surfaces are cruciform in arrangement and constructed of duralumin girders, covered with doped linen.

The gasbags are shaped to fill as completely as possible the interior of the hull, surrounding the sides of the corridor when full. They are made of a single thickness of rubber-proofed cotton fabric lined with goldbeater's skin; finished weight not more than 160 grams per square metre. An automatic gas release valve is fitted to each bag, discharging near the bottom through exhaust shafts running to the top of the airship between each alternate pair of gasbags. Certain bags are also furnished with hand-controlled manœuvring valves.

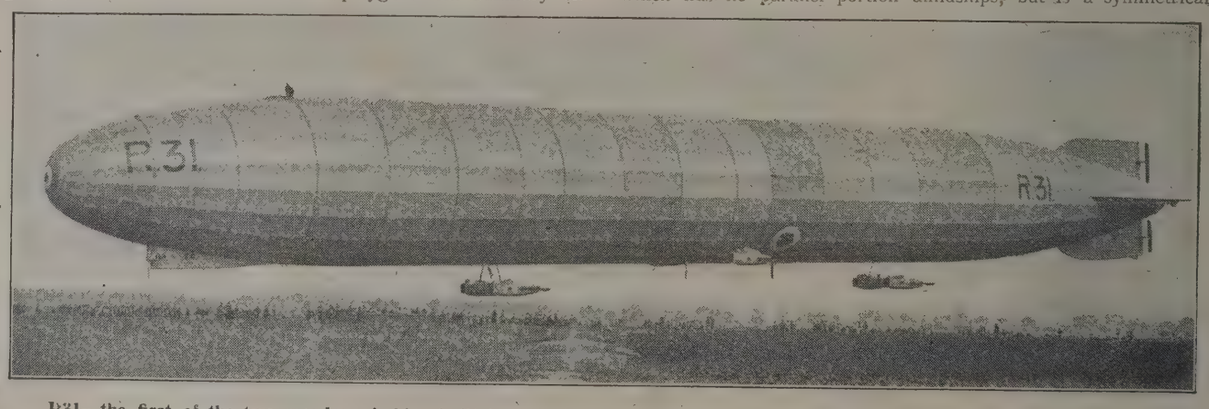
The outer cover is made of doped linen, tightly stretched between each pair of main circumferential frames.

The forward gondola, although apparently homogeneous, is built in two parts separated by a small gap. In the leading section are the controls and wireless cabinet, and in the section behind is an engine coupled through a clutch to a propeller at the rear.

Approximately amidships, two small "wing" gondolas are attached to the hull side by side, each one housing an engine. Reversing gears, for use in braking the airship whilst landing, are fitted between the engines and propellers in these cars.

The sternmost gondola accommodates two engines, geared to drive one large propeller. In this respect, the R33 Class airships are similar to the German L40, and differ from L33 by the omission of the shaft-driven "wing" propellers and one of the three engines installed in the after gondola of that ship.

CHARACTERISTICS.



Capacity	1,950,000 cu. ft.
Length	643 ft.
Maximum diameter	78.75 ft.
Engines and h.p.	5—250 h.p. Sunbeam "Maori" (1,250).
Gross lift	59.2 tons.
Disposable lift	30 tons.
Maximum speed	62 m.p.h.
Cruising speed	45 m.p.h.
Crew	22.

THE R80.

A rigid airship designed and put into construction in November, 1917, by Messrs. Vickers, Ltd., at Barrow. It is to be completed during the latter half of 1919, and, unless employed for commercial demonstrations, will probably be taken over by the Admiralty.

Compared with contemporary rigid airships it is small in size, having a gas capacity of 1,250,000 cubic feet. It is, however, designed on up-to-date lines, and may be expected to prove highly efficient within the limitations imposed by its small dimensions.

An advance upon other rigid airships is the shape of the hull, which has no parallel portion amidships, but is a symmetrical

R31—the first of the two wooden airships built by Short Bros—with the original twin-power cars aft, which have since been replaced by a single car.

The R80. A Vickers ship of the latest type.

streamline form throughout its length. The construction and general arrangement of the hull, including the internal keel-corridor, conforms generally with the recognised principles of rigid airship design, but incorporates several minor improvements in detail devised by Messrs. Vickers. Patent bow mooring attachments are fitted.

The gasbags are 15 in number. Cruciform tail fins and balanced elevators and rudders are fitted and two gun positions, one above the bows and one in tip of the stern, these features are reminiscent of the practice in R33.

A point of recognition is the arrangement of the gondolas, of which there are three—one large gondola forward and a pair of "wing" power cars approximately amidships. The fore gondola is composed of two sections, flexibly connected, the leading section containing all the controls for the airship and the W/T cabinet.

Four 240 h.p. Wolseley-Maybach engines provide propulsive power, two engines being installed en echelon in the after section of the forward gondola, and one each in the twin "wing" cars. A propeller is mounted at the rear of each gondola, and the transmission is such that the forward propeller can be driven by either of its two engines separately or both together, whilst the "wing" car propellers may be reversed.

It is stated that R80 will have a full speed of over 60 miles per hour, and be capable of crossing the Atlantic. The endurance at cruising speed of 45 m.p.h., with a maximum load of fuel, will presumably be about 75 hours.

CHARACTERISTICS.

Length	535 ft.
Diameter (overall)	70 ft.
Capacity	1,250,000 cu. ft.
Engines and h.p.	Four 240 h.p. Maybach
Gross lift	36.5 tons.
Disposable lift (estimated)	15 tons.
Full speed (normal)	60 m.p.h.
Cruising speed	45 m.p.h.
Crew	20.

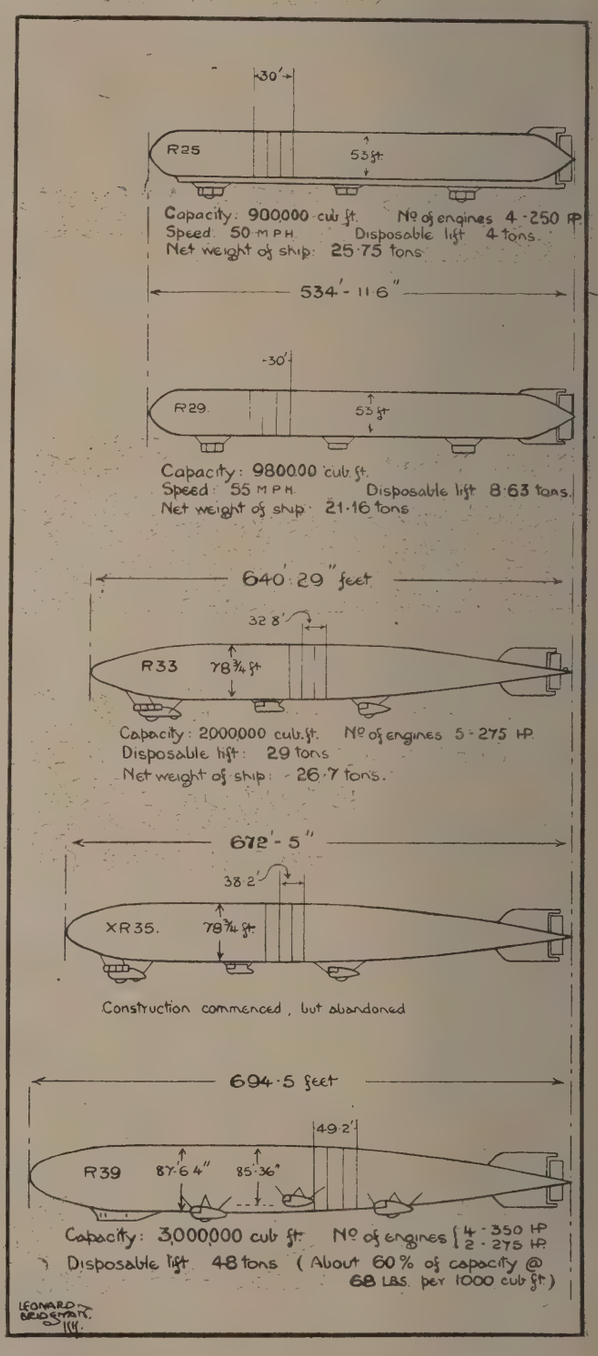
R35—R40 (PROJECTED).

Beyond a statement in the House of Commons to the effect that six rigid airships of improved types are being built to the order of the Admiralty, little official information has been vouchsafed as to the size and capabilities of the new vessels.

From reports which have appeared in the newspapers, however, it is to be deduced that two airships, R36 and R37, are being built of practically the same type as the R33, each with a capacity of about 2,000,000 cu. ft., and three larger vessels.

Since no mention is made of a possible R35, it appears that this number has not been allocated, or has been cancelled. Thus, the total of six airships presumably comprises R80, R36 and 37, and a new class R38, 39, and 40.

The "R38 Class" is referred to in the official "Notes on Airships for Commercial Purposes," in which it is stated that the capacity will be 2,720,000 cu. ft. and that the cruising endurance at 45 miles per hour is estimated to be 211 hours, or 34 hours greater than the German L70.



Some figures relating to the dimensions and lifting capacity of these new airships have been published in the Press, and these, supplemented or checked by obvious calculations, furnish the following details:—

CHARACTERISTICS (R38 CLASS).

Length	695 ft.
Diameter (overall)	87.6
Capacity	2,720,000 cu. ft.
Engines and h.p.	Four 350 h.p. Sunbeam "Cossack" Two 275 h.p. Sunbeam "Maori"
Gross lift	82 tons
Disposable lift (estimated)	50 tons
Speed, full (estimated)	70 m.p.h.
Crew (estimated)	30

In connection with the specifications given above the attached diagram, reproduced by courtesy of Sir W. G. Armstrong, Whitworth and Co., Ltd., and representing to a uniform scale the airships so far built by that firm, gives a graphic idea of the evolution of British-built rigids in the last two years.

(Continued on page 750.)

Are Motorists Lazy?

A well-known writer says:

"The A.A. is helping to make them so."

"Speaking as one who has never looked for a salute from A.A. patrols, but who has invariably received it, I have always appreciated their unfailing courtesy and willingness even to go out of their way to assist,

and that is, I think, the experience of most road users, but all the same, I confess to a feeling that in wanting to do so much for the motorist in roadside repairs and tyre changing, the A.A. is quite unconsciously helping to make motorists the laziest people on the road."

The above paragraph, taken from a motoring article in a London daily paper, though acknowledging the efficiency of the Automobile Association's Road Service does not do justice to its comprehensive character.

The khaki-clad A.A. patrol also gives reliable road information, warns members of bad road conditions and indicates alternate routes, renders first aid to man and machine, recovers property dropped on the road, procures replacements, and generally assists member in road difficulties.

The Roadside Telephone Service—of which the A.A. was the pioneer and remains the sole provider—includes a telephone installation in each patrol's sentry box which is at the service of any member passing.

Officially appointed A.A. Repairers undertake repairs in an efficient manner and provide replacements at reasonable charges whilst A.A. Hotels can be depended on for accommodation really satisfactory to Motorists.

In addition the A.A. supplies members with special routes to any part of the country and provides Free Legal Defence in any police court in the United Kingdom to answer charges under the Motor Car Act or D.O.R.A.

Whether the above privileges tend to make motorists lazy is a debatable point, but there is no denying the fact that they are of great benefit to and much appreciated by members of the Automobile Association.

If you are not a member of the A.A. send a post card to-day to the Secretary, The Automobile Association, 41, Fanum House, Whitcomb Street, London, W.C.2. for a free booklet and other information which will show you how to motor in comfort and safety.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

The present number of "Aeronautical Engineering" is entirely devoted to articles dealing with the design, construction, and use of airships.

An article contributed by the airship department of Vickers, Ltd., deals with the prospects of airships for long-distance commercial transport. This contribution gives detailed estimates of the cost of long-distance airship passenger and mail services, together with technical details as to the type of ship suggested.

A description of the war productions of Vickers' Aircraft Department is also given.

By courtesy of Sir W. G. Armstrong, Whitworth & Co., Ltd., a description of the methods which have been adopted in the assembly and erection of large rigid airships at their Selby works is given. Some idea of the magnitude of the task and the difficulties overcome by British airship builders may be gained therefrom.

Sir Wm. Beardmore & Co., Ltd., have supplied a description of the actual process of building the trans-Atlantic airship R.34.

Short Bros., Bedford, have supplied a description of H.M.A. R.32, a rigid airship built entirely of wood, and also a description of a novel airship of their design.

Airships, Ltd., describe the uses of non-rigid airships.

An article by Major P. L. Teed gives a summary of the methods employed to compute the lift of hydrogen used in airships under varying conditions of purity, temperature, and pressure.

AIR TRANSPORT SERVICES.

A DISSERTATION ON THE POSSIBILITIES OF AIRSHIPS IN COMMERCIAL AERONAUTICS.

[The following paper has been produced by the Airship Department of Vickers, Ltd., of Barrow-in-Furness.—Ed.]

SECTION I.

SUMMARY OF THE MOST IMPORTANT CONCLUSIONS.

The outstanding and peculiar advantage of the airship for air transport is its capacity for making non-stop voyages of long duration. On account of inherent limitations, the aeroplane will probably never—unless some radically new principle of design is discovered—be capable of carrying a passenger load for greater non-stop distances than 2,000 miles, and for economical operation will probably never be used for non-stop flights of more than 1,000 miles; whereas, on the other hand, the only limit to the non-stop length of flight that can be made by an airship is determined by the size of ship, and 10,000 miles is quite practicable.

An airship of the size described in this paper, of a capacity of 3,500,000 cubic feet, which could be built immediately and be housed in existing sheds, can carry 15 tons of passengers, mails, etc., for an air distance of 4,300 miles, at a speed of 60 m.p.h., and it would be quite a practicable proposition to build a rigid airship to carry 50 tons of passengers and freight for a non-stop voyage of 10,000 miles, at a speed of 80 m.p.h. It therefore may be definitely accepted that for voyages on which it is necessary to make a non-stop flight between points more than 2,000 miles distant the airship is the only means of aerial transport possible, and it may also be safely stated that the airship will always be the most economical means of transport for non-stop voyages of more than 1,500 miles. It therefore is inevitable that the airship will hold the field for long-distance cross-oceanic air voyages.

COST OF OPERATION.

As a basis for comparative figures, the direct non-stop passenger voyage from London to New York (a minimum distance of 3,000 miles) has been considered, and an analysis made of the cost of operating a service of two crossings in each direction per week, giving a carrying capacity of 30 tons of passengers, mails, etc., in each direction. Details of this cost analysis are given in Section V.

The results may be summarised as follows:—Capital required, £2,600,000. Allowing 10 per cent. on capital, and a high rate of depreciation and insurance, etc., the cost of operation would be as follows:—Carrying passengers from London to New York, £48 per head, which is equivalent to 4d. per passenger mile. The rate for mails, etc., would be 3d. per ounce. The time taken for the journey would be two-and-a-half days from London to New York by the southerly route, and two days from New York to London by the direct route.

It is impossible to run an aeroplane service direct from London to New York, but with the largest and most efficient machines at present considered practicable, it would be possible to run a London to New York service with the intermediate stops in Ireland and Newfoundland for replenishment of fuel, etc.

An analysis of the cost of running an aeroplane service on this basis is given in Section XII, from which it will be seen that to give the same service as the airships proposed, the capital required would be £3,850,000, and the cost of operation on the same basis as the airships would be: Passenger rate, from London to New York £115, which is at the rate of ninepence per passenger mile. Mails at the rate of 7½d. per ounce.

The time taken, allowing for stops in Ireland and Newfoundland, would be two days.

It is therefore seen that for a regular and established service, the cost of Atlantic transport by airship is less than half of that by aeroplane, and the time taken practically the same.

It must, however, be pointed out that if the airship stopped at the intermediate points as necessary for the aeroplane, a considerably greater amount of passenger load could be carried, and the relative cost by airship would be further decreased.

With the development of airship transport to the most distant centres of the world, it is conceivable that no important city will be further from London than 10 days' journey, and the following table gives the times that would be taken to reach several important cities when airship ocean routes are in operation:—

TIMES FROM LONDON IN DAYS.—To New York, 2-2½; San Francisco, 4½; Cairo, 1½; Colombo, 4½; Perth, 7; Nairobi, 3½; Capetown, 5½; Rio de Janeiro, 4.

As the maximum distance of direct flight between intermediate stations required to get to any of these centres is not more than 3,500 miles, it would be practicable to run these services with the size of airship described in this paper, and the cost of operation for a regular service would be approximately as for the Atlantic service, i.e., passengers at the rate of 4d. per mile, and mails at the rate of 3d. per ounce, and with the development of large airships carrying greater loads, the cost of operation would be even more economical.

It is probable, in view of the immense benefits that would be conferred on civilisation by the great saving in the time required

for travelling, that the various Governments will be prepared to subsidise the development and operation of the airship services in their initial stages until a fully operated service could be established.

Incidentally, the commercial use of airships for passenger flights was demonstrated in Germany before the war, when the Hamburg-America Steamship Company ran a series of passenger airships for purely pleasure purposes at a profit, and carried 17,000 passengers without a single accident or mishap.

From the description of the type of airship proposed in Section VII, it is apparent that every reasonable provision can be made for comfort of the passengers, and suitable sleeping accommodation provided for the long journeys.

For the operation of airship services, aerodromes are only required at the terminal stations, and landing places with mooring-out towers need only be provided 3,500 miles or more apart.

The necessary amount of work in constructing the stations and preparing for the operation of an airship service is relatively small, whereas a long distance aeroplane service is only practicable if aerodromes can be provided every 1,000 miles, and for safety it would be necessary to have suitable landing grounds for use in case of forced landings no further apart than 100 miles.

The preparation and cost of all these aerodromes and landing grounds would represent a large amount of preparatory work required to be done before long distance aeroplane service could be put into practicable operation.

The problem of landing and housing the airship in stormy weather has now been solved by the use of the mooring mast or tower to which the airship is moored by the nose, and able to ride out in any weather clear of the ground. Arrangements are also provided whereby the airship can easily be moored to, or released from, the tower in any wind up to 60 miles per hour without difficulty. The passengers can get into or out of the ship by means of a lift in the tower. There consequently will be no need to put the airship into a shed except for periodic overhaul and refit.

SECTION II.

GENERAL REMARKS.

Although no claim is made that airships will seriously compete with ordinary transport services at present satisfactorily served by railway and ocean liners, there is no doubt that a sufficient number of passengers would be prepared to pay relatively higher rates for the great saving in time taken for long distance journeys, particularly for long sea journeys, and also to get a direct and fast service to important centres which are not at present served direct by railway systems or ocean transport.

The demand would mainly be for passenger traffic to serve the requirements of business men who require to get from centre to centre in the shortest possible time, and also for the carriage of express mail matter.

Other services on which large airships would be particularly useful would be:—

For carrying freight of high intrinsic value, such as transporting valuable ores and other commodities of high intrinsic commercial value from places otherwise inaccessible, or not provided with other means of direct transport.

In making preliminary exploration of large virgin tracts of country for the purpose of constructing railway tracks, etc., a great amount of laborious exploration work would be eliminated.

There are also great possibilities of obtaining a profitable return by running airships for pleasure trips from seaside or other resorts in the summer months, where an almost unlimited number of people would pay a good price for airship cruises.

A particular instance for which it is thought such services could be profitably run would be at Blackpool, where pleasure cruises could be run to the Isle of Man, or to the Lake District.

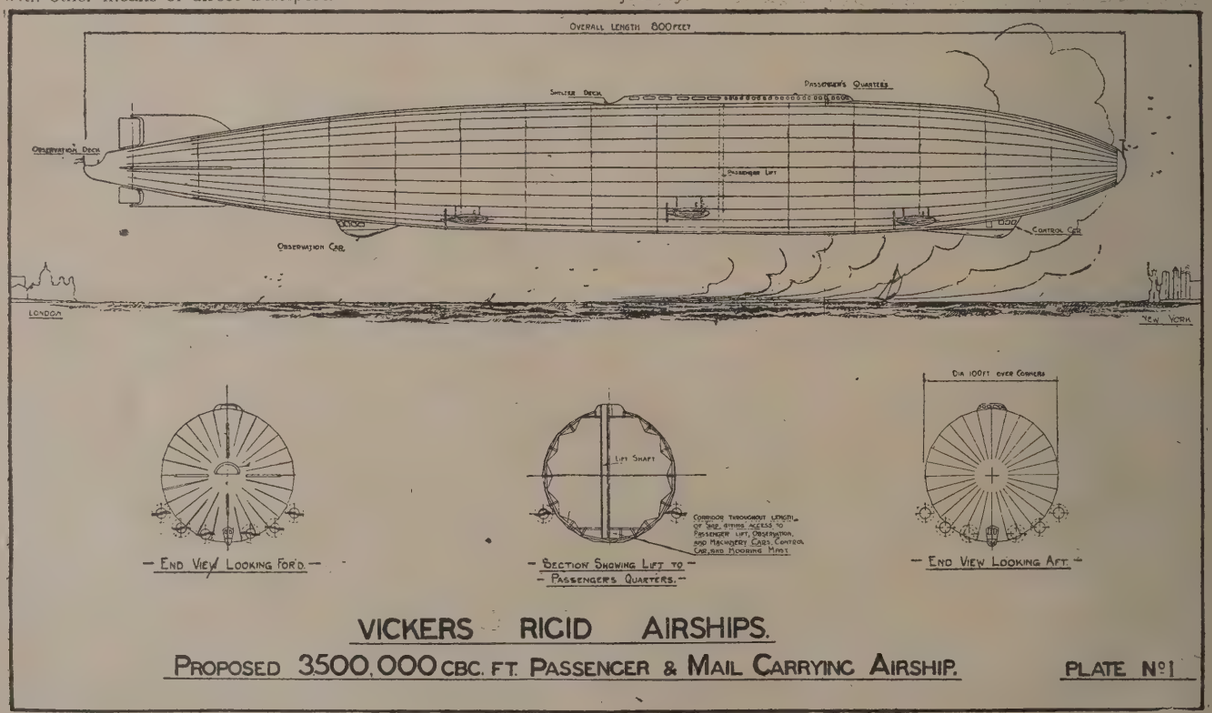
There might also be a limited demand from private owners for a small non-rigid airship, to carry two or three passengers, which could be run at much the same cost as a small yacht.

It is probable that in order to meet the requirements of these various purposes for which airships conceivably will be utilised airships will be designed of three classes, viz.:—

First, the airship of moderate size and high speed, for carrying express mails and passengers.

Secondly, the passenger liner for passenger traffic, of a large size, and high speed.

Thirdly, large airships of comparatively slow speed and large carrying capacity, for general transport.



The small non-rigid airship will hold the field for use for private purposes.

The rigid airship is as yet only at the beginning of its development, particularly as regards size and carrying capacity. The airship of 3½ million cubic feet capacity—the size proposed in this paper—for immediate use on the fast passenger services, which would have a maximum speed of 75 m.p.h., and would carry a useful load of passengers of 15 tons, for a distance of 4,800 miles, could be built immediately and could be housed in sheds at present available. As, however, the lift and speed efficiency of a rigid airship increases rapidly with increase of size, it will be advantageous to use the largest airships that can be economically operated, and a rigid airship able to carry 50 tons of passengers and freight for 10,000 miles, at a speed of 80 m.p.h., is quite feasible, and the design and construction of such an airship could be undertaken immediately it would be justified by developments in the demand for air transport.

Passenger cruises on a commercial scale were operated in Germany for about four years before the war by the Hamburg-America Steamship Company, and it is understood that companies have been formed in Germany for Zeppelin airship services from Berlin to Constantinople, and notices have recently appeared in the Press that the German Zeppelin Company is now actually building airships for the Berlin-New York service and other routes.

Notices have also recently appeared in the Press to the effect that the Spanish Government have decided to make inquiries into the possibilities of running trans-Atlantic services from Spain to the United States of America.

It is conceivable that by the development of aerial transport no important city will be further from London than 10 days' journey.

SECTION III.

Proposed Services and Routes.

The advantages of airship transport will be most apparent for long ocean journeys, and it is believed that the best route for the first service would be between London and New York, as this is the route on which there is the greatest demand for a saving in the duration of voyage, and a large amount of passenger traffic would be immediately available once the advantages of the service were demonstrated.

London to New York.—This is dealt with in detail in Section IV.

After the establishment of the Atlantic service, other services on which airship transport would effect great economies in time would be the following:—

London to India and Australia.—London to Cairo, 2,050 miles; Cairo to Colombo (*via* Aden), 3,400 miles; Colombo to Perth (Australia), 3,150 miles.

At an average speed of 60 m.p.h., and with a stop of 12 hours at each station for re-fuelling, etc., the times taken would be the following:—London to Cairo, 34 hours, or 1½ days; London to Colombo, 34 plus 12 plus 58 hours equal 104 hours equal 4⅓ days; London to Perth, 104 plus 12 plus 52 hours equal 168 hours equal 7 days.

By train and mail steamer the journey to Ceylon at present takes 15 days, and to Australia takes over 30 days.

Cairo to Capetown.—Cairo to British East Africa (Nairobi), 2,100 miles equals 35 hours; British East Africa (Nairobi) to Capetown, 2,200 miles equals 37 hours. Total time from Cairo to Capetown, allowing stop for twelve hours at Nairobi equals 84 hours, or 3½ days; or from London to Capetown, 5⅓ days.

Further than the saving in time in the actual journey, there is the saving by using an airship service in the elimination of the time taken for trans-shipping and waiting at the various ports, etc., where the aerodromes could be situated quite close to the terminal stations.

Owing to the variation in weather conditions, there would be, of course, some latitude in the time of arrival at the destination, but in those cases where there is a saving of several days in the total journey the variation of a few hours in the time of arrival would not be of much account.

Size of Airship Required for the Above Services.—It will be noted that the maximum distance of voyage required for any of the services stated above is 3,500 miles, which at a speed of 60 m.p.h. would require a ship able to fly at this speed for a minimum of 60 hours, and in order to allow for loss of time on the way, owing to adverse weather or other reasons, it is considered that an airship able to do 80 hours' flight at a speed of 60 m.p.h. would meet all the conditions.

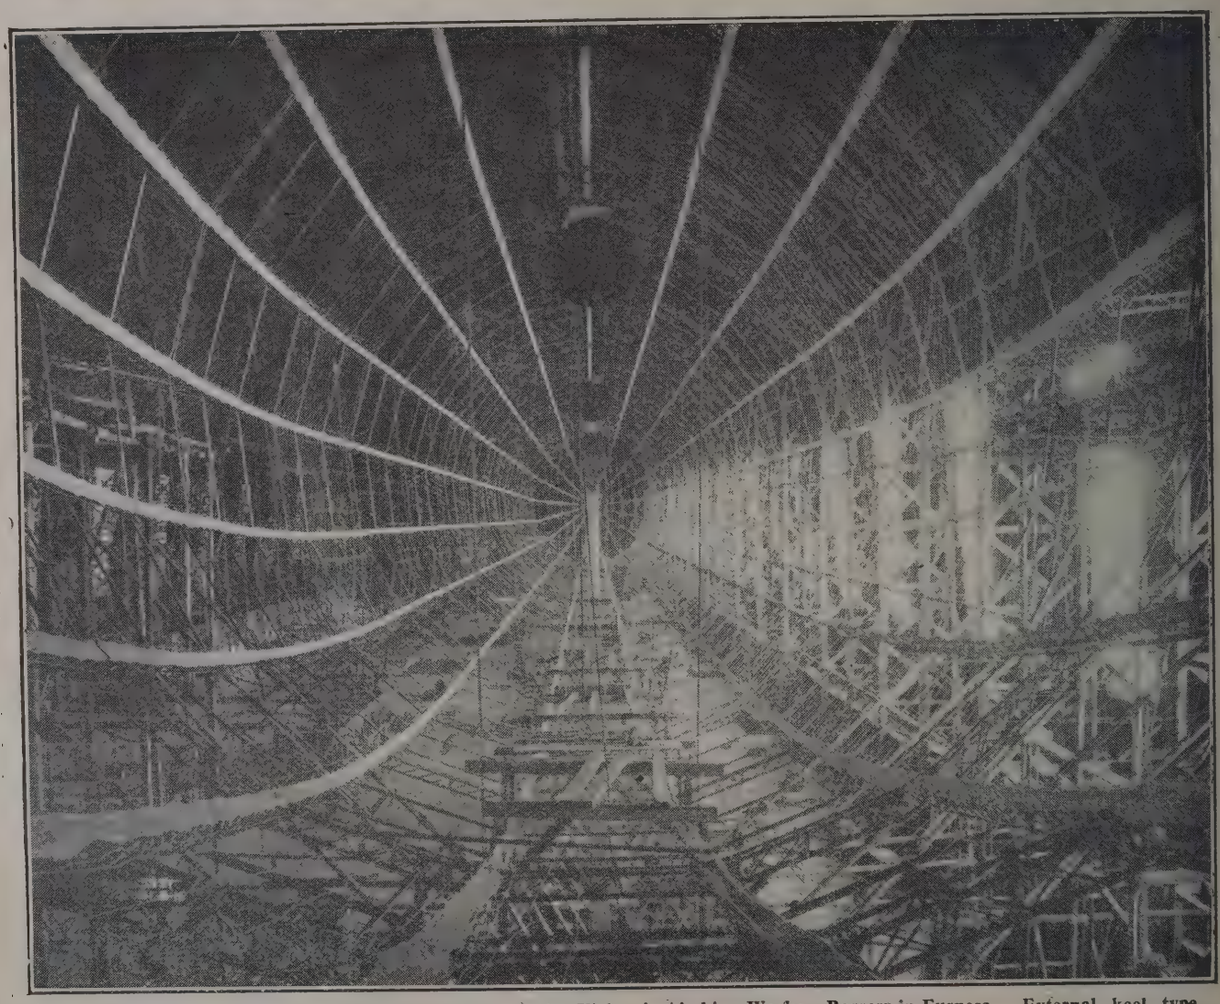
It is proposed that the airship should have a full speed at maximum power of 75 m.p.h., but she would generally only fly at reduced power, giving a speed of 60 m.p.h., the additional power being held in reserve to enable the additional speed to be utilised for getting through storm areas or going against adverse winds.

SECTION IV.

Proposed London to New York Service.

1. Specification of Proposed Airship (see Plate I.):—
(A complete specification is given in Section VII.).

The main particulars to be as follows:—



Gross gas capacity	3,500,000 cubic feet
Normal total lifting power	105 tons
Disposable lift	68 tons

(The "disposable lift" is that available for fuel and oil, stores, crew, passengers, and mails.)

Total engine power	3,500 b.h.p.
Speed at full power	75 m.p.h.
Normal flying speed with 2,000 b.h.p.	60 m.p.h.
Consumption of petrol	0.5 lbs. per b.h.p./hour
Consumption of oil	0.03 lbs. per b.h.p./hour

2. Proposed Crossing Routes.

Prevailing wind on the direct route (London to New York) is almost always from west to east, which would of course always favour the east-bound journey, but is unfavourable to the west-bound journey.

View inside the skeleton of a rigid Airship at the Vickers' Airship Works, Barrow-in-Furness. External keel type.

CIVIL FLYING

WITH

THE SOPWITH "DOVE" 2-SEATER
SPORTING MODEL

COMFORT AND ECONOMY

The Sopwith "DOVE" is a sporting and utility aeroplane, based, in point of design and general arrangement, upon the famous Sopwith "PUP."

With its fast climb, high-speed, quick manoeuvrability and wide-speed range it is an ideal safety-first pleasure aircraft.

Full details of performance and appointments for demonstration on application to

THE DESIGNER-CONSTRUCTORS,

Australia: THE LARKIN-SOPWITH AVIATION CO. OF AUSTRALASIA, LTD.,
18, GURNER STREET, ST. KILDA, MELBOURNE.

It is proposed, therefore, that the crossing eastward from New York to London should be made by the more direct route, and thus take advantage of the westerly winds; the distance direct by this route is 3,000 miles.

By making the west-bound journey by a southerly route, via the coast of Portugal, Azores, and on 35° N. parallel of latitude across the Atlantic, and then to New York, the voyage is made in a region where the prevailing westerly winds of the higher latitudes are absent, and only light winds are encountered, which are generally of a favourable direction.

The distance by this route, however, is about 3,600 miles, but with a ship speed of 60 m.p.h. it would be quicker to make the west-bound journey by the direct route if the westerly wind did not exceed 10 m.p.h. If the wind were greater than this, it would be quicker to go west by the southerly route *via* Azores. For information regarding prevailing winds, reference should be made to Section V.

As a basis for the times taken, the journey from London to New York via Azores is taken.

Although the speed of the airship at maximum power is 75 m.p.h., the crossing normally would be made at a speed of 60 m.p.h., which only requires 2,000 h.p. and is thus much more economical in fuel. The full speed, however, can be used whenever the ship has to voyage through any storm areas against strong head winds. By the southerly route, the time taken for the journey of 3,600 miles at a speed of 60 m.p.h. is 60 hours, but to allow for delays owing to adverse weather allowance is made for the airship always carrying 80 hours' fuel at 60 m.p.h.

The distances and normal times for the journey would therefore be as follows:—London to New York, *via* Portugal and the Azores, 3,600 miles; time taken, 60 hours, or 2½ days. New York to London by the direct route, 3,000 miles; time taken, 50 hours, or just over two days.

3. Service:—

It is proposed to have four airships for use on the cross-Atlantic service.

Two airships would only be in service at a time, and the other two standing by, so that each airship could lay up alternate weeks for overhaul and refit, etc.

As the time of journey etween London and New York will vary between 50 to 60 hours, each airship will therefore easily make two crossings or one double journey per week, thus giving a service with two airships of two "sailings" each way per week. The average time-table might therefore be as follows:—

Leave London.	Arrive New York.
Monday, a.m.	Wednesday, p.m.
Thursday, a.m.	Saturday, p.m.
Leave New York.	**Arrive London.**
Monday, p.m.	Thursday, a.m.
Thursday, p.m.	Sunday, a.m.

From available weather records, it is considered that crossings would be practicable on at least 300 days in the year, or 82 per cent. of the total days, so that it is probable that a total of 200 crossings in the year could be maintained.

It is probable that until weather conditions have been further studied, so that advantage can be taken of the best possible routes, that a regular service of two crossings each way per week could probably only be maintained at first in the months of May to September, and that the crossings in October to April would probably be irregular, the actual day of sailing being dependent on the weather conditions.

4. Crew Required:—

Two watches would be carried, who would take duty in eight-hour shifts, and both watches on duty when leaving or landing.

Each watch: Navigating officer, steersman, elevator man, four engineers, signalman for w.t. (eight men), also two stewards, commanding officer; total crew, 19 men.

Four crews would be in service between the airships, so that each crew would only make two crossings per week.

Weight of crew at 160 lbs. per man; personal effects at 20 lbs. per man; food at 10 lbs. per man per crossing; total weight, 190 lbs. per man. Total weight for crew, 190 × 19 = 3,600 lbs.

5. Passengers and Mails Carried:—

Weight per passenger:—Weight of man at 170 lbs., personal effects at 50 lbs. per man; food, etc., for journey at 15 lbs. per man; total, 235 lbs. per man.

Distribution of disposable weight for journey:—Crew and effects, 19 men at 190 lbs., 1.5 ton; fuel and oil for 80 hours at 60 m.p.h., 38 tons; starting ballast for 2,000 ft., 6.5 tons; emergency ballast, 5 tons; available for passengers and mails, 15 tons; total, 68 tons.

Fifteen tons would carry 140 passengers and effects, or 10 tons mails and 50 passengers.

SECTION V.

Estimated Cost of Running the Proposed Atlantic Service, London-New York.

The cost of running the service would be that necessary to cover the following charges, viz.:—(1) Interest on capital required, (2) allowances for depreciation, (3) insurance premiums, (4) operating expenses, (5) repairs and maintenance. Dealing with these items in detail:—

1. Capital Charges:—	Amount.
Four airships of 3,500,000 cubic feet capacity at £400,000 each	£1,600,000
Two double airship sheds at £300,000 each	600,000
Land for two sheds and aerodromes at £30,000 each	60,000
Workshops, gas plants, and equipment	150,000
Working capital, including spare parts, stores, etc.	170,000
Wireless equipment	10,000
Miscellaneous accessories	10,000
Total capital required	£2,600,000
Annual charge, interest at 10 per cent.	£260,000

2. Depreciation:—

(a) Airships.—Useful life, say 3 years. Obsolete value, say £20,000 per ship. Total depreciation per ship equals £380,000 in 3 years. Average total depreciation per annum for 4 airships for 3 years equals £507,000.

(b) Airship Sheds.—Useful life, say 30 years. Obsolete value in 30 years, 10 per cent. Total annual charges equal £18,000.

(c) Workshops and Plant.—Depreciation at 5 per cent. per annum equals £3,500.

(d) Land for Sheds and Aerodromes.—Value would probably increase owing to use as airship station, but is assumed as remaining constant.

Total annual charge for depreciation, £530,000.

3. Insurance Premiums:—

(a) On airship value at 10 per cent. per annum, average per year for 3 years	£110,000
(b) On sheds and plant at 2 per cent. per annum	13,500
Total annual insurance charges	£123,500

4. Annual Establishment Expenses:—

(a) Salaries of officers and crew:	
4 airship commanders	£4,000
8 airship officers	6,000
Total number crew hands equals 64	16,000
	£26,000

Girls at the Vickers Works making up Airship girders.

B.T.H. Magnetos

all-British in design and workmanship, were used **on the first Airship to cross the Atlantic, the R. 34,** on the aeroplanes which secured the British altitude record, and the first and second prize-winners of the Victory Aerial Derby at Hendon.

The above performances add to the record of B.T.H. Magnetos, and support the high opinion in which they were held by pilots during the war for reliability in service.

The British Thomson-Houston Co., Ltd.,
Lower Ford Street, Coventry, England.
Member of the British Ignition Apparatus Association.

B T-H

(b) Salaries of establishment:	
(i) Management and staff	£5,000
(ii) Workshop hands, storekeepers, etc., 50 at each shed (total 100)	£20,000
	£25,000
Total annual establishment expenses	£51,000
5. Repairs and Maintenance :—	
(a) Sheds and plant—annual charge, say	£5,000
(b) Repairs and overhaul of airships	£20,000
Total charge	£25,000
Totals of Annual Charges :—	
1. Interest on capital	£260,000
2. Depreciation	530,000
3. Insurance	123,500
4. Establishment expenses	51,000
5. Repairs and maintenance	25,000
Total annual charges	£990,500
Say	£1,000,000

Cost Chargeable per Crossing :—

The amount chargeable per trip comprises :—(1) Proportion of annual charges, (2) cost of fuel and oil per trip, (3) cost of hydrogen used per trip, and (4) cost of food for crew and passengers.

Taking the number of crossings per year as 200, London-New York :—

1. Proportion of annual charges per crossing	£5,000
2. Petrol for trip, 30 tons at £25 per ton (1s. 6d. per gallon)	750
3. Oil per trip, 2 tons at £40 per ton (2s. 6d. per gallon)...	80
4. Hydrogen used, 750,000 cub. ft. at 10s. per 1,000 cub. ft.	375
5. Cost of food per trip for crew of 19, and 100 passengers...	400
Total charge per crossing, London-New York...	£6,605

This is at the rate of 38s. per ship mile flown.

Carrying passengers, the rate would be :—London-New York, £48 per head, which is equivalent to 4d. per mile per passenger.

Rate for mails would be :—London-New York, £425 per ton, or 3d. per ounce.

It will be seen from the above that the direct running cost is 25 per cent. and the overhead charges 75 per cent. of the total cost.

SECTION VI.

Financial and Working Arrangements, and Government Subsidy.

It is considered probable that proposals for Government support for the establishment of airship services would be favourably considered, as the constant use of airships for commercial work would be the best possible means of developing and improving the design, as suggested by the constant experience obtained in service.

It would offer a means of keeping in constant training officers and crews who would be available for Naval service.

The type of airships used for passenger and mail transport could also be very well adapted for use in the Naval services should occasion require.

From the analysis of working cost in Section V, it may be justifiably be expected that airship services, when fully established and patronised, will be able to show a good working profit. It would probably require considerable financial support before the service will be so established as to ensure full support from passenger and mail traffic when it would be able to be run on a paying basis.

To establish and work trans-oceanic airship lines, it would be desirable to form a joint syndicate with a shipping company (e.g., the Cunard Line), who would undertake the organisation of the operation of the service and the necessary publicity; Vickers, Ltd., to build the necessary airships and provide the necessary technical staff and facilities for maintenance.

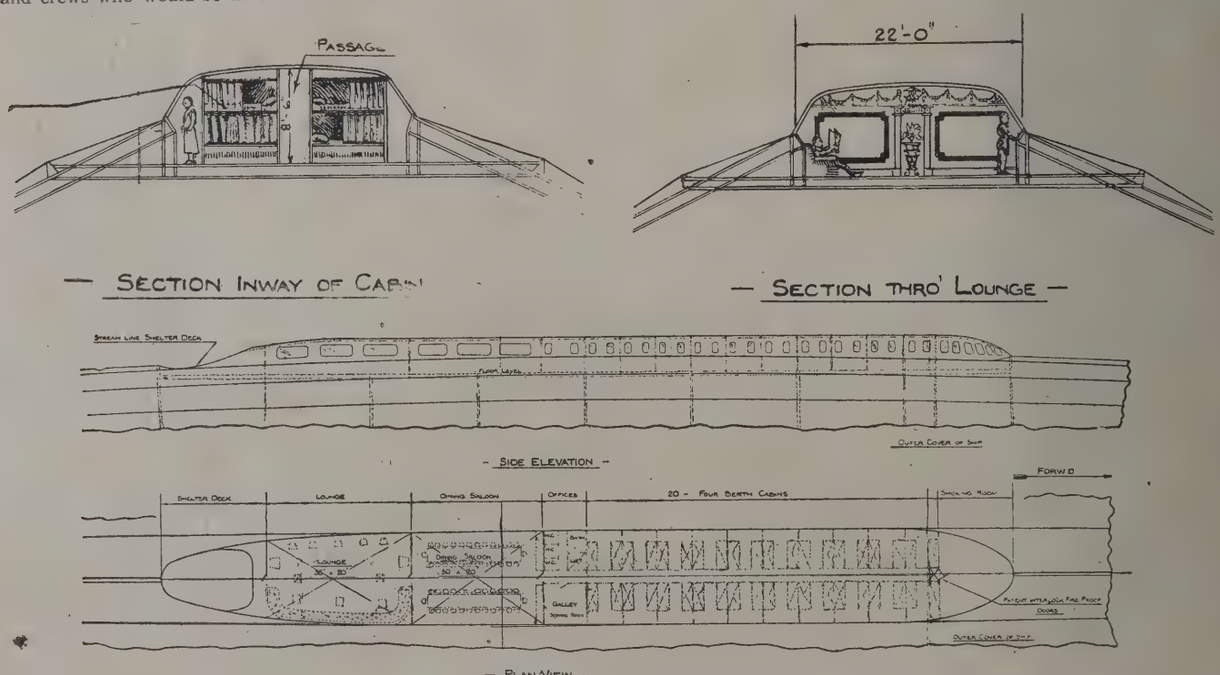
The Government subsidy to the airship companies would probably be on the following terms :—

1. Loan of airship sheds and flying grounds by the Government, free of charge, until the experimental stage is passed and the company is in a position to obtain the necessary capital for providing the requisite sheds and landing grounds for new services.

2. The loan of Naval airship crews and handling parties, until the service was established as a paying concern, and until officers and crews could be trained by the airship company.

3. The Government to pay a substantial subsidy for the conveyance of express mails.

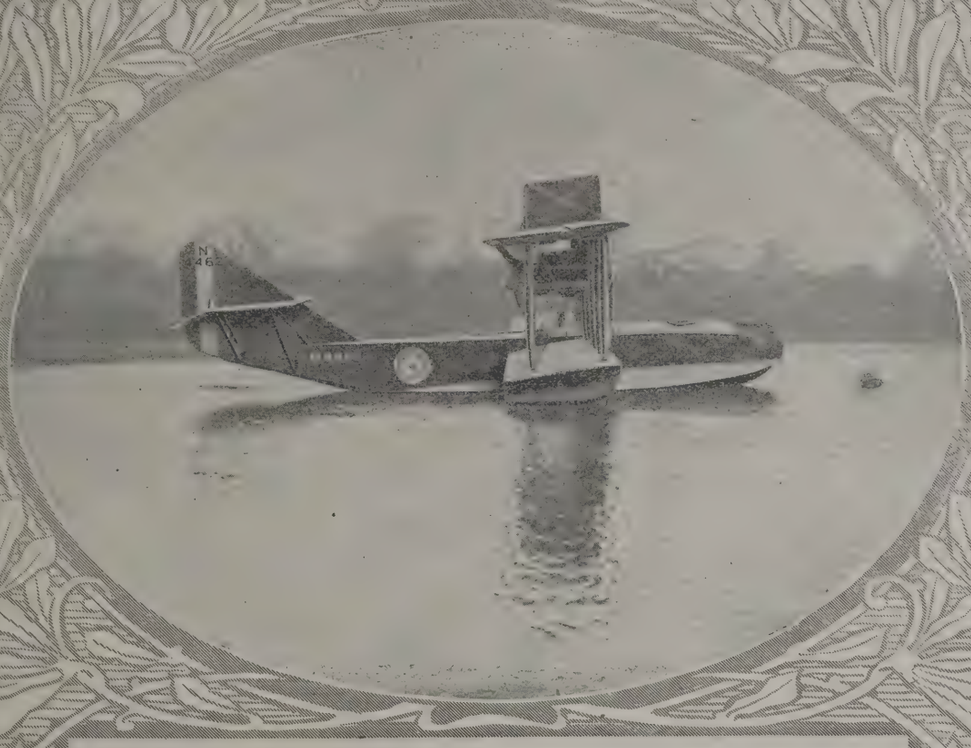
4. It is also possible that the Government would be prepared to share or undertake all the financial risk of the insurance of the airships until the security of the service was so established as to warrant underwriters giving reasonable rates.



It is understood that the German Airship Passenger Company, which was run by the Hamburg-America Steamship Company, was subsidised by the German Government to the extent of being provided with crews and handling parties of the Army and Navy Airship Services under training.

SECTION VII.

General Specifications of Proposed Airship for Transport Services.



General particulars :—

Gross gas capacity	3,500,000 cubic feet
Overall length	800 feet
Maximum diameter and overall width	100 feet
Overall height	105 feet
Total lift (at 68 lbs. per 1,000 cubic feet)	105 tons
Disposable lift	68 tons
Total maximum power of engines	3,500 B.H.P
Cruising power	2,000 B.H.P.
Speed at full power	75 m.p.h
Speed at cruising power	60 m.p.h
Endurance at cruising power—when carrying 15 tons of passengers and freight	80 hours, equals 4,800 miles

Diagrams of the Passenger accommodation of the Vickers proposed Trans-Atlantic Airships.

EAST COWES, I.O.W.

SBAC — THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS

Endurance at cruising power—when carrying
10 tons of passengers and freight .....
90 hours, equals 5,400 miles

Note.—The "Disposable Lift" is the lift available for fuel and oil, stores, crew and passengers, mails, and freight, etc.

The particulars and performance stated are based on present design, and the actual performance of ships of 2,000,000 cubic feet capacity now in service. It is considered that the figures given are conservative and that actually the increased size of ship would enable greater structural efficiency and consequently greater disposable lift available than that specified.

Special Features:

Passenger accommodation—

Living Saloon.—The main living accommodation would be in a saloon fitted along the top of the airship, provided with tables and chairs in the style of a Pullman car, which would enable the passengers to be comfortably accommodated during the day time. Part of this saloon would be fire-proofed to allow of being used as a smoke room. An open shelter deck would also be provided at the aft end to enable the passengers to take the air.

The saloons would be provided with windows giving the passengers an all-round outlook.

A passenger lift would be provided for communication between the passengers' quarters and the lower part of the ship.

Observation car.—An observation car, fitted below the hull towards the aft end of the airship, would also enable passengers to observe the land and sea immediately below the ship.

Sleeping quarters.—Sleeping accommodation in the form of berths would be provided in small cabins fitted on top of the airship forward of the living saloons.

Cooking.—A mess kitchen would be provided fitted with electrical cooking apparatus. Meals would be served in the saloon.

Heating.—The saloons and sleeping quarters would be heated by electric radiators.

Height equilibrium:—

On long day and night flights the greatest problem is the maintenance of the airship at a constant height, and avoiding the loss of gas consequent on expansion due to the ship rising as she loses weight by consumption of engine fuel. Also, owing to the great variation in temperature between day and night, the ship becomes heavy due to the lower temperature at night, and light due to the higher day temperature, and thus would require a discharge of weight (ballast) at nightfall, and discharge of gas in the morning to keep the ship in equilibrium. To obviate discharge of gas, and the necessity of starting with a large weight of ballast, it is proposed to adopt the following means:—

1. Using hydrogen as fuel.—Arrangements may be made to run a proportion of the engines on gas fuel, so the gas can be consumed at such a rate that the loss of lift equals the loss of weight of fuel consumed by the other engines, thus economically using gas which otherwise would be lost through the discharge of the gas-valves. For details of this scheme, see the appendix to this section, from which it will be seen that hydrogen as fuel is only approximately twice the cost of petrol.

2. Water recovery from exhaust gases.—Apparatus could be provided to condense the water of combustion from the exhaust gases of the engines. Experiments which have been carried out have demonstrated that it is practicable to recover water of slightly greater weight than the petrol fuel consumed, thus avoiding any variation in lift due to petrol consumption.

3. Water ballast from the sea.—Apparatus could be provided to enable water ballast to be picked up periodically from the sea by means of a pump suspended from a flexible hose, or by bringing the airship down on to the water's surface and taking water direct into tanks in the gondolas through sea-valves.

4. Dynamic lift. If the airship is flown with a slight upwards or downwards inclination, a considerable lifting or weight effect is obtained, but this, however, entails a reduction in the flying speed of the ship.

General Specification.

Hull Structure.—The shape of the hull to be of the most perfect streamline form within the limitations of constructional requirements.

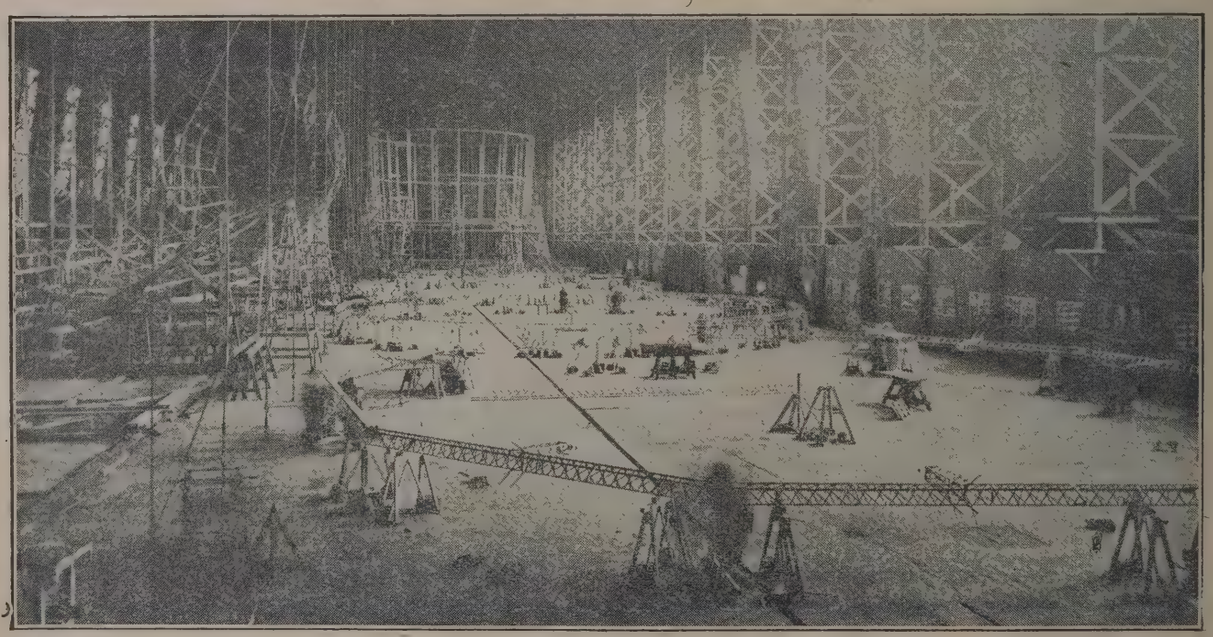
An internal keel corridor, running along the bottom of the hull, to be provided, in which all petrol and oil tanks and water ballast would be carried.

Outer Covering.—The outer cover would be made of special weather-proof fabric to give the longest possible life when subjected to the weather effects on continuous voyages. Also, to be as efficient as possible in insulating the gas from change of temperature, and so avoid great variations in the lift.

Gasbags.—The gas capacity would be divided up into gasbags made of suitable rubber-proofed cotton fabric, lined with goldbeater's skins. Gasbags will be fitted to automatic relief valves and hand control manœuvring valves.

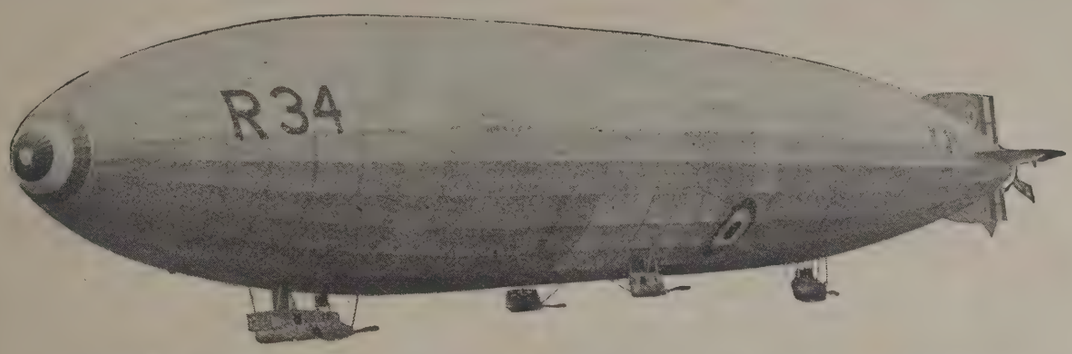
Control and Navigating Compartment.—A control and navigating compartment to be built on to the hull towards the forward end of the airship, which would contain all main controls, the navigating instruments, and also the wireless telegraphy installation cabin.

This compartment should be so arranged with windows as to have a clear view in every direction.



Machinery Cars.—Six machinery cars would be fitted, each containing one engine installation, with a direct-driven propeller fitted at the aft end. Two of these cars to be suspended on each side of the hull, suitably arranged so as to give ample ground clearance for the propellers.

The two other cars to be situated underneath the hull, and fitted with landing gear and floats.

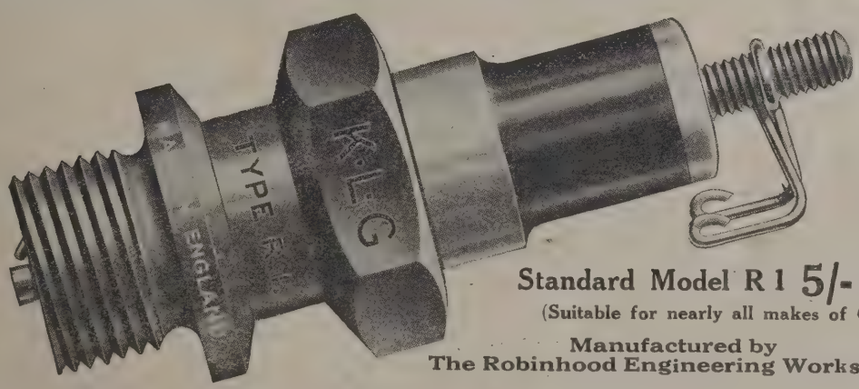


Machinery Arrangements:—

Six engines, of a nominal 600 b.h.p. each, to be fitted, making a maximum total power of 3,500 b.h.p. The engines to be designed to develop their maximum full power when flying at a height of 5,000 feet.

Engine Starting.—Starting to be by the Maybach charging pump system, or, alternatively, the engine to be arranged to start on the hydrogen fuel.

AT THE VICKERS WORKS:—Transverse frame rings for rigid Airships being assembled. In the background may be seen a section of the hull being erected in a vertical position, and on the left a completed section on the assembling cradles.



ANOTHER GREAT TRIUMPH for K.L.G. Plugs

Fitted on the "Sunbeam-Coatalen" engines of the R.34 in her great Victory flight over the Atlantic, "K.L.G." Plugs gave every possible satisfaction and largely contributed to the success of the voyage out and home.

It is a noteworthy fact that "K.L.G." Plugs were used on all British Machines flying the Atlantic—first on the Sopwith (Hawker-Grieve) machine, then on the Vickers-Vimy (Alcock-Brown) Machine and on the British Airship R.34

All were available, "K.L.G." were chosen.

Standard Model R 1 5/- each
(Suitable for nearly all makes of Cars)
Manufactured by
The Robinhood Engineering Works, Ltd.

K.L.G. Plugs are the proved efficient Plugs for all makes and types of engines for Motor Cars, Motor Cycles, Commercial Vehicles, Aeroplanes and Airships.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

Reversing Gear.—The transmission gear in two of the wing cars only, to be fitted with reversing gear to enable the airship to be driven astern.

Cooling System.—The radiators of the engine-cooling system to be fitted in slides to enable them to be completely drawn into the cars when the engines are not running, to ensure their being kept sufficiently warm and prevent freezing.

Silencer.—The engines to be fitted with special exhaust silencers in order to reduce the exhaust noise to a minimum, and special consideration is also to be given in the design of the transmission gear, etc., to obviate as far as possible all objectionable noise.

Engine Fuel.—All engines to be designed for running on petrol fuel, but to be fitted with arrangements to enable them to be run alternatively on hydrogen gas

Controls and Communications.—All the following controls of improved type would be fitted, to be operated from the forward control compartment :—

(i) Controls to the rudders and elevator planes for the steering control.

(ii) Gas-valve Controls.—Control gear to be fitted to enable the gas discharge valves on a selected number of gasbags to be operated from the control compartment.

(iii) Ballast Discharge Control.—Controls would be fitted to enable all the emergency water ballast discharge to be controlled from the forward compartment, all other water ballast to be discharged by local control.

(iv) Engine-room Telegraphs.—Engine-room telegraphs, preferably of the electrical type, would be fitted for communication from the forward compartment to the machinery cars.

(v) Telephones.—Telephone communication would be provided between all stations on the ship.

Heating Arrangements.—The living quarters and the control compartment would be heated by electric radiators.

In the machinery cars arrangements would be made to utilise the exhaust heat for keeping the cars at the necessary temperature.

Landing Gear.—Inflated buffer landing bags of a special type would be fitted underneath the forward control compartment, and underneath the two aft machinery cars, which would enable the airship to alight either on land or on the surface of the sea.

Mooring and Handling Gear.—Hauling-down ropes, mooring ropes, and sea anchor gear would be provided as necessary in connection with the mechanical handling and mooring-out arrangements.

The airship would be provided with bow mooring gear to enable her to be moored out to the mooring tower.

Special means of mechanically handling the airship when landing, and for taking her into the shed, would be provided on the landing grounds, and the necessary attachments in connection with this provided on the ship. These arrangements would be of such a nature as to reduce the number of hands required during these operations to the personnel usefully employed at the shed establishment.

For full description of proposed methods of handling and mooring the airship, see Section VIII.

Electrical Installation.—Electrical power would be provided by dynamos driven off the main engines to provide current for electric lighting of the saloons and cars, and also to provide the electrical heating in the saloon cabin and sleeping quarters.

Wireless Telegraphy.—A powerful wireless telegraphy installation would be fitted in the wireless cabin in the forward control compartment, and would have a range for sending and receiving of at least 5,000 miles.

SECTION VIII.

Aerodromes, Sheds, and Equipment.

At the terminal point of each airship route it would be necessary to make provision for the following :—

1. An aerodrome of about one mile square.
2. A double airship shed capable of housing two of the airships.
3. A mooring-out tower, with bow mooring gear
4. Mechanical handling gear for transferring the airship from the mooring tower to the shed.
5. Hydrogen generating plant and storage.
6. Repair workshops and stores.
7. Meteorological office and wireless telegraphy installation.
8. Electrical night signalling and lighting arrangements for the aerodrome.
9. Offices, etc.

Aerodrome.—The aerodromes should be within direct communication and a short distance from the city served by the airship service, and, if possible, would be advantageously situated near to a chemical works where hydrogen could be obtained as a by-product.

The ground would require to be flat, and preferably on a site remote from hills and other topographical features likely to cause air disturbances

Sheds.—The double sheds required to house the size of airships specified would require to have two berths each with a minimum size of 850 ft. long, 150 ft. wide, and 115 ft. high, with opening doors.

The sheds would be provided with hydrogen-filling mains and with gear for slinging the airships from the roof when deflated for overhaul.

Special arrangements would be made to enable rapid replenishing of the ships with gas, fuel, and water ballast

Mooring-out arrangements (see below).—A mooring-out station would be provided at each aerodrome, consisting of a fixed mooring tower about 150 ft. in height, with a revolving head to which the airship would be rigidly attached by the nose and would ride clear of the ground in all weathers, and be able to turn round in accordance with the direction of the wind. This tower would be provided with a hauling-in winch and rope to haul the ship up to the mooring point.

Means would be provided at this mooring tower to enable the airship to be supplied with hydrogen, fuel, and water ballast whilst moored out.

A lift from the ground to the top of the tower would enable passengers to embark and disembark whilst the airship was riding at the mooring, and would also serve to convey mails, freight, stores, etc., to the ship.

The airship would be moored to this mast and ride out during even the worst weather, and would only require to be taken into the shed when lying up and for overhaul and repairs, etc.

A diagrammatic sketch showing the scheme of mooring the ship to the mooring mast is shown in the figure below.

Mechanical Handling Gear.—Mechanical handling gear, consisting of trolleys running on guide rails from the mooring tower to the shed, with electrically-driven gear, would enable the ship

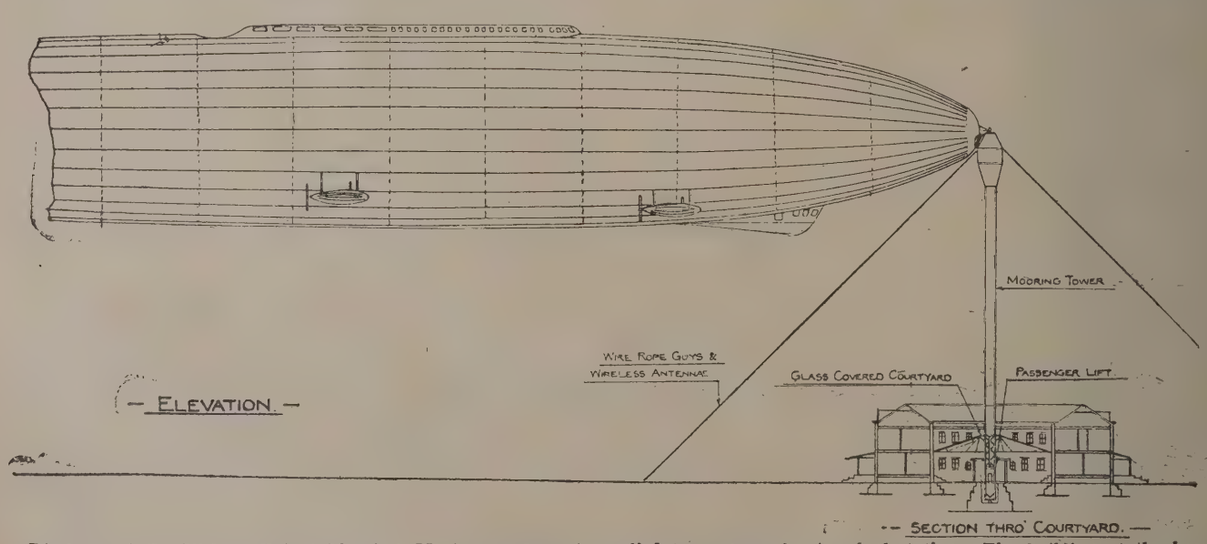

Diagram of the Vickers Patent Mooring Mast arrangement applied to a passenger terminal station. The building at the base of the mast is the Station Hotel.

to be safely moved from the mooring tower to the shed with a minimum of man power.

Hydrogen Generating Plant and Storage.—If no industrial supply of hydrogen were conveniently situated, it would be necessary to provide each aerodrome with hydrogen generating plant, with a production of, say, 50,000 cubic feet per hour, and gasometer storage would require to be provided with a capacity of about 500,000 cubic feet.

Workshops and Stores.—Workshops would be provided at the shed as necessary to carry out all overhauls and repairs to the airships, and stores would require to be provided to store spare gear and other materials required.

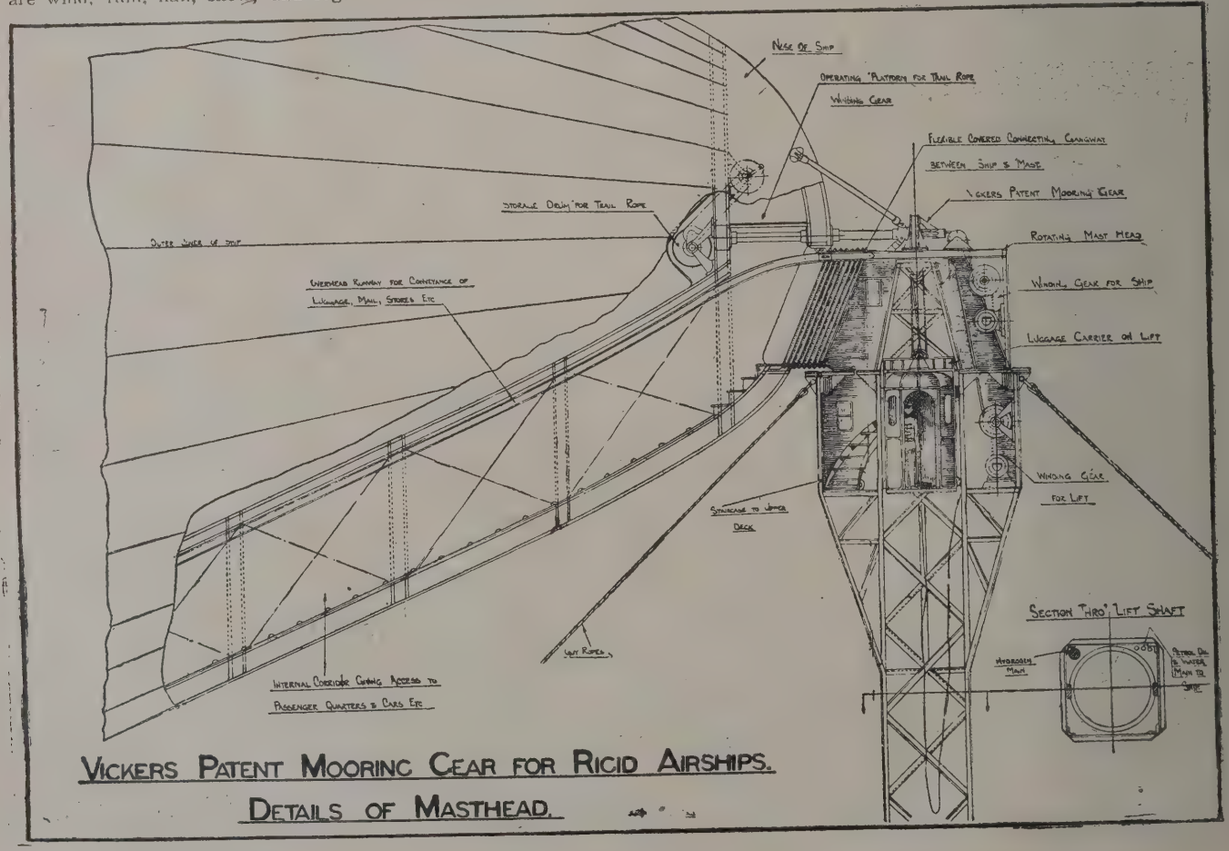
Meteorological Office and Wireless Installation.—Each aerodrome would be provided with a meteorological office or station to issue weather reports for the guidance of airship navigators and to issue navigating instructions to them whilst on voyage by means of the wireless installation. The latter would require to have a range of at least 5,000 miles.

Electrical Night Signals and Lighting Arrangements.—Each aerodrome would be provided with suitable electric light sky signals to indicate the position of the landing ground to incoming ships at night, and the aerodrome would require to be provided with landing lights to indicate the position of the mooring tower and to give sufficient light to enable the ship to be moored.

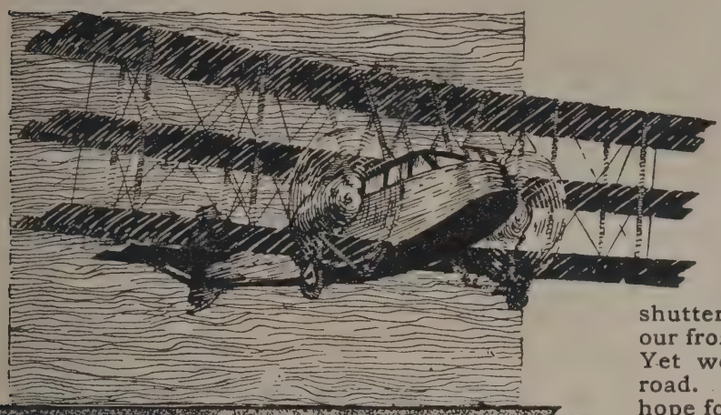
SECTION IX.

The Weather as Affecting Airship Service.

The elements of weather that have influence on airship travel are wind, rain, hail, snow, and fog.



It is not likely that rain, hail, snow, and fog will of themselves have much influence on airship flying. With suitable rainproof, non-absorbent outer covering, the absorption of water, and the consequent increase of weight, are avoided. Hail and snow will not adhere to the ship's surface when in flight owing to the high speed through the air, and in any case, as the precipitation height is not usually more than 8,000 feet, they can be entirely avoided by flying above this height.



Fog might give trouble in landing, but in flight the airship would be above the fog, and not be affected by it. In landing, suitable means would be taken to mark the landing place by means of captive balloons or kites, and strong searchlights could be used on the ground. At night the balloons would carry electric lights with connection from the ground.

Rain, hail, snow, and fog are also generally local in their occurrence, and could, in any case, generally be avoided by a short deviation from route. Cross-Atlantic records indicate that on the main steamship routes fog sufficient to impede navigation does not occur on more than 12 days in the year.

Wind.—The only important factor that need be taken into consideration is wind, but in most cases unduly strong winds can be avoided by flying at a higher level or sailing on a different course, so as to avoid the storm area.

As is well known, there are at sea level, between certain clearly defined latitudes, prevailing winds of constant direction, of which advantage can be taken by suitably laying out the course and route to be followed. Again, at the higher levels, there is at most latitudes a constant drift, of which advantage may be taken even if the winds at sea level are unfavourable.

TRANSITIONS IN TRANSIT

No. 2. **The Royal Mail Stage Coach.**

One hundred years ago: and a sharp chill morning.

The post boy ups and sounds a shrill "Tantivy" as we rumble into the town. Clattering hoofs echo from shuttered houses, striking further chill to our frozen senses. Most folk are still abed. Yet we are already twenty miles on our road. Thirty more must go before we can hope for something hot and steaming (with a dash of lemon in it). Even the thought of *that* fails to warm our numbed extremities.

Passengers outside chilled to the marrow. Passengers inside petulantly declaiming the frowsy stuffiness of life generally. One and all heartily sick of the whole business.

From York to London in 3 days! And nowadays the same journey can be done in comfort in 3 hours—by aeroplane.

Illustrated above is the Nieuport 12-seater passenger machine.

Telephone: WILLESDEN 2455 (3 lines).

Telegrams: "NIEUSCOUT, CRICKLE, LONDON."

OFFICES & WORKS:
CRICKLEWOOD,
LONDON,
N.W.2

The following general facts, which have been established from meteorological records all over the world, have a great bearing on airship possibilities—viz., (1) heavy storms, which are usually of a cyclonic nature, are known rarely to cover an area of more than 200 miles diameter; (2) the rate of progression of a cyclonic area is considerably less than the speed of the air movement in the area.

It is therefore obvious from the above that an airship would get clear of a cyclonic area by a deviation from her route of not more than 100 miles, and once clear of the disturbed area would have no difficulty in getting and keeping away from it.

Prevailing Winds at Sea Level in the North Atlantic.—The prevailing winds north of the Equator may be clearly divided into two regions:—

1. Between that part of the West Coast of Africa between latitudes 30° N. and 15° N., and the American coast from Florida to the Amazon.

In this region the winds at the African coast blow from N.E. by N., and gradually become more easterly across the Atlantic, until at the American coast they are practically N.E. at the Amazon, and practically E. at the Mexican Gulf.

These winds are the trade winds of the old navigators, and are remarkable for their steadiness and persistency, both as regards direction and speed.

The speed of these winds averages 10 to 15 miles per hour, and varies little from season to season.

These winds are favourable for flying from east to west.

2. Between the coast of the United States from Florida and as far north as Newfoundland to Europe, from the North Coast of Spain to the North of Scotland.

In this region at the American coast the prevailing winds blow from almost due W. in the winter months, veering S.W. in the summer months, and gradually change in crossing the Atlantic to S.W. on the European coast in winter and almost due W. in summer.

These winds are more variable than the trade winds, but are persistently westerly. Their speed is, however, more variable.

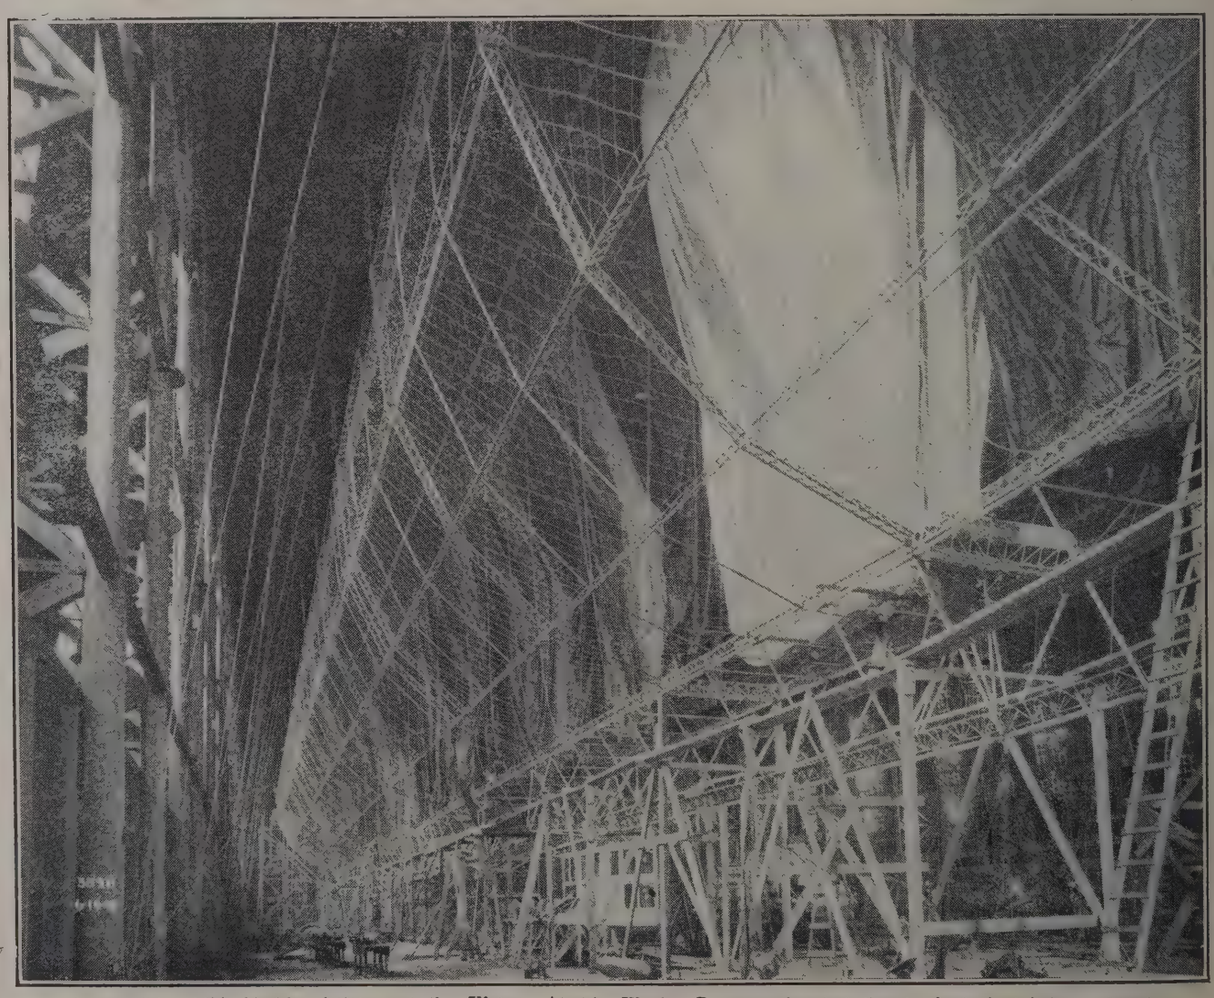
The yearly average of the speed of these winds is 15 miles per hour, but they occasionally blow up to 40 miles per hour, and heavy gales are not unknown in the winter months, but these are usually of a local character.

Records kept on the main Atlantic steamship routes indicate that, on the average, general winds of 40 m.p.h. and over do not occur on more than 20 days per annum, and the total time of duration not more than 300 hours in all.

Practically all the storms of 40 m.p.h. and over occur N. of latitude 45° N.—that is, the latitude Bordeaux-Nova Scotia; and 60 per cent. of the total number of storms in the winter months (November, December, and January), only less than 10 per cent. in the summer months (May to August).

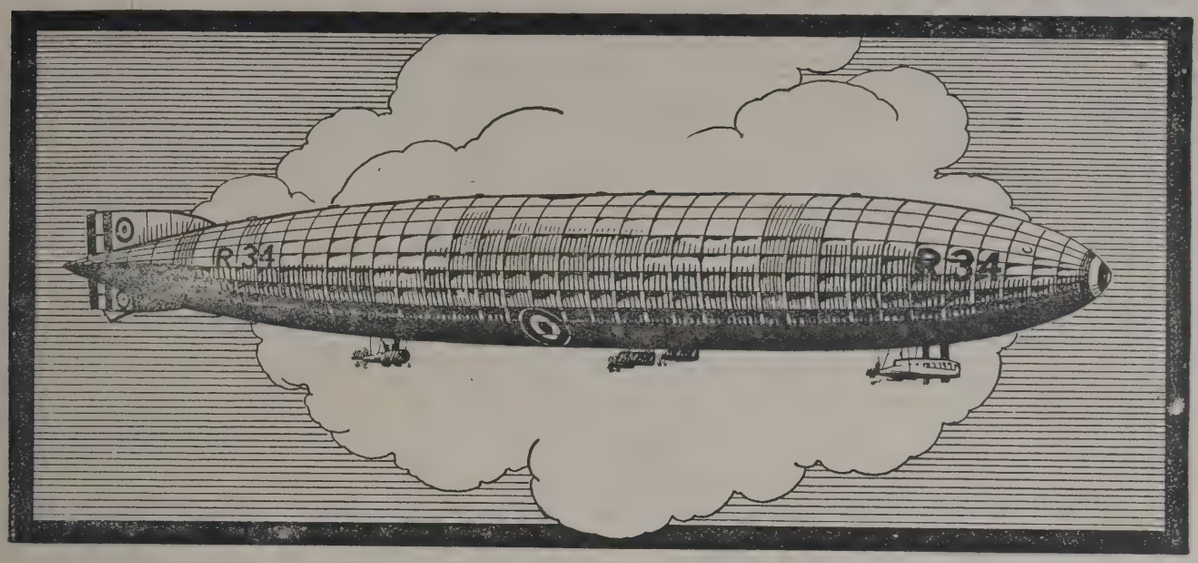
Prevailing Winds at Higher Levels.—Although, as stated above, precise information is available of the sea-level prevailing and periodic winds at various latitudes, very little co-ordinated work appears to have been done in charting the prevailing and seasonal winds in the higher levels of the atmosphere. A great deal of work has been done in various localities in U.S.A., England, and Germany, but very little is known of the winds at the higher levels over the great ocean tracts.

There is no doubt a great necessity for international research on the predictions of weather conditions in the higher atmosphere, to enable advantage to be taken of these higher currents, if Atlantic flying is to become as common as Channel flying.



At high altitudes, constant winds of from 30 to 40 m.p.h. are common, and if the prevailing directions of these are known to airship navigators the duration of the journey could be considerably shortened, even by taking an indirect route, if advantage can be taken of these air currents.

It is, however, undesirable to fly at great heights owing to the low temperature, but with suitable provision for heating there is no reason why flying at 10,000 feet should not be common.



SECTION X.

Airship Navigation.

The navigation of airships is similar in principle to that of steamships, but is made more difficult by much greater drift to be allowed for.

A complete rigid Airship skeleton at the Vickers Airship Works, Barrow, showing the gas-bags just being inflated.

SUNBEAM-COATALEN AIRCRAFT ENGINES

are fitted to H.M.A. R.34

The wonderful achievement of R.34 in making the double journey across the Atlantic affords ample proof of the efficiency of Sunbeam-Coatalen Aircraft engines and machinery. This was no single flight of a few hours' duration, but a voyage of 183 hours. Never before have any aircraft engines had to withstand such continuous strain.

Having twice crossed the Atlantic, made numerous patrols and trials, and journeyed from end to end of Germany, R.34 has travelled a distance roughly equal to 15,000 miles or 300 hours' actual flying —every performance on SUNBEAM-COATALEN Aircraft Engines.

The SUNBEAM MOTOR CAR Co., Ltd.,
Contractors to War Office, Admiralty and Air Ministry,
WOLVERHAMPTON, ENGLAND.

The actual course of a ship being the resultant of its own forward speed and that of the motion of the air in which it is borne, it is impossible for the navigator to plot his true course relative to the earth unless he is aware of the motion of the air.

When navigating over land he is able to determine the drift of his ship by observation of a suitable fixed point on the earth's surface and adjust his compass course accordingly to give the desired true course.

Over sea, of course, no fixed point is available, so if the motion of the wind is not known, the course must be periodically corrected by astronomical observation, and determination of his charted position.

A reliable and effective method of navigation is, however, available with the wireless installation.

If the ship is in communication with two stations, they can determine the direction of the transmitted waves and signal to the ship its bearings, from which the position can be laid off on the ship's chart and the new departure determined.

It is known that this method of direction was used by the German Naval Zeppelin airships.

SECTION XI.

Comparison of Airships and Aeroplanes for Long-Distance Transport.

Endurance.—The airship of 3,500,000 cubic feet capacity, specified in this paper for immediate use for trans-Atlantic transport, has an endurance of 80 hours at an air speed of 60 m.p.h., and can carry 15 tons of passengers and mails for an air distance of 4,800 miles at that speed. Also, it would be quite a practicable proposition with present systems of design and materials of construction to build a rigid airship to carry 50 tons of passengers and freight for 10,000 miles, at a speed of 80 m.p.h., as soon as developments in the demand for aerial transport justify the construction of the size of airship necessary.

With a 40-ton all-metal aeroplane—which represents about the maximum size and most efficient weight-carrying type that could at present be constructed and handled—the maximum non-stop endurance of this machine would not be greater than 25 hours, carrying a load of passengers and mails of about three tons, at an air speed of 85 m.p.h.—i.e., having a maximum air distance of 2,100 miles; and unless some radical new method of design is discovered, it is considered theoretically impossible to produce a machine on the present methods of construction, even with light metal structure throughout, to give an effective range of more than 2,000 miles, and then only with a relatively very small passenger load-carrying capacity.

The advantage of the airship in these respects is due to the following characteristics. In the case of the airship the percentage of useful lift increases with the size of ship and the rate to power ratio decreases.

In the case of the aeroplane the percentage of useful lift and the weight to power ratio increases but slightly with increase of size.

It therefore may be definitely accepted that for voyages on which it is necessary to make a non-stop flight between points more than 2,000 miles distant the airship is far more economical, and, further, is the only means of aerial transport practicable.

On the other hand, if flying over land, with landing grounds provided at intervals of not more than 1,000 miles, the aeroplane can of course travel for indefinite distances, coming down at each landing ground for replenishment of fuel and oil.

It therefore appears inevitable that the airship will hold the field for long-distance cross-oceanic voyages and the aeroplane will be used for routes which may be flown in stages of a maximum distance apart of about 1,000 miles continuous flight.

Carrying this delimitation further, it may be concluded that the airship may be used to deal with express traffic at present dealt with by trans-oceanic liners, and the aeroplane will deal with local traffic and express traffic at present dealt with by railway trains and cross-Channel steamers.

Comfort of Travel.—With the large space available on a large rigid airship, it is quite easy to provide comfortable living and sleeping accommodation for the passengers, as described in the specification of the airship in Section VII.

It is obvious that in the restricted space available on an aeroplane it is impossible to provide the same comfort and convenience for the passengers as can be provided in the large airship.

Further, on the airship, there is plenty of room for the passengers to move about and take exercise by walking along the length of the inside keel or inside the top saloon of the airship, and the preparation and eating of adequate meals in comfort is easily provided for, but in an aeroplane the passengers will be restricted to a very confined space.

A great advantage in comfort in travelling on an airship is attained by the comparative silence and lack of vibration due to the ship's machinery, and it is probable that in the saloon at the top of the vessel, which is remote from the engines and propellers, there will be absolute silence. On an aeroplane, on the other hand, the passengers have unavoidably to be accommodated close to the engines and propellers, and the noise will be a very serious objection.

Safety.—An aeroplane is entirely dependent on the proper working of the engines for its sustentation in the air, and should any of the engines break down, the result would be a forced landing on the water, with the consequent possibility of total loss on a rough sea.

In the case of an airship the only result of the breaking-down of any of the motors is the reduction in the speed, and as a speed of 0.8 full speed can still be maintained with even half of the motors out of action, there is no possibility of the airship being lost owing to possible failure of the engines alone. The only result would be that the arrival of the airship would be somewhat delayed owing to the reduction in speed.

It may further be stated that with reduced power, petrol consumption per mile run is considerably reduced, and the airship would then have an even greater reserve of endurance.

It may further be noted that on an airship the machinery can be so arranged as to be perfectly accessible for repairs or replacements of the engines whilst en route, and as the ship can be driven by the other engines no stoppage need be incurred for this purpose.

Speed.—The large type of aeroplane which will be necessary to carry an economical load for long distances will not have a speed greater than 85 to 90 m.p.h., and if it is taken into account that for long journeys an aeroplane requires to stop at a number of intermediate landing grounds for replenishment, it is apparent that the advantage of the aeroplane speed of 85 m.p.h. over the airship speed of 60 m.p.h. will not be very apparent, if any at all, and any slight advantage which there may be in this respect will disappear when the large type of airship is used, which can easily have a cruising speed of 75 to 80 m.p.h.

For the airship service, London to New York direct, the time is 50 hours; and with the aeroplane service, London-Ireland-Newfoundland-New York, the time taken is at least 46 hours, and it is probable that in service the times would be about the same.

Cost of Service.—As a basis of comparison of cost of operation of comparative trans-Atlantic services by airship and aeroplane, it has been assumed that there will be a constant average traffic of 30 tons total load of passengers, mails, or freight required to be transported each direction per week, and that both services are run to meet this demand.

The estimate of the cost of airship service is given in Section V and aeroplane service in Section XII. The results may be compared as follows:—

	Airship Service.	Aeroplane Service.
Capital required	£2,600,000 ...	£3,850,000
Passenger rate:—		
London-New York	£48 ...	£115
Rate per passenger mile...	4d. ...	9d.
Mails per ounce:—		
London-New York	3d. ...	7½d.

SECTION XII.

Comparative Aeroplane Trans-Atlantic Service.

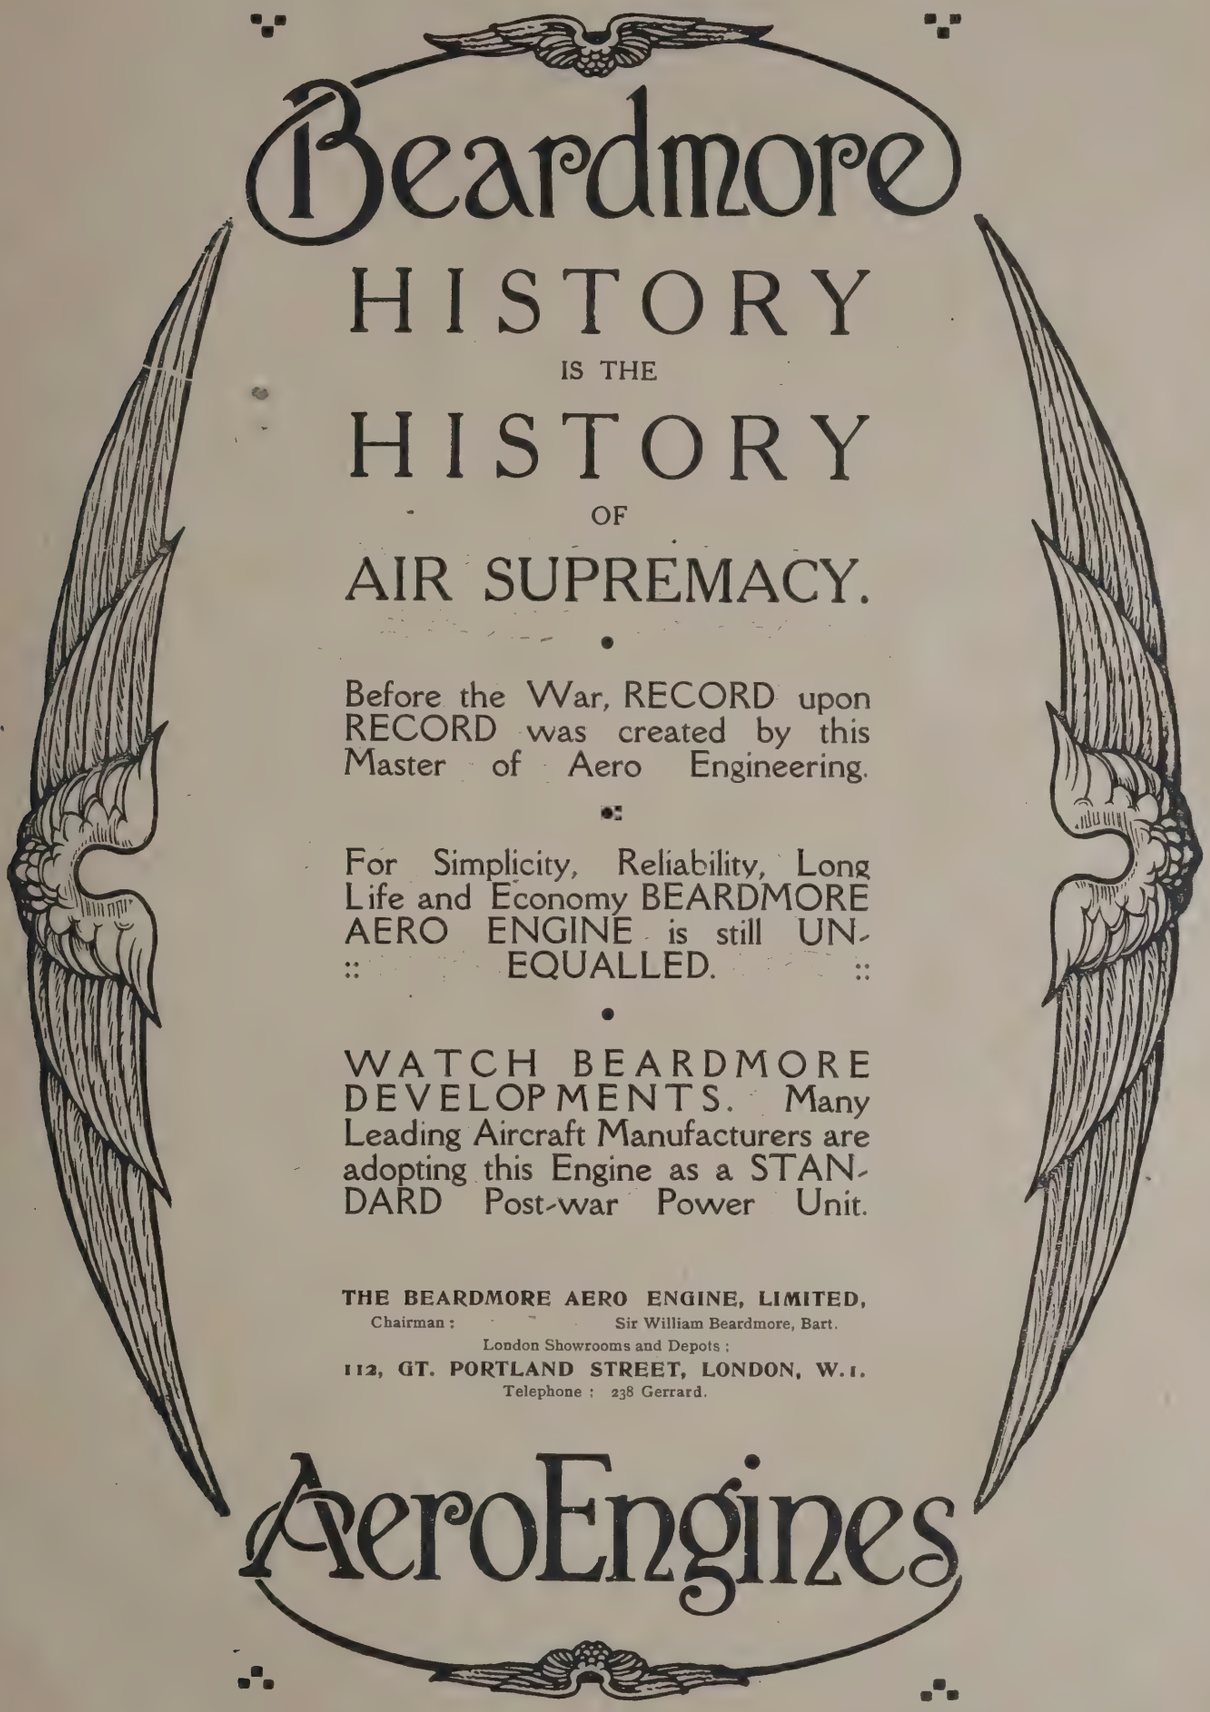
Route.—There is not an aeroplane in existence capable of flying direct the 3,000 miles between London and New York, even when loaded only with the necessary pilots and crew, and 2,000 miles continuous flight represents the maximum that can be done by any existing aeroplane with crew only.

It is also very improbable that a machine of even 50 tons total load, of the most efficient type with the lightest possible metal structure, will be able to fly more than 2,500 air miles with even a small number of passengers and freight.

It therefore must be recognised that safe direct trans-oceanic commercial flying between points more than 2,000 miles apart by aeroplane is an impossibility, unless some entirely radical new principle of design is evolved.

In order to make the Atlantic crossing by aeroplane it will therefore be necessary to take a route allowing of intermediate landing-places for replenishment of fuel, etc., with the consequent delays and necessity of additional aerodromes and equipment.

The alternative routes are:—



1. London-Ireland-Newfoundland-New York, the longest distance being 1,800 miles between Ireland and Newfoundland, and the total distance = 3,200 miles.

2. London-Azores-Newfoundland-New York. The longest distance is 1,300 miles between the Azores and Newfoundland, and the total distance = 3,600 miles.

It would be possible to fly by the second route with the largest and most efficient aeroplanes now in service, but only with a very small number of passengers

In order to compare the aeroplane with the airship proposed for cross-Atlantic service, we shall consider a large machine which represents the limit of possible developments in size and efficiency at present considered attainable.

There are obvious disadvantages in using the London-Azores-Newfoundland route for regular commercial service. It would

Beardmore

HISTORY

IS THE

HISTORY

OF

AIR SUPREMACY.

Before the War, RECORD upon RECORD was created by this Master of Aero Engineering.

For Simplicity, Reliability, Long Life and Economy BEARDMORE AERO ENGINE is still UNEQUALLED.

WATCH BEARDMORE DEVELOPMENTS. Many Leading Aircraft Manufacturers are adopting this Engine as a STANDARD Post-war Power Unit.

AeroEngines

C.D C.

be difficult to navigate an aeroplane in stormy weather and at night to ensure landing on the relatively small Azore islands, and there would be great danger of the reserve petrol being consumed before being able to strike the islands, and being forced to alight on the sea. There are also objections to having to make two landings during the voyage owing to the loss of time in landing and getting away again, but with an aeroplane this is unavoidable. It is therefore considered that the only practical route for regular use is the London-Ireland-Newfoundland route, and we shall therefore, for comparison with the airship, consider a machine large enough to carry a commercial load on this route :—

Minimum direct distance .....1,800 miles
To give a safety reserve of 25 per cent., the machine must carry fuel and oil for .....2,250 miles

This would allow of flying against an average head wind of 15 m.p.h. for the whole distance.

Particulars of Machine required :—

Total load .....40 tons (90,000 lbs.)
Useful lift (fuel, oil, passengers, etc.) .....20 tons (45,000 lbs.)
Maximum b.h.p. .....4,000 b.h.p.
Maximum speed flying at 5,000 ft. .....85 m.p.h.
Fuel consumption .....0.45 lbs. per b.h.p./hour
Oil consumption .....0.03 lbs. per b.h.p./hour

Assuming that the power is reduced, and engines cut out so as to maintain a constant load/power ratio, as weight is reduced by consumption of fuel, the weight of fuel and oil required for 2,250 miles (26.5 hours at 85 m.p.h.) .....39,000 lbs.
This leaves for passengers and crew .....6,000 lbs.

Crew Required.—Three pilots, three engineers, taking watches of four hours on and eight hours off; one steward; total crew, seven men.

Weight at 160 lbs. per man, personal effects at 20 lbs. per man, food at 10 lbs. per man; total, $190 \times 7 = 1,330$ lbs. This leaves for passengers, mails, etc., 4,670 lbs. = 2.1 tons.

Passenger weight at 170 lbs. per man, personal baggage at 50 lbs. per man, food, etc., at 15 lbs. per man; total 235 lbs. per man. Number of passengers that can be carried, 20.

Service :—

Time taken for crossing :—

London-Ireland .....300 miles = 3½ hours
Ireland-Newfoundland .....1,800 miles = 21½ hours
Newfoundland-New York .....1,100 miles = 13 hours
Total time in air .....38 hours

Allowing two hours at the Ireland Station and six hours at Newfoundland for landing, refilling, and getting away, the total time for the journey would be forty-six hours.

It would therefore, allowing time for overhaul, etc., be possible for a machine to make two crossings per week.

Thus, to give the same service as the airship service proposed, i.e., 30 tons of passengers and mails each way per week, 14 aeroplanes continually in service would be required; and allowing for 100 per cent. spare machines stand-by for repairs, and overhaul, total number of machines required—28.

Cost of running the service :—

The cost of running the service would be that necessary to cover the following charges, viz. : (1) Interest on capital required; (2) Allowances for depreciation; (3) Insurance premiums; (4) Operating expenses; (5) Repairs and maintenance.

1. Capital charges :—

28 aeroplanes at £120,000 each	£3,350,000
28 aeroplane sheds at £10,000 each	280,000
Land for 4 aerodromes	100,000
Workships and equipments	20,000
Spare parts, etc.	100,000
Wireless equipment	10,000
	£3,860,000
Total capital required	£3,860,000
Annual charge at 10 per cent. interest	£386,000

2. Depreciation :—

(a) Aeroplanes.—Useful life say 3 years as for airships; Obsolete value, say £6,000 per machine; Average total depreciation per annum for 28 machines, equal £1,050,000.

(b) Aeroplane sheds.—Life say 20 years; Scrap value in 20 years—10 per cent. Total annual charge—£12,200.

(c) Workshops and plant.—Depreciation at 3 per cent. per annum—£600.

(d) Land for sheds and aerodromes.—Would not decrease in value.

Total annual charge for depreciation—£1,062,800.

3. Insurance premiums :—

(a) On aeroplane value at 10 per cent. per annum—£225,000.
(b) On sheds and plant at 2 per cent. per annum—£5,400.
Total insurance charges—£230,400.

4. Annual establishment expenses :—

(a) Salaries of 36 pilots at £600 per annum—£21,600; Salaries of 36 engineers at £400 per annum—£14,400; Salaries of 12 stewards at £300 per annum—£3,600.
(b) Salaries of establishment :—
(i) Management and staff—£5,000.
(ii) Workshop hands and storekeepers, etc., at 100 off.—£20,000.
Total annual establishment expenses—£64,600.

5. Repairs and maintenance :—

(a) Sheds and plant, annual charge, say—£5,000.
(b) Repairs and overhaul to machines—£10,000. Total £15,000.

Totals of annual charges :—

1. Interest on capital—£386,000.
2. Depreciation—£1,062,800.
3. Insurance—£230,400.
4. Establishment expenses—£64,600.
5. Repairs and maintenance—£15,000. Total £1,758,800.

Cost chargeable per crossing :—

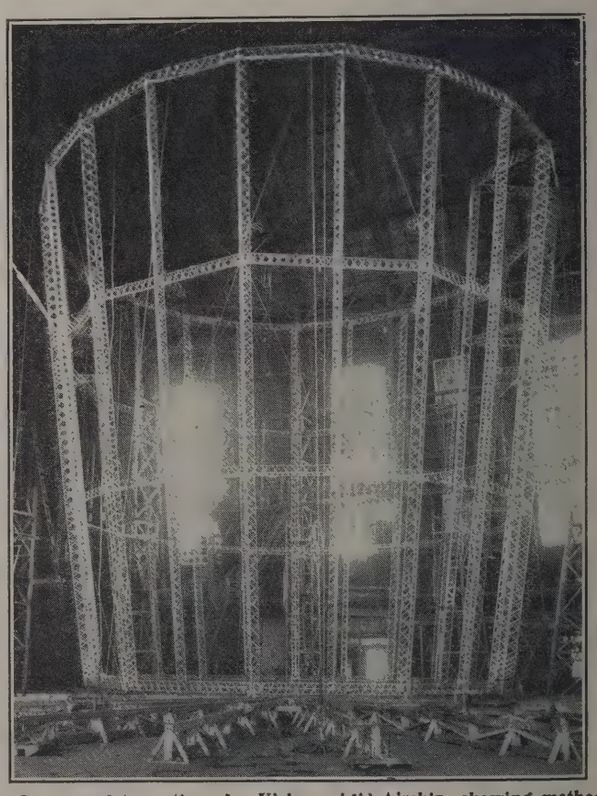
1. Proportion of annual charges.
2. Cost of fuel and oil per crossing.
3. Cost of Food, etc.

As aeroplanes may be taken as being practically independent of weather it is assumed that the service of twenty-four crossings per week is maintained for fifty weeks in the year, that is, a total of 1,200 crossings :—

1. Proportion of annual charges per crossing—£1,450
2. Petrol used per trip, 28 tons at £25 per ton—£700.
3. Oil per trip, 2 tons at £40 per ton—£80.
4. Cost of food per trip for twenty passengers and crew of seven—£100. Total £2,330.

It will be seen from the above that the direct running cost is 38 per cent., and the overhead charges 62 per cent. of the total cost.

Carrying 20 passengers, the rate would be for London-New York, £115 per head, which is equivalent to 8.75d. per mile per passenger.



The rate for mails would be £1,100 per ton, London to New York, or 7½d. per ounce.

SECTION XIII.

PRE-WAR GERMAN AIRSHIP SERVICES.

It is little appreciated in this country to what an extent the rigid airship was utilised in Germany for passenger flights and services before the war. The experience and resources which enabled the Germans to develop the Zeppelin for Naval work and raiding were gained by constant use of airships in civil flying.

Der Deutsche Luftfahrt Actien Geselschaft, D.E.L.A.G. (The German Air Travel Company), was formed in 1910, and was mainly financed and managed by the Hamburg-America Line, the H.A.P.A.G. This concern ran regular passenger excursions and

One complete section of a Vickers rigid Airship, showing method of vertical erection.

Works: Acton, London, W 3.

to a limited extent regular town to town services during the years 1910 to 1914.

The following figures for number of trips and mileage are taken from the annual report of this company, issued in 1912. The total number of flights in 1912 was 400. The total flights from commencement in 1910 up to time of report in 1912, are as follows :—

Name of Ship.	No. of Flights.	Hours.	Mileage.	Number of Persons Carried.
"Schwaben"	230	499	28,468	4.622
"Victoria Luise" ...	285	663	36,600	3,953
"Hansa"	188	418	22,960	4,007
"Sachsen"	58	133	7,820	1,335
Others				
Totals	826	1,853	102,675	17,221

From the above it will be seen that in this period 826 flights had been made, and 17,221 passengers carried without any mishap. The "Sachsen" only went into commission early in 1912, hence only is shown a small number of trips.

These airships had spacious passenger cabins, holding thirty passengers, fitted up in a most luxurious style, with inlaid mahogany panelling, carpeted floors, and comfortable armchairs; in general shape and style similar to a Pullman car, with large windows from which the passengers could look at the ever-changing scenery, and were served with lunch or tea as required from a buffet.

Owing to the novelty, the company mainly confined its enterprise to short distance pleasure excursions of two to three hours, at the rate of 100 marks (or £5), including lunch. These airships carried thirty passengers at a time, in addition to the crew of eight. The attraction was so great that places had to be booked days ahead. At the same time periodic trips were run from Berlin to Leipzig-Dresden-Munich, as will be seen from the route map which was issued with the company's prospectus.

Sheds and aerodromes were built by the D.E.L.A.G. at Potsdam, Leipzig, Dresden, and Munich, etc.

The company was able to make a profit, and also received a subsidy from the Government for the use of the airships for training the army and navy airship crews.

There is no doubt that the Germans are preparing and organising for an extensive scheme of air travel, and some time ago mention was made in the Press of a company formed for an airship line from Berlin to Constantinople, stopping at Munich and Vienna.

THE WAR WORK OF THE VICKERS' AIRSHIP DEPARTMENT.

During the war and subsequently the Airship Department of Vickers, Ltd., have produced :—

Three rigid airships for Naval service.
One airship to their own design, now nearly complete.
A large proportion of the component parts for four other rigids built at other stations.
Three large non-rigid ships.
Twenty-six kite-balloons.
Two hundred and fifty gasbags for rigid airships.
Seven outer covers for rigid airships.
Thirteen envelopes for non-rigid ships.
Six spherical balloons.

In addition Vickers, Ltd., were the first firm in Britain to build a rigid airship and with any experience of the design of such structures, and they placed the whole of their experience at the disposal of those other firms which undertook such work.

The present Airship Department was formed in April, 1913, when Vickers, Ltd., were requested by the British Admiralty to put forward proposals for an experimental rigid airship to be of the same size and general type as the types of Zeppelin airships then in service in Germany; and for three non-rigid airships of the "Parseval" type.

At this time, no design data for rigid airships was available, the only information in our hands being a few general exterior photographs of some of the D.E.L.A.G. passenger Zeppelin airships.

Vickers' representatives visited such of the German airship sheds as were accessible, and picked up such particulars as could be obtained from casual inspection of the exterior of these ships.

It is difficult, when so much knowledge is now available, to realise the magnitude of the problems required to be solved in this initial work. No particulars of weights or of the detail design of the ship components being available, it was necessary to make tentative designs of all parts of the ship in order to obtain approximate data on which the final design could be based. Even the general principle of construction of the hull framework of the German airships was not known, and many different systems were investigated before the final design was determined.

By the end of 1913 a final design was submitted to the British Admiralty, which, with minor modifications, was approved and a contract arranged with Vickers, Ltd., for building an airship at Barrow-in-Furness. This airship was subsequently numbered "R.9" and was the first rigid airship to be delivered to the Naval Service.

The work of construction was commenced at Barrow at the beginning of 1914, when workshops were equipped at Cavendish Dock for the structural work, and half of the old airship shed there partitioned off for the fabric work on the gasbags and outer covers, etc.

Experimental work was started on the building of hull girders, but great difficulties were experienced in the manufacture of the thin and light "Duralumin" sections required. At first it was found practically impossible to produce straight angles and channels, and it was only after a long time, and at great expense, that these difficulties were overcome, and the manufacture of girders was enabled to proceed.

In March, 1915, instructions were received from the British Admiralty that the construction was to be suspended, as it was then thought that the war would be over in a few months, and the Walney building shed was commandeered by the Royal Naval Air Service for a flying station.

After the remarkably effective work done by the German Zeppelin airships with their fleet at Jutland and elsewhere, it was decided by the British Admiralty that R.9 should be completed, and to put in hand further rigid airships of improved type.

The resumption of the construction was greatly impeded owing to a considerable quantity of the previously completed steel wires and other materials having deteriorated during storage and having to be replaced.

The designs of R.9 were at this time completed, and all the difficult manufacturing problems solved, and it only remained to carry on the completion of the airship.

R.9 eventually left Barrow on April 4, 1917, after carrying out very successful flight trials over Morecambe Bay. From that date until the present time this airship has been stationed on the East Coast of England, and in the words of the Admiralty "has proved to be not only invaluable for the training of officers and men, but also in assisting to carry out the patrol of the East Coast."

23 CLASS RIGID AIRSHIPS.

At the latter end of 1915 it was decided by the Admiralty to build rigid airships of an improved R.9 type, and in order to develop resources for an airship construction the Admiralty decided that Beardmore and Co. and Sir W. G. Armstrong, Whitworth and Co. should also take up this work, and accordingly orders for vessels were placed with Vickers, Ltd., and them.

The whole of the designs and working drawings were prepared by Vickers, Ltd., and circulated to the other builders.

When these airships were commenced, Vickers placed all the experience and the knowledge derived from their costly and difficult initial experimental work entirely at the disposal of the two competitive firms starting in this industry. Their representatives made many visits to the Vickers works, and all knowledge and experience of design and construction was freely imparted to them, and thus rendered it possible for them to commence manufacture immediately. Also, much of the design thus circulated to those other firms was fully covered by patents which were freely used without any consideration to Vickers, Ltd.

Further, in order to assist the other firms to get ahead with their work, Vickers undertook to supply them with all the bracing pieces, stampings, and forgings required for the hulls of their first ships, and also, in the case of Armstrongs, supplied them with all valves, controls, tank fittings, and other mechanical gear complete, ready for the ship, together with all gasbags, outer covers, and other fabric work, and also assisted the other builders by supplying materials and instructing them in the manufacture.

The airships of this 23 Class, built to Vickers' design, have since commission been engaged on sea patrol work, and have taken a prominent part in the patrol of the North Sea and in convoying shipping. The two airships of this class, Nos. R.23 and R.26, built at Barrow, were delivered in October, 1917, and March, 1918, respectively. These airships have frequently been seen over London, and R.26 took part in the surrender of the German submarines at Harwich. This shape made a record flight of 41 hours.

33 CLASS AIRSHIPS.

These airships are of about 2,000,000 cu. ft. capacity, and orders were placed with Vickers, Ltd., Armstrongs, and Beardmores, in November, 1916. The latter two firms, having large enough sheds, were in a position to proceed immediately, but, the Walney shed not being large enough, Vickers, Ltd., were not able to start erection until the new shed at Flookburgh, near Barrow, could be completed.

In September, 1917, the work on Flookburgh site was stopped on account of the acute shortage of steel at that time, and arrangements were made for the erection of this ship to be taken over by Short Brothers, of Bedford.

In order to give all possible assistance to Short Brothers in facilitating the construction of this ship, all the material that

had been prepared was handed over to them, and Vickers, Ltd., undertook to drill for them all the channels required for the hull structure, and supply all the finished bracing pieces required. They also arranged to make the gas valves and other finished components. The drilled channels and bracing pieces supplied enabled them to proceed immediately with the assembly of girders, and greatly expedited the work of construction.

VICKERS' NEW DESIGN OF RIGID AIRSHIP, R.80.

R.37 having been transferred to Short Bros., Vickers, Ltd., were without further work to proceed with on the completion of R.26, and, as Flookburgh shed and aerodrome were stopped, they were restricted to a size of airship that could be built in Walney shed.

Designs were prepared for an airship of the largest possible size that could be built there. Embodied in this design were all the best features obtained from the German 35 Class, and also the improvements suggested by the experience of the airships of R.9 and R.23 Classes in service.

As the firm were given a free hand in the design, without unnecessary restrictions as to strength, such as were imposed in 23 Class vessels, they have produced a design which for its size is considerably more efficient than any other rigid airships in both weight and general design.

An order for one ship to this design was placed in November, 1917, and it is expected that this airship will be ready for trials very soon. In a new design, the rate of building of the first ship is entirely determined by the rate at which the drawing-office can produce the working drawings and the material ordered. If a second airship were ordered, it could be produced in considerably less time, as all the material could be ordered at once and all the work put in hand.

THREE PARSEVAL NON-RIGID AIRSHIPS NOS. 5, 6, 7L.

No. 5 was built entirely in Germany, and was in the hands of the Germans at the outbreak of war.

Nos. 6 and 7 were built at Barrow, and after the outbreak of war a large number of alterations in design were made as a result of active-service experience with other ships. This caused considerable delays in completion.

No. 6 was taken over by the Admiralty in June, 1917.

No. 7 was taken over by the Admiralty in September, 1917.

OTHER AIRSHIP WORK.

S.S. TYPE AIRSHIPS.—Four of the small submarine-spotting airships for coast patrol were made for the Admiralty, and delivered at the beginning of 1916.

KITE BALLOONS.—Some of the earliest kite balloons made in England were made at Barrow, and a subsequent contract was obtained for 26.

AIRSHIP WORK PRODUCED AT DOUGLAS FACTORY.

Early in 1916, when the demands for gasbags, etc., for war purposes were greater than could be met with at Barrow, Vickers, Ltd., organised a factory at Douglas, Isle of Man, for the carrying out of this work. This factory has produced the bulk of the Government requirements for rigid airships, in addition to a large quantity of non-rigid envelopes and balloon work, and includes 250 gasbags for rigid airships, 7 complete outer covers for rigid airships and numerous spares, one 360,000 cu. ft. Parseval envelope and rigging, six 360,000 cu. ft. North Sea type envelopes, six 70,000 cu. ft. A.P. envelopes, six spherical balloons; quantities of target balloons, flotation bags for aeroplanes, ballast bags, suspension fittings, and other details for envelopes assembled elsewhere.

"IOCO" PROOFING FACTORY, GLASGOW.

Before the war, practically all the proofed balloon fabric used in England came from Germany, and when the large airship programme was initiated by the British Government early in 1915 the supplies of prooted fabric were difficult to obtain.

In conjunction with the "Ioco" Proofing Company, Vickers, Ltd., installed plant and commenced the proofing of airship fabrics.

After the initial difficulties were overcome, this factory was so successful that it developed into one of the chief, if not the leading, manufacturers of this class of material.

Its production at the date of the Armistice was 50,000 yards of completed fabric per week.

AIRSHIP ENGINES.

In the year 1913 Vickers, Ltd., obtained the exclusive manufacturing rights for the British Empire of the German Maybach engine.

Engines to the Wolseley-Maybach design of 180 b.h.p. were manufactured at the Wolseley Company's works at Birmingham, and fitted to rigid airship R.9 and the Parseval airships Nos. 6 and 7.

Wolseley-Maybach engines of 240 b.h.p. are now being manufactured at the Wolseley Company's works for fitting in rigid airship R 80.

This engine has shown itself in service as being pre-eminently suitable for airship work, owing to its consistent reliability and low fuel consumption.

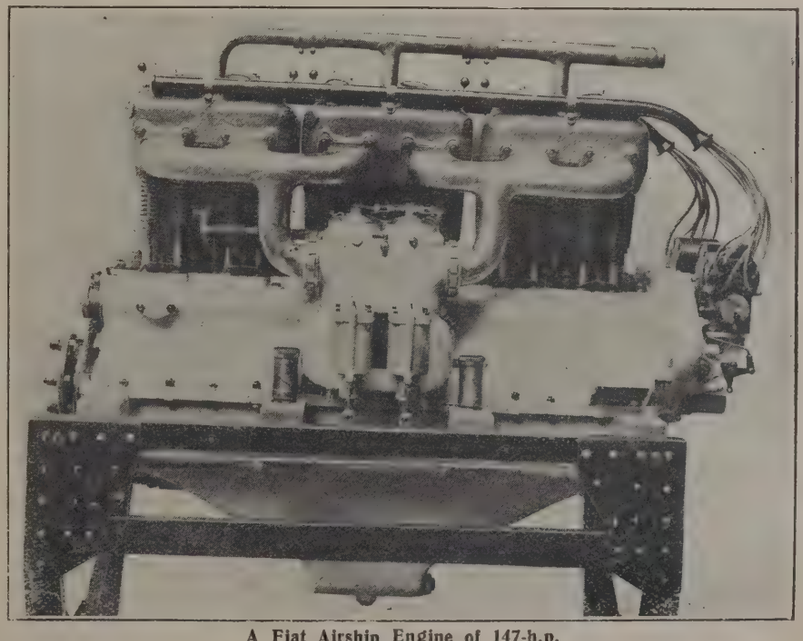
AIRSHIP SHEDS.

At the end of 1915, when it was decided to carry on with airship construction, as Vickers, Ltd., had the old Walney shed available, it was decided that new sheds should be built first of all for Armstrongs, Beardmores, and Short Brothers, before building a larger shed for Vickers, Ltd.

It was not until October, 1916, when the new sheds for the other firms were completed, that the British Admiralty decided that a new large shed should be built for Vickers on a site selected at Flookburgh, near Barrow-in-Furness.

Work on the site and foundation were subsequently put in hand, but in September, 1917, owing to shortage of steel, the Admiralty stopped all work on the shed. This has temporarily placed the company at a disadvantage for future work, as the trend of airship development is towards greatly increased size.

They are, however, now making arrangements, and a large shed will be built as soon as it is necessitated by the development of commercial airships.



FIAT AIRSHIP ENGINES.

The requirements of an airship engine are quite different from those of a heavier-than-air machine. With the latter, as at present constructed, at any rate, it is impossible to carry out repairs while in the air. The airship, on the other hand, can remain aloft without its engines working, which allows of quite extensive repairs.

It is precisely because adjustments and repairs are looked upon as possible of execution that the Fiat airship engines built during the war for the Forlanini dirigibles are a distinct departure from the aeroplane types designed by this company.

This engine is a six-cylinder type having four valves per cylinder on opposite sides. The cylinders are cast in pairs, and are fitted with steel liners. Their bore is 125 m.m., and the stroke 190 m.m. The horse-power is 147.

Everything has been thought out with a view to ease of control and quick repair. The valves are not enclosed and can be changed readily. There are two oil pumps, mounted on the extremities of the camshafts. The magnetos are at the opposite end of the engine, driven from a short cross shaft, but having their distributors and contact breakers outwards for greater accessibility.

THE CONSTRUCTION OF BRITISH RIGID AIRSHIPS.

Contributed by Sir W. G. Armstrong, Whitworth & Co., Ltd.

AT SIR W. G. ARMSTRONG, WHITWORTH AND CO.'s WORKS, BARLOW.—The framework of R.25 in position on the erecting cradles.

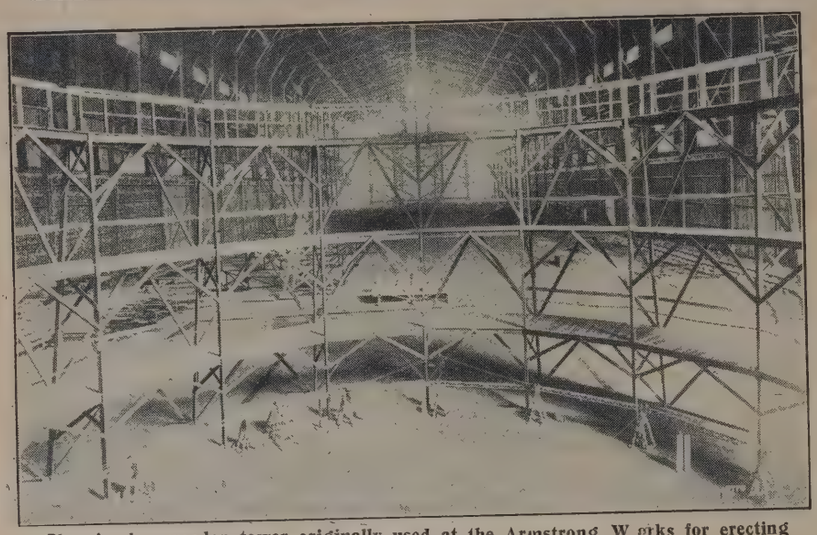
A considerable time prior to the outbreak of war, Sir W. G. Armstrong Whitworth and Co., Ltd., the well-known armament firm of Newcastle-on-Tyne took up the question of rigid airship construction and purchased a site at Barlow, near Selby, in Yorkshire, upon which to erect special airship works.

The works comprise a large erection shed built of corrugated iron and steel, the interior dimensions of which are 150 ft. wide by 711 ft. long by 125 ft. in height, also large workshops of brick and steel, the principal buildings being about 560 ft. long by 90 ft. wide by 25 ft. high and 260 ft. long by 101 ft. wide by 45 ft. high. There are also separate buildings for offices, canteens, etc.

The building of the works commenced in January, 1916, and by July 1st of that year were so far advanced that airship erection commenced.

The first airship put in hand was R25. This ship was 535 ft. long by 53 ft. in diameter and had a gas capacity of 900,000 cubic feet. She was fitted with four 250-h.p. Rolls-Royce engines.

The lattice-work duralumin girders, and machinery and control cars, were made by the firm at their girder and car works, Newcastle-on-Tyne, the labour employed being mostly women.



The assembling of the frames and all ship erection was done at Barlow, the method of constructing the hull in the early stages being the same as already adopted by Vickers, Limited, who very kindly supplied information on the subject and facilities for the inspection of their works at Barrow-in-Furness.

The method consisted of building up in a wooden jig or tower complete sections of the hull. These sections, which consisted of two transverse frames connected together by longitudinal girders and wired up, were then hoisted out of the tower and placed vertically on iron cradles fixed on the floor of the shed to receive them.

The cradles were furnished with a curved track to correspond with the circumference of the sections, and the latter were fitted with rollers which rested upon this track. The cradles were carefully spaced apart so that when the full number of sections were

AT SIR W. G. ARMSTRONG, WHITWORTH AND CO.'s WORKS.—Girls assembling girders for rigid Airships.

The circular wooden tower originally used at the Armstrong W orks for erecting Sections of Airships.

placed in position upon them a space equivalent to the length of the section was left between any two sections.

Therefore, to compiete the hull, it was only necessary to link up the sections by longitudinal girders, rivet up their joints and insert the necessary wires which are used to stiffen up the hull.

The various parts which are used to make up the hull construction are finally secured in place by riveting. This process is done by female labour, presses being used wherever possible, the remainder being done by hand.

To enable every portion of the hull structure to be reached, the latter was rotated bodily upon the cradles to any position desired, by means of pulleys and suitable tackle.

When the entire hull had been completed and riveted up, each bay on the inner side was covered with strong cord netting of about 9-in. mesh, forming a lining throughout the ship to give additional support to the gas bags.

In the case of R25 a keel triangular in cross-section and constructed of steel tubes was attached externally to the lower portion of the hull, and to place this keel in position it was found necessary to raise the hull bodily from the cradle; an extremely delicate operation in view of the fact that the keel lends considerable strength to the structure, and without it the hull was quite incapable of withstanding even its own weight unless equally supported at many points.

This difficulty was overcome at Barlow by attaching a sufficient number of counter-balance weights to the structure by means of ropes passing through pulley blocks in the roof of the shed until the hull was almost entirely supported, and then raising the structure by several rope tackles operated simultaneously from one point.

By this means the hull was successfully raised 24 feet in four minutes without a stop and without distorting the framework in the slightest degree. This height gave ample room for fitting on the keel and also the three cars which are slung below the keel.

Whilst this work was being done the structure received additional support from light scaffolding from the ground.

The fins, rudders and elevators were then placed in position, gas bags inserted and the outer envelope put on. The latter is made up in panels which are laced tightly together in place, the lacing joints being afterwards sealed up by doping on strips of fabric.

As this work proceeds the bags are gradually further inflated with hydrogen until the ship finally begins to lift from the supports and slings. Instruments and accessories are put in, machinery finished off and tested under power, the ship being secured in the shed for this and other tests by suitable means until finally the work is completed and the ship ready for flight.

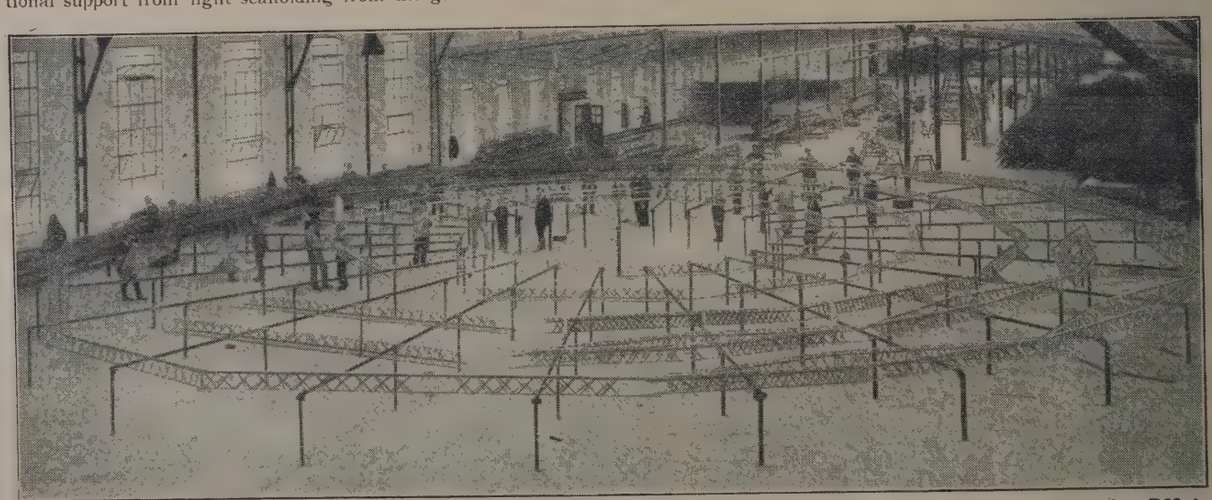
R25 was completed in October, 1917, and was the second British rigid airship to be handed over to the Navy (R9 being the first and R23 being the third. Both of these were constructed by Vickers Ltd. R23 was delivered to the Admiralty only one day after R25).

Shortly after beginning work on R25 it became evident to the staff at Barlow that the method of erection adopted left much to be desired, particularly from a mass production point of view.

The time lost in completing sections before the final assembling of any considerable portion of the hull could be commenced was very great.

Further the wooden towers required to be altered continually to suit tapering portions of the hull, which would be a great obstacle in building streamline ships. Most important of all, it was found that the sections tended to alter slightly in shape when being lifted, necessitating the greatest care being used when linking one or more sections together to keep the structure true and to prevent unequal strains being set up on the girders and wires.

It was felt that these difficulties would enormously increase in building larger ships, and to overcome them a new method was devised. The towers were abolished and the circular transverse ribs or frames were constructed on horizontal radial jigs.



The frames were then slung into a vertical position and placed on the cradles; in that condition they were merely enormous hoops or rings. To stiffen up these frames to make slinging them possible, as they were extremely fragile and flexible, a pole about 4 inches in diameter and 14 feet long was placed vertically in the centre and wires were attached from the top end of the pole on either side to each of the main joints of the frame and carefully tautened, thus making it resemble a large wire wheel. They were then lifted without difficulty.

When each frame was placed in position on the cradles it was immediately connected up to the next frame by longitudinal girders, the intermediate girders placed in position, and the whole temporarily secured by bolts. After this the lower portion of the structure was riveted up and the wiring gang followed along and permanently wired up the hull.

Upon the whole lower portion of the hull being completed the structure was rotated upon the cradles to enable the remainder to be riveted and finished off.

This method was tried in building R29, the next Barlow ship. The photograph showing R25's outer cover being fitted shows eight weeks' progress on the hull of R29 by the new method of erection.

So successful was this scheme of erection that it was adopted

The radial jig for erecting frame rings of rigid Airships, devised by Armstrong, Whitworth and Co. Frames for R39 in course of assembly.

WHY ?

Have that car hung up because it needs repairs ?

Perhaps it wants tuning ?

At present we can put in hand immediately any kind of repairs or general overhauls.

Get into communication with us at once.

STAG LANE, EDGWARE.

in subsequent Barlow ships, R33 and R39, and was also adopted by Beardmore and Company in building R34, and in part by other firms.

When information on the construction of German ships became available it was found that they also had in use a scheme somewhat similar and had abandoned the use of towers.

R29 was completed by Armstrong, Whitworth and Company, in May, 1918. She was the same length and diameter as R25, but small variations in shape and to her internal arrangements gave an increased gas capacity of 980,000 cubic feet. By discarding the external keel and fitting a triangular internal keel of duralumin girders and by several other improvements in design a disposable lift of 8.63 tons was obtained.

This increase of 3½ tons in lift over the R23 class ships made this ship the first British rigid to be really capable of use against the enemy. She had an armament equipment of eight 120-lb. bombs and numerous machine-guns. On four occasions she was in action against submarines, one of which was believed to have escaped, one was damaged and became a prey to a British destroyer, one struck a mine and was sunk whilst the action was progressing, and the fourth was sunk by a direct hit from a bomb from the ship.

The outer cover of R25 being fitted to the frame. In the foreground the hull of R29 is in course of erection.

The hull of R29 having an internal keel it was unnecessary to lift it from the cradles before completion. The final lifting to enable the cars to be placed in position was done by inflating the gas bags. R29 was similar in machinery and car equipment to R25.

R33 was the next ship to be constructed at Barlow by Armstrong Whitworth and Co., Ltd.

It has been freely stated that this ship was entirely copied from L.Z.33 which was brought down almost intact near Colchester, a statement which is not quite correct. British designers naturally availed themselves of the opportunity to study the German design and obtained much valuable information, incorporating in subsequent ships features of the German ship which were found superior to our own, but the greater portion of R33 was of British design.

In any case it should be pointed out that whilst this information undoubtedly assisted our designers it was of very little value to constructors in overcoming difficulties of erection.

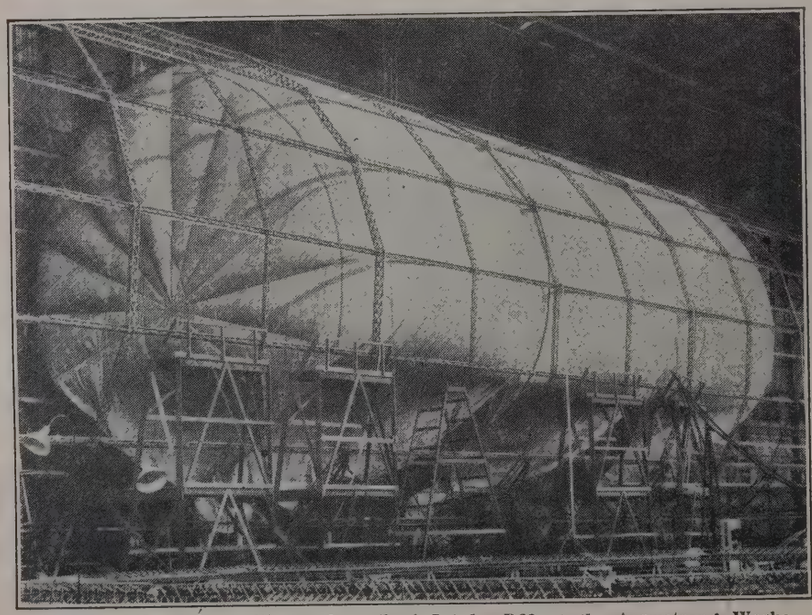
R33 has a total length of 640 ft., maximum diameter of 78 ft. 9 ins., and a gas capacity of 2,000,000 cubic feet, giving a disposable load of 29½ tons.

The hull is divided by radially wired main frames into separate compartments into each of which a large gas bag is closely fitted.

There are four cars, the forward one being divided into three compartments, the front compartment being reserved for navigating officers, the centre one for the wireless gear, and the after portion for a 250-h.p. Sunbeam engine.

Two wing machinery cars, each containing a 250-h.p. Sunbeam engine, are fitted abreast of each other, one on the starboard and one on the port side, amidship along the hull and about 30 feet apart.

The after car contains two 250-h.p. Sunbeam engines driving through gearing one large propeller. Either one or both engines can be used simultaneously. In addition duplicate steering and elevating gear is fitted in this car for use in emergency



The hull has an internal keel or corridor constructed of duralumin girders and running the whole length of the ship.

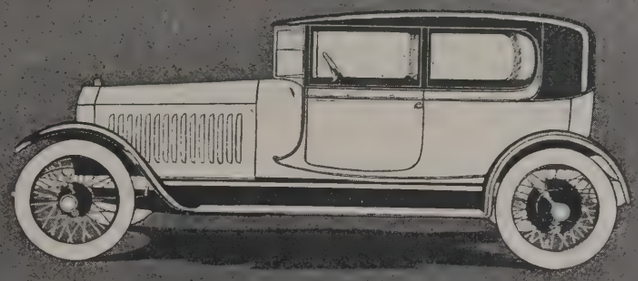
This corridor provides space for housing the petrol tanks, which have a total capacity of 20 tons, also the water ballast bags, and space for the crew when off duty.

Access to the various parts of the ship is obtained by a walking-way passing through the corridor, ladders from it give access to the cars, and a tabular shaft with wire rope ladder suspended inside leads to the gun platform and top of the ship.

R33 was successfully put through her first flight trials on March 6th, 1919.

During the completion of the construction of R33 a ship of similar design, viz., R35, was put in hand. This ship was of the same type exactly, but having an increased length of 672 ft. Upon completion of the girders, and before actual hull erection commenced, it was decided to suspend operations on it and proceed with the building of a much larger type, the R39, the design of which is purely British. Work is being pushed rapidly forward in order to get this ship into commission at the earliest possible moment.

Three gas-bags in position and partly inflated. R29 at the Armstrong Works.



She will be one-third larger than the 33 class ships, and will have a gas capacity of 3,000,000 cubic ft. The total length is 694.5 ft. and maximum diameter 85 ft. Six power cars are provided, each with one engine. Four of the engines will be of 350-h.p. each, and two will be of 275-h.p.

In addition there will be one control car attached immediately under the forward portion of the hull of the ship. The interior will be similar to the R33 class, though greatly improved, so far as general arrangements are concerned.

The airships and aeroplane departments of Sir W. G. Armstrong, Whitworth and Co., Ltd., have been conducted entirely separate from each other, each branch having its own management and staff, although both are jointly controlled by Capt. I. F. Fairbairn-Crawford, R.E., general manager of the aircraft department, who has been connected with aviation from its commencement in England.

Owing to the fact that there were few—if any—trained airship engineers and practically no reliable information on the subject at the time when the work was started in 1916, the utmost care and

thought had to be used to overcome the thousand-and-one difficulties which were to be met with in the building and handling of large rigids.

Special tools had to be designed and appliances for lifting and handling the ships devised, and workpeople had to be trained in everything relating to this new class of work. These difficulties have been successfully overcome, and to-day the Barlow works have a trained staff capable of carrying out every process in connection with airships, from and including making the hull, cars, fabric work, gas bags, etc., to manufacturing the hydrogen gas and handling the ship when going in or out of the shed.

View of the skeleton of R39, showing the interior corridor forming the keel.

AIRSHIP v. AEROPLANE.

It is now fairly generally accepted by those who are reasonably well informed that in the development of commercial aviation both the airship and the aeroplane will play their part, each in its own sphere of action, and that the one will supplement the other rather than attempt to compete with it.

In the present state of the development of aircraft it can safely be said that for carrying large cargoes for long distances without stops at speeds up to about 70 miles per hour the airship cannot be rivalled by the aeroplane either in cost or in reliability.

On the other hand, for relatively small cargoes, to be carried at considerably greater speeds, and particularly where landings can be made at reasonably frequent intervals, the aeroplane need not fear the competition of the airship.

It would not be altogether safe to assume that these conditions will always hold, however.

The design of large rigid airships is—so far as the structure itself is concerned—a very complex problem. Apart from the purely structural difficulties, however, the airship is a relatively simple affair with definite limits to the possibility of improvement.

The weight of a cubic foot of air under given conditions of temperature, pressure, and humidity is unalterable—and fixes the total lift which can possibly be obtained from a ship of any given volume. It is highly improbable that any fluid less dense than hydrogen will ever be found, and even if it were, there can be but little gain.

The problem of securing that form of hull which will give the minimum air resistance for a given displacement is—as aerodynamic problems go—a simple one.

Thus apart from propulsion, the problem of improving upon the present type of airship is mainly one of structure design to secure the necessary strength for the minimum of weight.

Improvements in propulsive machinery would have as great an effect upon the development of the aeroplane as they would upon that of the airship.

The aeroplane is as susceptible as is the airship to improvement in structural design.

The aerodynamical problems involved in aeroplane design are much more complex than those presented by the airship, and the prospects of really important improvements in efficiency are very much greater.

Thus, over and above the possible beneficial effects of the discovery of better structural materials, the better use of the materials, of improvements in the power plant, and of the methods of propulsion employed which are likely to affect both the aeroplane and the airship to about an equal extent, there is a distinct probability that in the aeroplane it may be possible to increase very considerably the total weight which can be carried at any given speed, per h.p. of power plant installed.

There is very little possibility of any equivalent improvement in the aerodynamic design of airships, and although it is reasonable to expect the airship to increase in size, and in its ratio of disposable lift to gross lift in the future, it is also to be expected that the aeroplane will develop at an even more rapid rate, and will gradually encroach upon what is now regarded as the airship's special sphere of usefulness.

THE CONSTRUCTION OF R.34.

Contributed by Wm. Beardmore & Co., Ltd.

Following the successful flight across the Atlantic by a British aeroplane with British engines and piloted by a Britisher, the notable achievement of H.M.A. "R34" in performing the double journey to New York and back is very gratifying in that it is also "All British."

Now that the war has been brought to a successful termination, it is possible to publish some particulars of this most interesting ship. She was built, equipped, and tried in Scotland by Wm. Beardmore and Co., Ltd., of Parkhead and Dalmuir, at their new airship works at Inchinnan in Renfrewshire. The direction of all the work carried out at the new shops and erecting shed took place from the naval construction works at Dalmuir.

During the very early days of the war this firm undertook the construction of aeroplanes and seaplanes for the Admiralty, and erected and equipped up-to-date shops suitable for the work.

When the Admiralty began their programme of airship building, Beardmore's were amongst the first firms to undertake the construction of large rigid airships.

R34 is the latest product of their works, and has been consistently successful in all her trials and long flights.

The land taken over at Inchinnan as a flying ground for airships extends to over 360 acres, and the sheds and buildings now cover nearly 8½ acres.

The actual construction of airships was started there about July, 1916, and two ships of moderate size were completed and tried out before R34 was put in hand.

R34 and her sister-ship R33 are the two largest ships yet built in Britain. The overall length of the airship is 645 ft., and the greatest diameter 78 ft. 9 ins. There are in all 18 gas bags, with a total capacity of 2,000,000 cubic feet. This is equal to a gross lifting power of 60 tons under standard conditions, and the lift which is useful, apart from that required for hull and other constructional items in this ship, is practically 30 tons. Every care was taken during the design and construction of the ship to keep down weight in every part, and the result has proved that this has been thoroughly successful without in any way detracting from the necessary strength.

The section of the ship takes the form of a polygon with 13 sides, and is built up of main transverse frames, rigidly wired, placed every 10 metres in her length, with intermediate transverse frames of lighter construction placed between them. The whole is bound up by longitudinal girders, the main members placed at the 13 angles in the main transverses. Intermediate longitudinals are also fitted, thus giving the ship finally the appearance of being a polygon with 25 sides. It is over this that the outer cover, or fairing, of fabric is stretched. The gas bags are placed inside each of the bays formed between main transverses and are attached in no way to the structure of the ship, but impart their lifting power wholly to the ship by their pressure on the underside of the upper portion of frames. The main transverse frames are built on special jigs on the ground and, after being completely riveted up and wired, are lifted by means of specially designed king-posts on to the building cradles. At every joint a trolley is fitted having large flanged wheels, so that the structure can be rotated in drums to facilitate the work of fitting the longitudinal girders.

After the hull framework is completely riveted up, the fore and aft and diagonal bracing wires are put into position and tensioned to the desired tautness.

The whole structure is then ready to lift for attaching the gondolas. In the case of R34 all the fins, rudders and elevators were attached to her after end before she was lifted. The ship is actually lifted into the new position by her own gas bags.

The gas bags, which are also produced at Beardmore's own works, are composed of a very fine quality of single ply cotton fabric with rubber on the inner surface. The inner surface is completely covered with goldbeaters skins laid on with rubber solution, and the whole is then varnished over.

By careful workmanship and the use of only the very best materials, very great impermeability to gas has been obtained with a remarkably low weight.

As it is impossible, of course, to arrange that an airship be always maintained upon a perfectly level keel, and also to meet the possibility of any gas bag becoming partly deflated, arrangements have been made to lessen the excessive pressures which might be set up during such conditions. A central wire is run from end to end of the ship along the longitudinal axis, tying together the transverse bracing wires to assist in this work.

The outer cover is composed of very light linen fabric to which has been applied weather-resisting dopes before the material is made up into the necessary shape. After the cover has been fitted to the ship and laced up to take as much of the slackness out of it as possible, it is again doped with a view to ensuring it being absolutely taut and rainproof.

Five cars are fitted to the ship, one of which is used for navigation, whilst all the others contain engines. The navigation car and No. 1 engine car are placed close together and give the appearance whilst the ship is in the air of one long car.

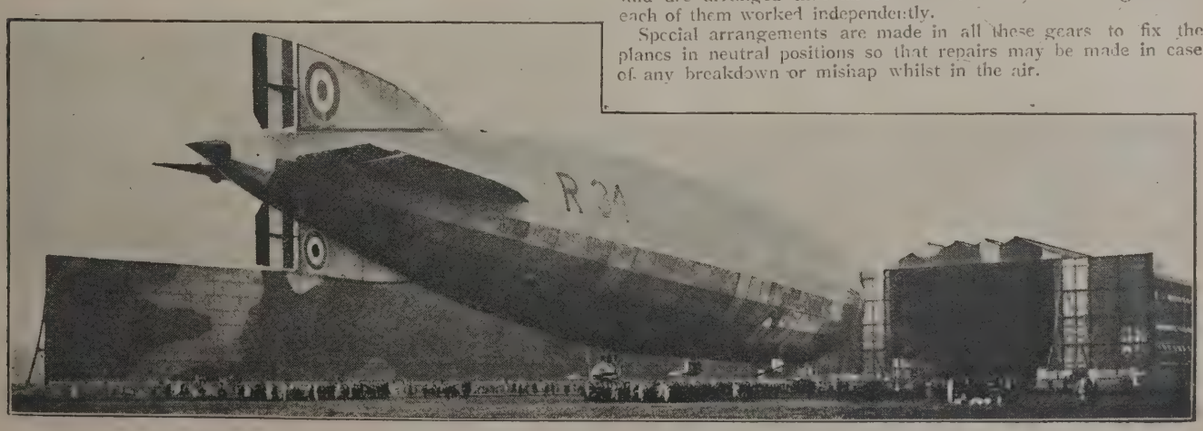
The forward control or navigation car has a covered means of access to the hull of the ship, the others have open ladders.

The ship is fitted with 5 Sunbeam-Maori engines, each of 250 h.p. Two engines are in the after car geared together to drive a single airscrew 19 ft. in diameter. The other engines, one in the forward engine car and one in each wing car, drive airscrews 16 ft. in diameter.

The after car is arranged to act as an ancillary control car, if necessary, and is fitted with a second set of controls and instruments.

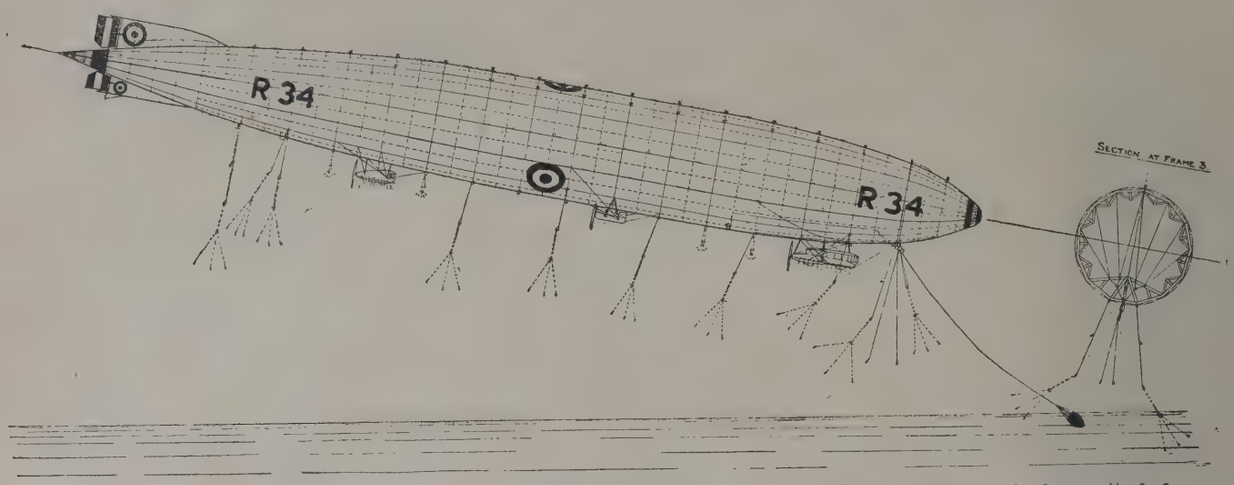
The ship is fitted with an internal keel or corridor of triangular shape, which stretches from end to end. There is a walking way running all through it, and this forms the means of communication between all the various parts of the ship. On the side of the corridor on special box-shaped girders running fore and aft, there are suspended all the accessories, such as petrol tanks, water ballast bags, bomb stowage, etc.

Part of the corridor has been widened out to form the crew space and is fitted with tables, stools, drinking tanks, and being entirely surrounded with curtains is wonderfully comfortable and free from noise.



Many of the petrol tanks are designed so that they can be slipped to take the place of ballast in case of emergency.

The gas bags are each fitted with an automatic relief valve designed to blow at a certain pressure, and nine of the gas bags have a manœuvring valve placed on top. These may be operated as desired from the forward car and are used, of course, during the manœuvring of the ship for discharging gas when the ship becomes light or for trimming purposes.



All the water ballast bag valves and the flaps for allowing the trail ropes and mooring ropes to fall can also be operated direct from the forward car. All the wires, of which there are nearly 50, passing between the hull and the car, are enclosed in a small streamline fabric casing.

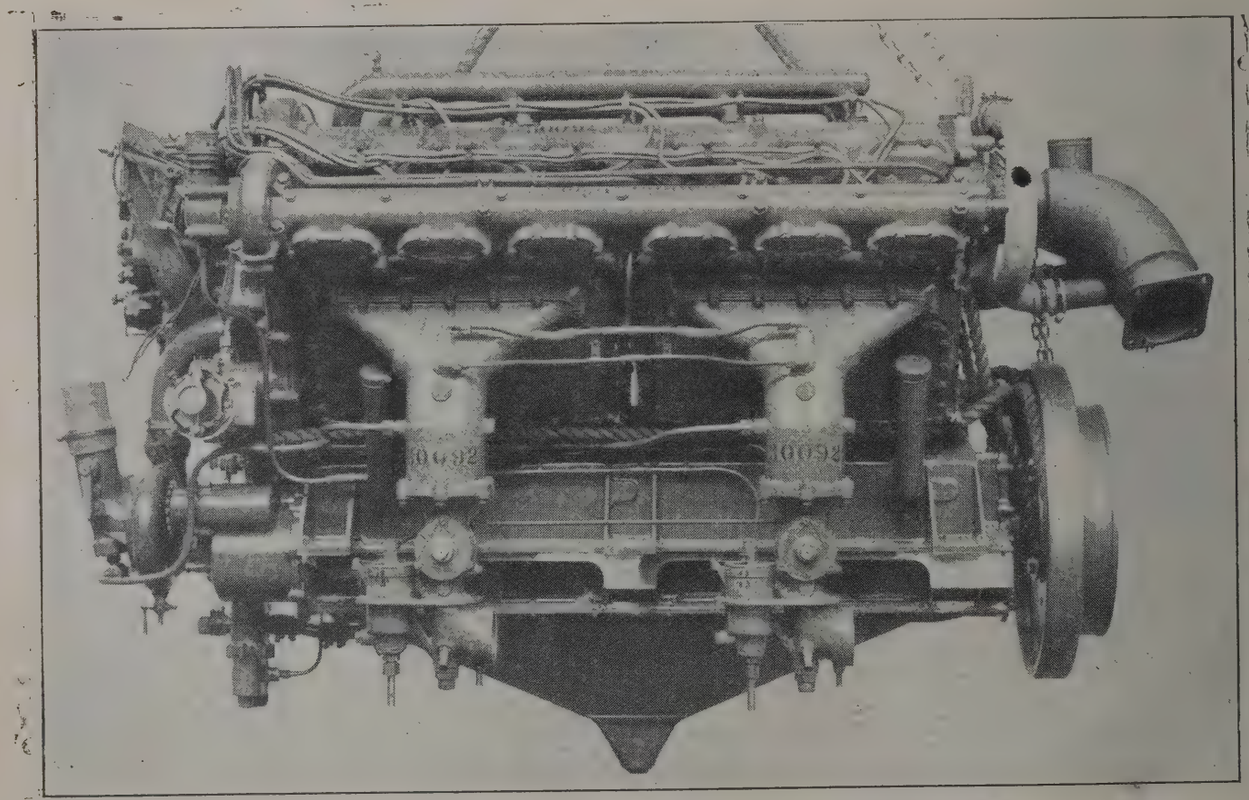
The rudders and elevators are also operated from this car with an auxiliary or secondary control from the after car. They are all hand-controlled, but, as they are balanced, the actual working of them is very light. The controls are designed for working the rudders and elevators from 20° hard-over to 20° hard-over and are arranged that all of them can be worked together or each of them worked independently.

Special arrangements are made in all these gears to fix the planes in neutral positions so that repairs may be made in case of any breakdown or mishap whilst in the air.

R34 about to enter her shed at Beardmore's Airship Works, Inchinnan.

A Diagram of R34 showing the arrangement of the handling and mooring ropes. A droque for use at sea is shown attached to the main mooring rope.

The cars and the corridor are all lighted electrically from generators run by the main engines or alternatively from accumulators carried in each car. Telephone and voice pipe installations are fitted and the wireless apparatus is of the very latest type and special design and has ranges of 500 and 1,200 miles.



The ship is also fitted with directional wireless arrangements by which the position of the ship can be obtained after communication has been established with shore stations.

Particular care has been taken in this ship to provide her with the most effective mooring and handling arrangements. A sketch is reproduced showing these "all down." Of course the ship does not carry all these when she is actually sailing. The handling ropes are fitted with toggles on the end and are removed by the landing party before the ship is finally let go. The fixed part which hangs down from the ship is then hauled up and stowed alongside the corridor. A special drogue is also fitted for mooring over the sea. This is fitted with tripping gear which enables it to be slipped instantaneously.

The R34 was completed towards the end of last year, and her first formal trial lasted just over four hours. Afterwards a special endurance flight was undertaken, and on this occasion she remained up throughout the night for a total period of 19 hours. This flight was made from the banks of the Clyde, down over Ireland and the West Coast of England, and back again.

The official acceptance trial also lasted overnight, but this was due to the fact that fog prevented a landing at her station, East Fortune. The ship was actually in the air for 20 hours on this occasion, and proved thoroughly reliable and satisfactory; it was easily and safely housed after the fog had dispersed.

After being handed over to the Admiralty, the vessel carried out a very notable long-distance flight over the German coast and the Baltic. On this occasion she left East Fortune on the evening of June 17th and returned in the early hours of the morning of the 20th, after having been in the air for 56 hours and covering some 2,400 miles.

A NOVEL TYPE OF RIGID AIRSHIP.

By Short Brothers, Bedford.

At present the section of a rigid airship is generally of a circular or slightly oval form, and as the difference between the internal and external pressure varies from a very small pressure at the lowest point (which may itself vary from nothing to the pressure at which the relief valve is set) to a maximum at the highest point, the resulting tension in fabric, circumferential wires, or supporting rings will vary, being a maximum at the top and very small at the bottom; and this introduces bending moments and other distorting stresses in the supporting structure, which is partially counterbalanced by the tension of radial wires.

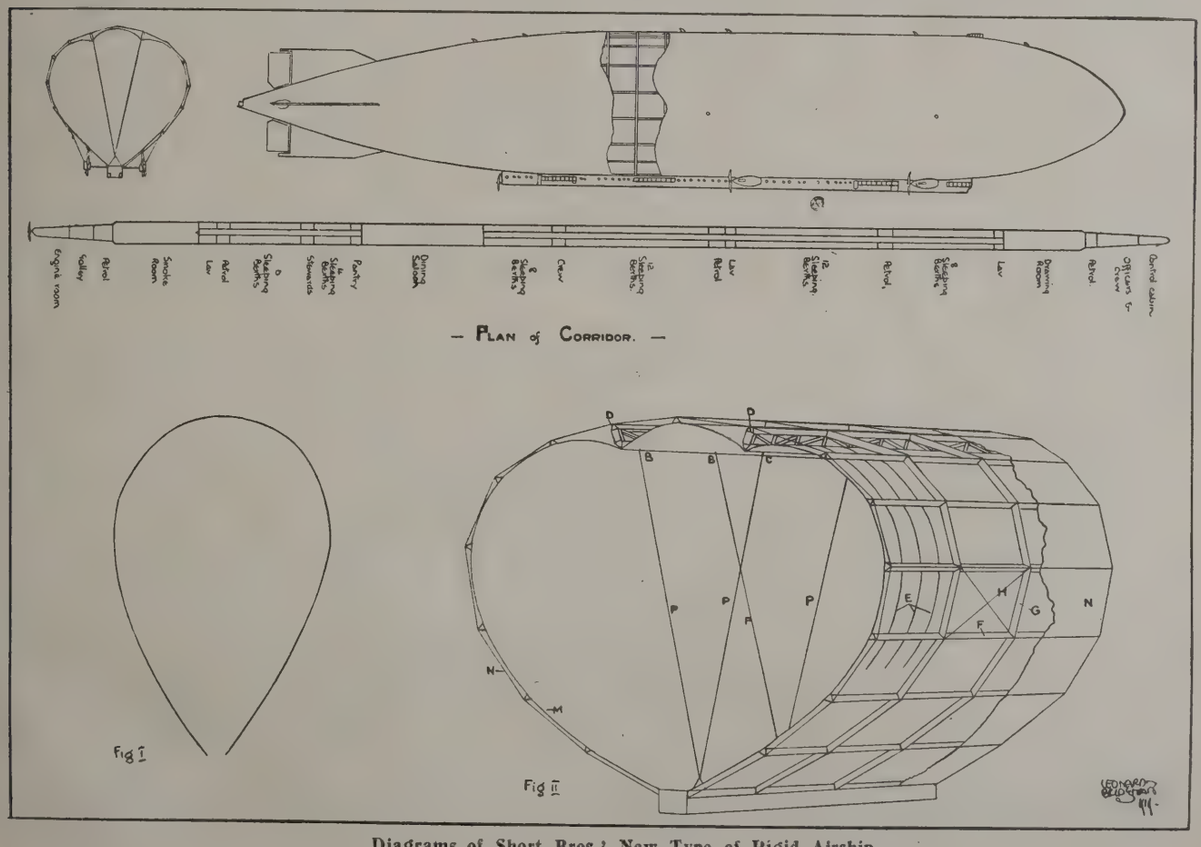
By the proposed method of construction it is intended to make the cross section of a such a form that in the average condition of pressure in the bags the circumferential tension in the fabric, and in the circumferential supporting wires or frames, will be constant, thus avoiding the necessity for most of the radial wires, and reducing the pressure on the longitudinals and the bending moment in the frames.

The shape necessary for constant tension when the pressure at the lowest point is equal to the atmospheric pressure is given in Fig. 1. This is the shape (inverted) which a cylindrical bag made of flexible material and open at the top would take if filled with water. As this shape is unsuitable for a rigid ship owing to the large ratio of height to breadth it is proposed to combine two or more such shapes together removing the internal partitions, and replacing them by tension or lift wires. Fig. 2 shows such a form composed of three sections, the shape being such that the circumferential tension is uniform throughout.

These shapes may be varied slightly on the same principle to suit any average condition of gas pressure which it may be desired to work to, and the number of sections or spans may be varied as desired. The particular form shown in Fig. 2 is the most suitable, as the breadth and depth are practically equal, and the volume is practically the same as a circular section of the same height. The increase in surface is very small and the form is suitable to take longitudinal and sheer stresses.

With this form practically the whole of the lift of the bags is taken by the circumferential wires EE and the lift wires from the re-entrant angles BB and CC which may be led to the corridor where most of the weights are concentrated, or to the gondolas at the sides.

The circumferential wires are secured at the lower ends only, the length being such as to enable them to take up the shape shown. They are kept in position at each longitudinal frame but free to move circumferentially, thus ensuring that no side strain is transmitted to the frames and that the tension is equal throughout.



The upper end of the lifting wires are attached to one of the longitudinal girders or a special longitudinal girder D at the re-entrant angles, and are taken through the bag at suitable points through conical neck pieces or otherwise. The external shape of the framework is maintained in way of these girders with no re-entrant angles so as to reduce the surface friction

The construction differs from that used in certain non-rigid airships in that the external form, more especially in the longitudinal sense, is maintained by the rigid framework composed of transverse frames and longitudinal girders on which an outer cover is stretched, and it is not necessary to depend on any internal pressure at the bottom of the bags to maintain the shape. The general shape of the sections and position of the re-entrant angles are, therefore, different.

The proposed construction combines the advantages of the rigid and non-rigid types, giving the best results with the minimum of weight. The external shape is generally maintained by the rigid framework, but it is of such a form that the gas pressure produces practically no distorting stresses on it.

Further, the end pressure of the gasbags in the event of one being accidentally deflated is at present taken by the taut radial and chord wires, thus introducing an abnormal strain in them.

It is proposed instead to make the ends of the bags slightly convex, or more accurately the shape of the lower end of a pear, as shown in Fig. 3, one fitting close into the other, the supporting transverse wires RR being fitted loosely so as to follow this surface, and supported, if desired, at the centre by a longitudinal centre line wire SS. These transverse wires will not be of any use for maintaining the rigid form, but this is not necessary with the shape put forward in the first part of this proposal. Owing to the shape of the ends the transverse wires need be of much less strength than at present, and the strains

Diagrams of Short Bros.' New Type of Rigid Airship.

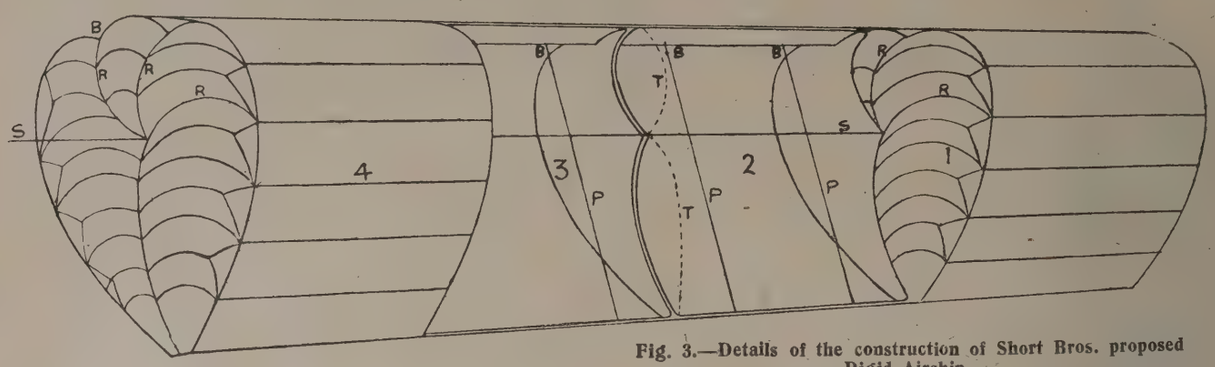


Fig. 3.—Details of the construction of Short Bros. proposed Rigid Airship.

on the main structure caused by one bag being accidentally deflated are reduced to a minimum. The curvature of the end and the position of transverse wires is arranged so that there will be practically no distorting stresses on the framework.

In Fig. 3 four bags are shown in elevation, bags 2 and 3 being in section. In the event of a bag being deflated the end of the adjacent bag, which is concave, will be free to blow out into the desired convex shape, as shown by the dotted line TT in Fig. 3, and incidentally reduce the pressure in that bag. The lift wires from the re-entrant angles BB (Figs. 2 and 3) are led through the bags so that the tension on these will not be unduly increased in the event of a bag being deflated.

The advantages claimed for these proposals are:—

1. Practically no distorting strains in the rigid framework due to gas pressure, leaving it free to perform its main function of providing longitudinal rigidity.

2. The maximum of strength with the minimum of weight.

3. The construction combines the most important advantages of both the rigid and non-rigid types.

4. The stresses on the different members are definite and easily calculated.

PROPOSED AIRSHIP FOR PASSENGER SERVICE—LONDON TO NEW YORK WITH 50 PASSENGERS.

General Specifications.

Length overall	694 ft.
Mean diameter	107 ft.
Height overall	115 ft.
Width overall	120 ft.
Capacity	4,450,000 cubic ft.
Total lift (95 per cent. full)	128.26 tons
B.H.P. in 5 units, 4 gondolas and 1 engine at end of corridor	2750
Speed	60 knots
Total weight of ship ready for flight (excluding fuel, oil, water, provisions, passengers and crew)	63.7 tons
Weight of petrol	44 tons
Radius of action at 60 knots	6,000 nautical miles
Available weight for provisions, water, passengers and crew	20.56 tons

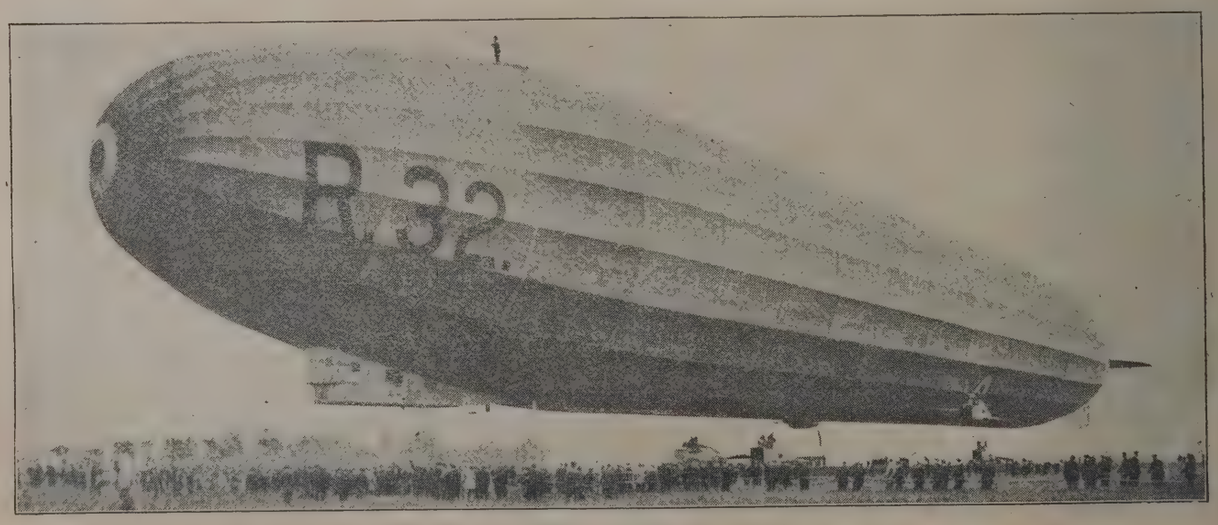
THE CONSTRUCTION OF A WOODEN RIGID AIRSHIP.

The following, a brief description of the R32, is due to Messrs. Short Bros., her builders.

Although of an experimental nature, this ship gave excellent results on trial, her speed being 65 to 70 m.p.h., which is greater than that obtained from any ship at present in commission.

Her principal dimensions are as under:—

Length	615 ft.
Maximum diameter	65 ft. 6 in.
Total capacity	1,550,000 cubic ft.
Total lift	47 tons
Disposable lift	16.5 tons
Ratio, disposable lift to total lift	35 per cent.
Total B.H.P.	1,500
Endurance at two-thirds full power in sea miles	2,200



The shape of the hull approximates to a streamline, the middle portion being parallel and with bow and stern tapered.

The framework consists of a number of main frames built of twenty wooden triangular girders wired to a centre ring by radial wires, which rigidly maintain its shape. These frames are spaced about 30 ft. apart. Equally spaced between the two main frames are two rings of intermediate girders which are not wired and are of much lighter section; these mainly assist in keeping the ship rigid and absorb the difference in tensions in the diagonal wires.

Running longitudinally are a number of other triangular girders spaced at each of the joints of the transverse girders. The number of longitudinal girders so fitted is twenty. The girders are all braced together by diagonal cross wires whose function is to take the shearing forces due to the ship as a beam, and also to take the gas pressure due to the upward lift of the gas.

Running through the keel is a triangular structure of girders forming a passage way, from each side of which are suspended the petrol tanks, water ballast bags, bombs, etc., which are disposed evenly along the keel to relieve the hull as far as possible from undue strain.

The 300-h.p. Rolls-Royce engines are arranged in five units, viz, in two forward cars, two amidship cars and one after car. The propellers, each 17 ft. diameter, are direct driven, and the engines in the amidship car have a reversing gear.

The cars are slung under the ship, the forward and after cars being slung direct to the centre ring and the amidship cars to the framework. The control car is built under the ship at the forward end and from this car the ship is navigated and controlled. The wireless cabin is also in this car.

The fins, rudders and elevators at the tail end are cruciform in shape and consist of a light framework of wooden girders covered with doped fabric. The ship is divided into twenty-one compartments, with a gasbag in each.

An outer cover is stretched over the framework in sections between main frames and is made of a doped cotton fabric. There is a clear air space between the outer cover and gasbags which tends to keep an even temperature in the gasbags. Two types of valve are fitted to the gasbags, viz., manœuvring and automatic. The manœuvring valves are fitted in the tops of the bags and are operated from

AT SHORT BROS.' AIRSHIP WORKS.—The construction of wooden airships Top, Stern View of R31 nearly complete. Centre, Bow of R31. Bottom, R31 in background; framing of R32 in the foreground.

Ever since the R 34 left at frequent intervals the American weather bureau, a most admirable organisation, regarding which you ought to hear the opinions of Mr. Harris, has sent radios giving forecasts based upon more data than are usually available at short notice on your side of the Atlantic. The bureau here works with the utmost personal goodwill, because, to quote its officers, "England has shown the United States remarkable courtesy in allowing an American observer to travel both ways on the first flight, and also given us every information down to samples of the castrol oil for engine-bearings, which we want to analyse for our own purposes."

the control car when it is necessary to alter the trim of the ship. The automatic valves are placed in the bottom of the bags, just above the corridor. These are arranged to blow off at about 3 m/m water pressure. The gas is led from these valves to the top of the ship through exhaust trunks.

At the top of the forward end of the ship is fitted the gun platform, and machine-guns are also fitted at various points on top of the walking way, at the tail end and in all the cars.

A strong structure is built into the after end of the control car to act as a mooring point and the ship is moored to this point on open ground or over the sea. In the latter case a drogue is used which is made of fabric in the shape of a truncated cone which trails in the sea.

During flight, arrangements have been made for hot food to be supplied to the officers and crew by means of an exhaust-heated cooking apparatus.

A TRICKY BUSINESS.—The three photographs on this page show the nose section of the frame of R32, firstly completely assembled in a vertical position, secondly half-way through the process of being turned over, and lastly in the final horizontal position resting on its cradles.

INVARIABLE RELIABILITY

THE Humber Car is ideally distinctive both in design and finish. It is the superlative example of riding comfort and smooth-running efficiency, reflecting in every detail the many advances made in Motor construction since Motoring was first conceived. It is the acme of economy and endurance—the ideal car.

WHY?

BECAUSE only the best material is admitted into the Humber Works.

Because only highly-skilled designers and craftsmen are employed in the production of the Humber Car.

Because the speed of building is only consistent with the time required for the out-turn of a car that has made the name of Humber synonymous with reliability.

Because it **is** a

AIRSHIPS IN PEACE AND WAR.

Contributed by Airships, Ltd.

THE HISTORY OF AIRSHIPS, LTD.

Airships, Ltd., came into existence in February, 1914, under the managing-directorship of Mr. G. Holt Thomas, who has always been a great believer in the future of lighter-than-air craft, and who was largely responsible for reviving official interest in the subject at a critical period in the early days of the war. This faith has found the most complete justification in the indispensable work since performed by airships.

Shortly after its formation the company acquired the British rights of the famous Astra-Torres Airship Co., of Paris. Two airships of the Astra-Torres type supplied to the British Admiralty were used very effectively in patrolling the Channel and in escorting the transport steamers which carried the first British Expeditionary Force to France in August and September, 1914.

In 1915 it became apparent that the use of submarines by Germany to destroy merchant shipping would create a considerable danger to British food supplies, and that this menace could only be encountered by more intensive patrol of home waters. Airships were considered the most promising means of achieving this result with a minimum of delay.

At the suggestion of Mr. Holt Thomas an envelope belonging to the small airship "Willows No. 2" (named after its constructor, Mr. E. T. Willows, who was at that time connected with the firm) was, in conjunction with a standard aeroplane fuselage, used as an experimental scouting craft.

On trial this airship gave excellent results, and was, in fact, so satisfactory that orders were placed for a large number of similar ships. Several of these were delivered by Airships, Ltd. They were called the S.S. ("Submarine-Searcher" or "Sea-Scout") class, since popularly known under the pseudonym—"Blimps."

The S.S. airship having filled, or at least giving definite promise of filling, the pressing need for aerial scouts to patrol the seas in the narrow waters of the English Channel and at other important strategic points, it was considered necessary to extend the process, from a limited number of bases, along the whole coast-line and further out to sea. This could only be done by craft having wider range of action and therefore, necessarily, of greater capacity.

For this purpose the Astra-Torres design of envelope was considered to be particularly suited. An envelope having a capacity of 4,000 cu. metres was, therefore, supplied by Airships, Ltd., and provided with a car of novel, but effective, construction. This airship became the prototype of the C.P. ("Coastal Patrol") airships of which a large number were placed in commission during the succeeding year. Modified airships of the same general type—known as the C ("Coastal") and C* ("Coastal Star") classes, having capacities of 170,000 cu. ft., and 200,000 cu. ft., respectively—and all built upon the Astra-Torres system—were subsequently produced.

The C.P., C, and C* airships proved thoroughly satisfactory and carried out very valuable work within the limits of their range. For naval operations upon a grand scale, however, it was necessary to have a still greater range of action, and with this end in view a class of airship having a capacity of 360,000 cu. ft.—also of Astra-Torres design—was constructed. These airships, which proved to be the most effective non-rigid craft ever produced by any nation, were capable of considerable speed and long duration. Their operations could be extended many hundreds of miles from their bases.

The serviceability of these airships, as shown by their performances under most exacting war service conditions—referred to more particularly upon a later page—cannot but be appreciated. The continued adherence of the Admiralty to the Astra-Torres design, through many successive stages of development, shows very clearly the esteem in which the system is held.

Airships, Ltd., have also been very extensively engaged in the manufacture of captive balloons. Spherical balloons were used for observation in the early stages of the war, and were produced by the firm in large numbers, including one having a capacity of 150,000 cu. ft.—the largest spherical balloon ever produced in this country.

Owing to the difficulty of taking accurate observations from spherical balloons, especially in windy weather, the more stable kite-balloon made its appearance at an early stage of the war. The manufacture of these was taken up extensively by the company. At the end of the war Airships, Ltd., were the largest manufacturers of kite-balloons in Great Britain. Kite-balloons of all types have been built, commencing with the "Drachen," and passing through several intermediate types to the Caquot R and M types which have now become the standard balloons for all military and naval observation purposes. Altogether a total of over 1,000 envelopes were produced during the period of the war.

The workshops at Merton, where the envelopes and suspensions are made, are perfectly equipped with the latest machines and appliances. Upwards of one thousand skilled fabric workers and riggers are employed therein. Similarly, the workshops at Hendon are equipped for the manufacture of the planes, rudders, car structures, engines, propellers, etc.

An experimental laboratory provides facilities for testing material and parts, and the company is fortunate in possessing a 7-foot wind-tunnel built upon modern and approved lines. This tunnel enables the wind resistance of airships and parts (represented by scale models) to be measured with extreme accuracy, and experiments relating to aerodynamic stability to be readily performed. It would be difficult to over-estimate the assistance which the designing department receive from constant and intimate contact with practical experiments of this character.

THE USES OF AIRSHIPS.

To those who have been unable to keep in touch with the development of airships during the war, the publication of figures showing the vast amount of flying which has been carried out by lighter-than-air craft, must have afforded considerable interest and food for thought. The impression still exists, even among many who are interested in aviation, that the airship is a frail and impractical craft, incapable of facing average weather conditions and of taking its place beside the aeroplane in the world of Aeronautics. This impression has been fostered by the secrecy which has until recently surrounded the work of Service airships, aided to no small extent by the fact that the operations have been carried out mainly at sea.

The exigencies of war have proved that airships are capable of performing many useful functions which cannot be conveniently or economically carried out by water-borne craft or safely attempted by seaplanes. They have, in fact, a wide field of utility which does not overlap those of the foregoing types of craft.

FACTS AND FIGURES.

During the war the aggregate time spent in the air by British airships was upwards of 80,000 hours, and the total distance covered approximately 2,300,000 miles. These figures speak for themselves as to the utility of airships.

A British Non-Rigid Airship (N.S.7), built on the Astra-Torres principle.

In illustration of the amount of work which may be carried out by one airship, it may be mentioned that one non-rigid ship was in actual commission for a period of two years and seventy-five days. During that time 2,500 hours were spent in the air, and the total mileage flown was 66,000, equal to more than two and a half times the circumference of the globe.

TYPES OF AIRSHIPS.

Airships as constructed to-day fall into two main classes known respectively as the "Rigid" and "Non-Rigid" types. Rigid construction is usefully applicable only to airships of the largest size, that is to say, to those having capacities of a million cubic feet or more. The non-rigid type, at the present stage of development, includes examples ranging from very small two-seater craft up to sizes having a capacity of nearly half a million cubic feet.

When transport by air becomes a regular feature of the world's commerce it is extremely probable that the longer journeys will be carried out almost exclusively by means of large rigid airships, which even at the present stage are capable of carrying heavy loads over distances sufficient to link up the Continents.

THE FUTURE OF AIRSHIPS.

Although the development of airships has been greatly expedited by urgent necessity arising out of a state of war, the airship is not essentially or exclusively an instrument of warfare. In all probability time will prove the airship, like the steamship, to have a wider and more general application to the arts of peace than of war. Attention is drawn to a few, out of many, civic and commercial purposes for which small airships may be employed.

ADMINISTRATIVE.

Closely allied to the purposes for which these airships were originally developed is the work of maintaining police supervision over large areas of land and sea.

In undeveloped regions where it is necessary to hold in check troublesome native races, where the nature of the country, forest or mountain, renders it essential that observation, to be effective, should be carried out near the ground, and from a craft able to remain practically stationary where required—conditions which cannot be met by aeroplanes—and where, moreover, the absence or scarcity of landing grounds renders the use of aeroplanes dangerous and impracticable, the airship is particularly adapted.

Similarly, territorial waters containing fisheries may be effectively protected, by the establishment of an airship patrol, against illicit exploitation by unauthorised persons.

When used for purposes such as the above, the airship—after the usual manner of police organisations—would be lightly armed for moral rather than material effect. The purpose of the craft would be preventive rather than punitive, and the mere presence of the airship would, in most instances, achieve the desired result.

In computing the advantages of using airships for patrol work of the above kind, it should be remembered that an area of half a million square miles can be kept under observation from a single airship base, and any given part of that area may be visited between dawn and dark of an average day.

MARINE SALVAGE.

The phenomena which renders it possible from a height to distinguish objects beneath the surface of the sea or reposing upon the sea-bed, where the depths are not excessive, can be made use of in combination with the ability of an airship to move slowly or remain stationary over a given spot. Used in this way, an airship should be of the greatest value in locating sunken vessels and in facilitating the execution of salvage operations.

For the above and kindred purposes it is extremely desirable that all maritime and colonial nations should possess at least one or two small airships. This policy has already been adopted by important overseas dominions.

SURVEYING AND PROSPECTING.

For the purpose of carrying out survey or prospecting work in undeveloped tracts of country the airship is particularly suited. The ability to move slowly or remain stationary as mentioned above, and to operate in safety at low altitudes, confers upon the airship unrivalled advantages as a platform for optical or photographic observation.

COMMERCIAL USES.

DELIVERY OF MAILS, NEWSPAPERS, ETC.

One of the most important conditions affecting the financial success of any commercial undertaking employing aircraft for transport purposes is the existence, over the chosen routes, of a regular and sufficient volume of traffic. In this respect the carriage of mails and newspapers is nearest to the ideal.

It is not suggested, however, that aircraft can compete with railways where such exist, but there are many parts of the world where railways are either non-existent or have to be supplemented by other slower and more expensive means of transport in order to fulfil the needs of agriculture or mining districts consisting of a large number of widely scattered settlements. In such districts a general business in the transport of parcels and passengers forms a valuable addition to the regular contract work of carrying mails, etc.

The question as to whether aeroplanes or airships should be used for the foregoing purposes would depend largely on local conditions. Apart from these it may perhaps be stated very generally that, while the initial outlay and cost of upkeep are greater with airships than with aeroplanes, the running cost per ton of load carried is considerably less. Consequently where exceptionally heavy traffic over long distances has to be dealt with, the advantage is entirely with the airship.

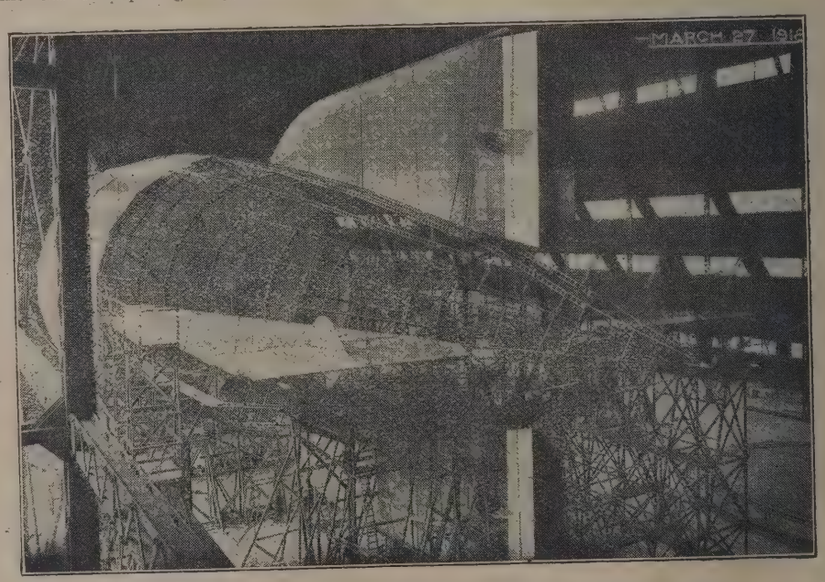
PASSENGER SERVICES.

For purely passenger work, where other means of transport are unavailable and where speed is not a decisive factor, the airship is generally to be preferred. It gives a feeling of greater security to the average person, and can therefore command patronage from a much wider section of the public.

In an airship comfort can be provided. The interest of journeys may be enhanced by travelling at low altitudes, which enables local objects to be distinguished and prevents the scenery from being robbed of its beauty by the flattening effects of great elevation.

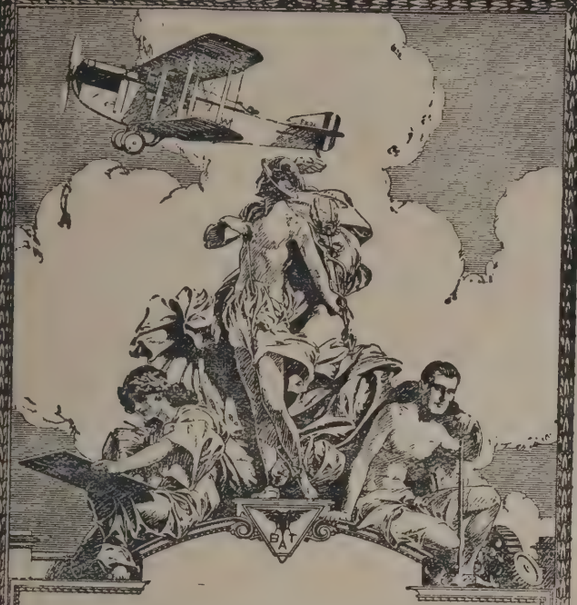
Pleasure trips from inland centres of population to seaside places and short cruises from health resorts where a large number of pleasure-seekers are congregated in a limited area during the holiday season and are prepared to pay relatively high rates for the novelty of travelling in the air can be made to provide profitable employment for airships of moderate size.

PRIVATE OWNERSHIP.



An airship can be suitably constructed and fitted out as an air-yacht, with comfortable state-rooms and appointments to form an excellent alternative or auxiliary to the ordinary yacht. The cost of such a craft compares very favourably with that of a steam-yacht, and would not be prohibitive to those who normally indulge in yachting as a pastime.

PREPARATIONS FOR THE FUTURE.



In view of the facts set out above, Airships Ltd. are preparing designs for a series of airships designed to meet the various purposes to which such aircraft may be immediately applied.

The series will range from ships of approximately 400,000 cubic ft. capacity capable of carrying 30 passengers for 800 miles non-stop at 50 m.p.h. down to a ship of more or less the "Blimp" type of 70,000 cubic ft. capacity, capable of carrying a crew of three for six hours' flight at 48 m.p.h., which, converted to the requirements of private ownership, would be eminently suitable for use as a small air yacht.

Airships Ltd. are therefore in a position to supply anyone who is considering the use of airships of small or moderate size for any commercial or private purposes with estimates and designs for types suitable for such use.

The Tail of R31 under construction at Short Bros.' Works, Bedford.

UTILITY AIRCRAFT

THE aim behind all BAT aircraft designs is the attainment of maximum utility—it is to obtain superior speed, load carrying capacity, safety, reliability, and general airworthiness with a minimum of prime cost and subsequent maintenance.

Our range of models covers all types from the mosquito craft of extreme performance and attacking power for national defence, to the high speed load carrier designed for postal and general utility purposes.

Any Government or commercial undertaking intending to employ aircraft should place their requirements before the B.A.T. Company before finally deciding on the type to adopt.

THE machine illustrated above is the B.A.T., F.K. 26—a dual purpose aeroplane equally suitable as a heavy load mail carrier or a four-seater touring machine. Equipped with a Rolls-Royce Eagle VIII. motor, an average speed of over 120 miles per hour is obtained at a fuel cost of under eightpence per mile.

THE B.A.T. Company whose designing capacity under the direction of Mr F. Koolhoven is of the highest standard — a standard which it is determined to maintain—is open to negotiations for the letting of its sole manufacturing licenses in Colonial and certain foreign territories.

Fullest particulars can be obtained, and demonstrations arranged, by application to:—

BROOKS
Featherweight Aero Cases
for personal or other luggage

The smaller of the two cases illustrated is 20 by 10 by 8 inches, and weighs 4 lbs. The larger one is 26 by 16 by 6 inches, and weighs 6 lbs. 4 oz. only.

THEIR foundation of 3-ply wood and covering of fine quality grained Leather Cloth give to them both strength and attractive appearance. The larger sizes have solid Leather Corners, whilst those of the smaller ones are specially reinforced. One or two locks are fitted according to the dimensions of the case (and clips when necessary). The cases are lined inside with Satin Cloth, tight or padded to order. At the moment we can only supply in black.

THE LIFT OF HYDROGEN.

By P. L. TEED (MAJOR, R.A.F.).

The term, "Lift," as applied to airships is equivalent to "buoyancy," and like buoyancy when applied to water-borne ships, it depends on two considerations:

(1) The weight of the ship.
(2) The weight of supporting medium displaced by the ship.

Here the analogy between water and air-borne craft ceases. For, in the case of water-borne ships (other than the submarine), a condition of equilibrium always prevails; if the weight of the ship is increased its displacement is increased, the water line being altered, but a state of equilibrium continues.

The airship, being entirely surrounded by the supporting medium, has no equivalent to the alteration in water-line producing equilibrium. With change in weight of the displaced supporting medium the airship may possess either positive or negative buoyancy.

While the structural weight of the ship remains constant, the weight of medium displaced by the ship is subject to considerable variation.

The following affect the buoyancy:—

(1) The volume of gas in the airship.
(2) The purity of the gas.
(3) The barometric pressure of the air.
(4) The temperature of the air.
(5) The amount of water in the air.

Of the five matters affecting the lift of an airship apart from its volume, the purity of the gas is generally to be taken as the most significant factor, but the combination of temperature and barometric pressure may produce even more important variations.

The maximum purity of hydrogen in an airship does not exceed 98 per cent. by volume, while certain chemical considerations necessitate the deflation of the airship at 80 per cent. by volume.

Under mean atmospheric conditions, viz., temperature 55 deg. Fahrenheit and barometer 29.5 in., the lift of 1,000 cubic ft. of hydrogen at 98 per cent. purity is 69.3 lb., while under the same atmospheric conditions at 80 per cent. purity it is 56.6 lb.—a variation of 12.7 lb. per 1,000 cubic ft. of volume.

Now turning to purely atmospheric effects, 1,000 cubic ft. of 98 per cent. pure hydrogen at a barometric pressure of 31 in. and at a temperature of 20 deg. Fahrenheit gives a lift of 78.3 lb., while an equal volume of gas of the same purity at a barometric pressure of 28 in. and a temperature of 80 deg. Fahrenheit gives a lift of 62.8 lb., a variation of 15.5 lb. per 1,000 cubic ft. of volume.

Having illustrated the variations in lift due to purity and to atmospheric changes, it is perhaps permissible to state that while the lift of 1,000 cubic ft. of hydrogen 98 per cent. pure at a temperature of 20 per cent. Fahrenheit and under a barometric pressure of 31 in. is 78.3 lb., the lift of 1,000 cubic ft. of hydrogen 80 per cent. pure at a temperature of 80 deg. Fahrenheit and under a barometric pressure of 28 in. is 51.2 lb.—a variation of 27.1 lb. per 1,000 cubic ft., which represents the extremes of purity and atmospheric conditions which may easily be met with.

Having dealt with the general principles of lift and illustrated its variations by some examples, the question will now be dealt with in detail.

PURITY OF THE GAS.

It is customary to give the chemical composition of the hydrogen in an airship as so many per cent. pure. This term requires definition.

By the percentage of purity of hydrogen is meant the percentage of hydrogen contained by volume assuming the impurity to be of the same density as air.

Now it will be seen that if the impurity in the hydrogen is air, then since air in air is without weight, the relative lift of equal volumes of impure hydrogen under the same atmospheric conditions is in the same ratio as their hydrogen contents (by volume).

To sum up.—Lift of unit volume is directly proportional to purity.

ALTERATION IN LIFT BY BAROMETRIC CHANGE.

One thousand cubic ft. of pure hydrogen at 30 in. barometric pressure and a temperature of 40 deg. Fahrenheit weighs 5.5 lb. One thousand cubic ft. of dry air under the same atmospheric conditions weighs 79.6 lb. Therefore, on the basis lift is the difference between displaced weight and displacing weight:—

$$79.6-5.5 \text{ lb.} = \text{Lift of cubic feet of pure hydrogen at } 30'' \text{ barometer and } 400^\circ \text{ Fahrenheit,}$$
$$= 74.1 \text{ lb.}$$

Now assume that the temperature remains constant but that the barometer changes to 31 in. Then by the application of Boyle's Law it will be seen that:—

$$79.6\times 31-5.5\times 31 = \text{Lift per 1,000 c.f. of 100\% pure hydrogen at } 31'' \text{ barometer and } 40^\circ \text{ Fahrenheit.}$$
$$= 82.3-5.7$$
$$= 76.6 \text{ lb.}$$

But the above is an unnecessarily complicated way of arriving at the desired result, for the mathematical expression may be simplified to:—

$$= \frac{\frac{31}{30}(79.6-5.5)}{30\ (74.1)} = \frac{31}{30\ (74.1)}$$
$$= 76.6 \text{ lb.}$$

But 74.10 lb. is the lift of 1,000 cubic ft. of hydrogen 100 per cent. pure at 30 in. barometer and 40 deg. Fahrenheit. Therefore the rule may be expressed:—

Lift of unit volume is directly proportional to barometric pressure.

ALTERATION IN LIFT BY THERMOMETRIC CHANGE.

By the direct application of Charles' Law it can be shown that:

Lift of Unit Volume is inversely proportional to the Absolute Temperature.

To summarise the three rules which have already been stated:—

(1) Lift of unit volume is directly proportional to PURITY.
(2) Lift of unit volume is directly proportional to BAROMETRIC PRESSURE.
(3) Lift of unit volume is inversely proportional to ABSOLUTE TEMPERATURE.

From the above the following formula may be deduced to give the lift of 1,000 cubic ft. of hydrogen under any condition of purity, temperature or barometer:—

Lift per 1,000 cubic ft. in lb.—

$$\frac{74.06 \times \%\text{Purity} \times \text{Barometer in inches} \times 500.}{100 \times 30 \times (460 \text{ plus temperature in deg. Fahrenheit}).}$$

$$\frac{12.34 \times \%\ \text{Purity} \times \text{Barometer in inches.}}{460 \text{ plus temperature in deg. Fahrenheit.}}$$

THE TEMPERATURE OF THE GAS.

In the formula which has been given it has been assumed that the temperature of the gas is the same as the temperature of the air—a condition which generally prevails in the airship shed, but during flight there is frequently a material difference in temperature between the two. This difference arises in two ways:—

(1) The effect of the sun on the gasbag.
(2) The effect of a quick descent after flying for a considerable time at a high altitude.

In the first case the sunlight striking the gasbag fabric causes this to rise above the air temperature, the heat being in course of time transferred to the gas itself. The gas then expands in accordance with Charles' Law. Now in rigid airships if the gasbag is not full, or in non-rigid airships if there is air in the ballonets, this expansion will cause a greater volume of air to be displaced and consequently an increase in lift to take place.

For example:—At 40 deg. Fahrenheit and 100 per cent. purity 1,000 cubic ft. of hydrogen weighs 5.5 lb., and 1,000 cubic ft. of air under the same atmospheric conditions weighs 79.6 lb. Hence the lift per 1,000 cubic ft. is: 79.6—5.5 lb. = 74.1 lb.

Now assume that the temperature of the gas rises to 50 deg. Fahrenheit. Its volume instead of being 1,000 cubic ft. will be:—

$$\frac{1{,}000 \times 510 \text{ cubic ft.}}{500}$$
$$= 1{,}020 \text{ cubic ft.}$$

But its weight is still 5.5 lb., although the weight of air displaced is not the same; for instead of 1,000 cubic ft. being displaced, 1,020 cubic ft. are displaced, which weigh:—

$$\frac{79.6 \times 1{,}020 \text{ lb.}}{1{,}000}$$
$$= 81.2 \text{ lb.}$$

So the lift of the original 1,000 cubic ft. of gas becomes:—

$$= 81.2-5.5 \text{ lb.}$$
$$= 75.7 \text{ lb.}$$

This alteration in lift by difference in temperature of the gas may at first sight appear to be of mere academic interest, but in large airships this is certainly not the case.

Take the case of a Zeppelin of 1,250,000 cubic ft. maximum capacity containing only 1,000,000 cubic ft. of hydrogen. The ship is flying in equilibrium when the sun comes out and causes the gas temperature to rise from 40 deg. Fahrenheit to 50 deg. Fahrenheit. Then, as has already been seen, the lift of the gas is increased 1.6 lb. for every thousand cubic ft. of gas in the ship at 40 deg. Fahrenheit; but the volume of the gas was assumed to be one million cubic feet; therefore the lift of the ship will be increased:—

$$1{,}000 \times 1.6 \text{ lb.}$$
$$= 1{,}600 \text{ lb.}$$

This alteration in lift during flight in large airships is of considerable importance, and it is consequently necessary that the pilot should always be acquainted with the relative temperature of the gas and air, for which purpose electric thermometers are now fitted inside one of the gasbags recording in the car.

THE AMOUNT OF WATER IN THE AIR.

Though it may not appear of importance, the humidity of the atmosphere has a certain effect on the lift of hydrogen. The greater the amount of water vapour in the atmosphere the less the weight of unit volume of air, consequently the less the lift of unit volume of hydrogen, for the difference between displaced and displacing weight is less.

This alteration in lift due to humidity is not very material, as it does not generally cause a difference in lift of more than 0.3 lb. per 1,000 cubic ft. of gas. However, in the case of "Lift Trials" some adjustment must be made for humidity of the atmosphere. This adjustment can most easily be made by observing the difference in temperature between the wet and dry thermometer and then employing an empirically compiled table which gives the necessary adjustment per 1,000 ft. of gas.

THE LIFT OF AIRSHIPS.

So far the lift of hydrogen and the phenomena which affect it have only been dealt with. Now the lift of airships will be considered. Before dealing with this, two terms require definition :— one, Available Lift; the other, Disposable Lift.

Available Lift.—Available Lift is the total lift of the gas in the airship.

Disposable Lift.—Disposable Lift is the difference between the available lift and the fixed weight of the airship.

The Disposable Lift is that buoyancy which is available for carrying fuel, oil, crew and ballast.

As will be seen, both the available lift and the disposable lift will vary with temperature, barometer, humidity and purity. Consequently a custom has originated in classifying airships on their available lift, assuming the ship to be 100 per cent. full, with hydrogen 95 per cent. pure, the barometer being 29.5 in., the thermometer 55 deg. Fahrenheit, and the air dry.

From the formula for lift already given, it can be calculated that the lift of gas under these conditions is 67.2 lb. per 1,000 cubic ft. Thus the tonnage of existing classes of English airships are :—

S.S.Z. $\frac{70 \times 67.2}{2,240}$ Tons = 2.1 Tons.

C.P. $\frac{185 \times 67.2}{2.240}$ Tons = 5.55 Tons.

N.S. $\frac{360 \times 67.2}{2,240}$ Tons = 10.80 Tons.

In building airships their disposable lift under the conditions of purity, humidity, barometer and temperature already mentioned is generally specified, but when the disposable lift is taken practically, it is improbable that all, if any, of the specified conditions exist; consequently the practically obtained figure must be converted by simple mathematics to what it would have been had the conditions of the specification prevailed.

To convert disposable lift from one set of conditions to another the following must be known :—

(1) Disposable Lift on the occasion of the trial.
(2) Temperature on the occasion of the trial.
(3) Purity of Gas on the occasion of the trial.
(4) Barometer on the occasion of the trial.
(5) Humidity of the air on the occasion of the trial.
(6) Volume of the gas, or fixed weight of ship on the occasion of the trial.

To take an example, let it be assumed that by practical trial 9 tons was found to be the disposable lift of a million cubic ft. airship, 100 per cent. full of hydrogen 98 per cent. pure, when the barometer was 30 in. the temperature 40 deg. Fahrenheit, and the humidity of the atmosphere negligible. It is required to know what would be the disposable lift under the generally specified conditions, namely 100 per cent. full of hydrogen, 95 per cent. pure, when the barometer is 29.5 in., the temperature 55 deg. Fahrenheit, and the humidity negligible.

The first thing to be done is to determine the total lift on the occasion of the practical trial.

By means of the Lift Formula already given, determine the lift per 1,000 cubic ft. of gas on the occasion of the trial. This will be found to be :—72.6 lb. per 1,000 cubic ft. Now the volume of the ship is known to be one million cubic ft.

Therefore $\frac{72.6 \times 1,000}{2,240}$ tons is the available lift,

$= 32.4$ Tons

Now the disposable lift of the ship was, by trial, 9 tons.

Therefore 32.4—9.0 tons is the weight of the ship = 23.40 tons.

Now by means of formula determine the lift per 1,000 cubic ft. of hydrogen under the conditions of the specification. This will be found to be :—67.2 lb.

Therefore under the conditions of the specification

$\frac{67.2 \times 1.000}{2,240}$ tons is the available lift,

$= 30.0$ Tons

But the fixed weight of the ship was found to be 23.4 tons.

Therefore 30.0—23.4 tons is the disposable lift under specified conditions = 6.6 tons.

In the example which was taken the volume of the ship was known but not its fixed weight. Now let it be assumed that the weight was known but not the volume. Under these circumstances, if in other respects the same problem was to be solved, the procedure would be :—

Determine the lift per 1,000 cubic ft. on the occasion and circumstances of the trial. This would be 72.6 lb. per 1,000 cu. ft.

Now the weight of the ship was known to be 23.4 tons.

Therefore 23.4 plus 9 tons is the available life of the ship = 32.4 tons.

Therefore $\frac{32.4 \times 2240}{72.6}$ thousand cubic ft. is the volume of the ship.

= 1,000 thousand cubic ft. or 1,000,000 cubic ft.

Occasion may arise when it is desired to know the disposable lift of an airship when the conditions of the specifications do not exist and neither the volume nor the weight of the ship is known.

Let it be assumed that on the occasion of the practical trial the disposable lift was found to be nine tons when the ship was 100 per cent. full of gas of 96 per cent. purity, and the barometer was 29.8 in. and the temperature 30 deg. Fahrenheit.

Determine the lift of 1,000 cubic ft. of hydrogen under these circumstances by formula. It will be found to be 72.2.

When this has been done, it is necessary to wait until some of the conditions have altered. Assume on a later occasion that the ship is 100 per cent. full with hydrogen 95 per cent. pure, when the barometer is 28.5 in. and the temperature 60 deg. Fahrenheit. Take the disposable lift, which for purposes of argument will be assumed to be five tons.

Then work out the lift per 1,000 cubic ft. of hydrogen under the conditions prevailing.

This will be found to be 64.4 lb. per 1,000 cubic ft

Between the first and the second trial the disposable lift has altered from nine tons to five tons, and the lift per 1,000 cubic ft. from 72.2 to 64.4 lb.

Now, the difference per 1,000 cubic ft. in lift on the two occasions is : 72.2 — 64.4 lb.

= 7.8 lb.

The difference in disposable lift, 9 — 5 tons

= 4 tons = 8,960 lb.

Therefore, since the fixed weight of the ship has remained constant, $\frac{8.960}{7.8}$ is the volume of the ship in thousands of cubic ft :—

= 1,148.7 thousand cubic ft. or 1,148,700 cubic ft.

The volume being now determined, from the methods already described it is possible to calculate the disposable lift under any conditions whatever.

To summarise, the following are necessary for the conversion of disposable lift :—

Under conditions of lift trial :—

Available lift 100 % full — disposable lift found = fixed weight.

Under conditions to which disposable lift is to be converted :—

Available lift 100 % full — fixed weight = disposable lift.

THE "MAORI 4" SUNBEAM-COATALEN AIRCRAFT ENGINE.

As is fairly well known, the Sunbeam-Coatalen engines, in addition to the work which they have done in aeroplanes, have also been largely used in British airships.

R34 and her sister ships are equipped throughout with the "Maori 4" Sunbeams—which is thus the first aero-engine to have made the return trip from Europe to America and back.

This type of engine is illustrated on page 728, and the following specification gives all its main features.

12 cylinders.
100 m/m bore by 135 m/m stroke.
60 degrees Vee.
4 overhead valves per cylinder.
2 overhead camshafts per block of cylinders, driven by a train of gears.
Volume of cylinders ; 12,270 ccs.
Direct drive to propeller shaft. A flywheel is also fitted to these engines.
Articulating connecting-rod system.
Normal revolutions 2,100 per minute.
275 B.H.P. at normal revolutions of engine.
Approximate weight per h.p. : 3.3 lbs.
4 Claudel Hobson carburetters B.Z.S. 38.
Pressure feed to carburetters.
Ignition is by two 12-cylinder magnetos.
A hand starter and electric starter are fitted.
The exhaust pipes are provided with a special arrangement for water cooling.
The water pumps are of specially large dimensions, and a governor is fitted to the engine to prevent over-running. When the engine speed reaches 2,500, the governor automatically comes into operation, and similarly when the oil pressure falls below 20 lbs. per square inch.

III.—FRENCH AIRSHIPS.

A French C.M. Class Airship. The arrangement of the tail is characteristically French.

MILITARY AIRSHIP FACTORY (Chalais Meudon).

Construction on a large scale both of non-rigid airships and kite balloons has been undertaken by the Chalais-Meudon establishment, in addition to experimental work and tests.

During the first three years of the war, airships were built for the French Army alone. Notable among these vessels are the "Lorraine" and "Tunisie" (1916), of about 10 tons displacement, and the "Capitaine Caussin" (1917), of nine tons. In their general features, these airships are akin to Zodiac practice of the same period.

The Zodiac system of rigging has been adopted, comprising an external girdle along both sides of the envelope and tangential cables to the car.

In each case the car is short, and constructed of steel tubing. Twin propellers are mounted upon brackets on opposite sides, driven by engines enclosed in the car, through shafts and bevel reduction gears.

Pressure in the envelope is maintained by a power blower in the car, from which air passes up to the ballonets through a vertical pipe.

CHARACTERISTICS.

	"Lorraine" & "Tunisie" (1916).	"Capitaine Caussin" (1917).
Capacity	370,000 cubic ft.	312,000 cubic ft.
Length	305 ft.	267 ft.
Width	50 ft.	46 ft.
Engines and h.p.	2 220 h.p. Clement Bayard	2 240 h.p. Canton Unné
Gross lift	10.6 tons	9.2 tons
Disposable lift	4.4 tons	4.9 tons
Maximum speed	43 m.p.h.	50 m.p.h.
Crew	5	6

THE "T" CLASS.

Following upon the "Capitaine Caussin" in 1917 appeared a smaller type of airship, known as the T.

Six vessels at least were produced of this pattern and taken over by the Navy for anti-submarine patrol duties.

The envelope form of the T class is distinguishable by its extremely high fineness ratio—in the order of 8 : 1. In conjunction with the manner of rigging the car, a short one, close under the envelope, this long envelope must certainly involve the use of an inordinately high internal gas pressure to keep it in alignment. Consequently, the envelope fabric must be heavy, and this is probably the chief reason for the fact that the ratio of disposable lift of this type is low.

The car is streamlined, constructed of duralumin, and provides good protection for the crew. The two power units installed are Salmson Canton Unné engines of 160 h.p. As they are of radial type, it has been possible to economise space and weight by embodying the engines in the framework on opposite sides of the car, each engine facing outboard and driving through shaft transmission and bevel reduction gearing a two-bladed propeller.

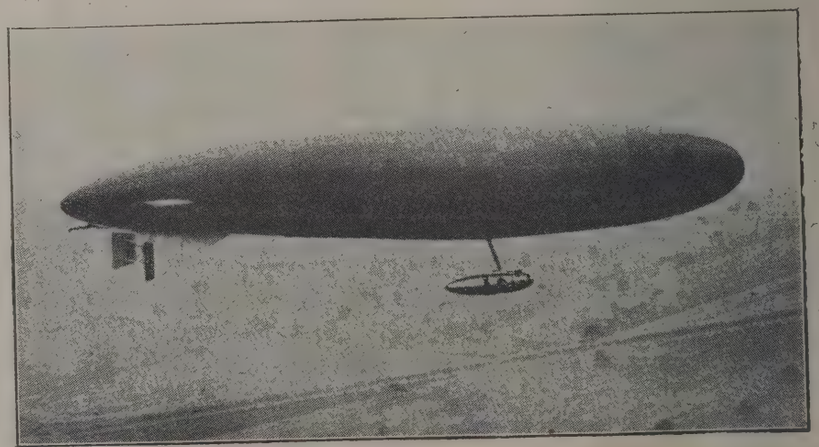
CHARACTERISTICS.

Capacity	194,000 cubic ft.
Length	230 ft.
Overall width	46 ft.
Engines and h.p.	2 160 h.p. Canton-Unné
Gross lift	5.4 tons
Disposable lift	1.7 tons
Maximum speed	50 m.p.h.
Crew	5

THE C.M. CLASS.

A non-rigid airship of medium size on the same general lines as the T class, but with a shorter envelope of more conventional shape. The C.M. class was specifically designed for submarine hunting, and towards the end of the war appears to have become the standard French airship for sea patrols.

The car is constructed of duralumin, and is carefully faired throughout. In this respect the method of mounting the twin Canton-Unné engines flush with the sides of the car is noteworthy.



The propellers, carried on outrigger brackets on each side, are driven through bevel gearing by shafts directly coupled to the engines.

A Q.F. gun of light calibre is mounted forward.

Biplane horizontal fins are attached to the tail of the envelope, and a large triangular fin below forms the foundation for the "box" type elevator and rudder control surfaces.

CHARACTERISTICS.

Capacity	176,500 cubic ft.
Engines and h.p.	2—160 h.p. Canton-Unné.
Gross lift	5.2 tons.

A French airship of the "T" class notable for the fineness of its lines.

The WHEELER
Pocket Height and Weather Indicator

For Aerial Passengers.

THIS instrument is designed for use of aviators. It indicates the exact height at which the Aeroplane is flying and is of great **interest and value to all who fly.** Furthermore it has the additional advantage of indicating the weather for general use—it is, in fact, a pocket barometer. The instrument is made in watch form, gilt or oxydized case, and supplied in solid leather outer case in a secure and convenient form for the coat pocket.

Two sizes: Diameter 1⅞" Diameter 2¼"

Aircraft and motor accessory firms are invited to apply for terms.

Can be supplied with luminous dials if desired.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

Disposable lift .....1.8 tons (est.).
Maximum speed .....52 m.p.h.
Crew .....5.

THE ASTRA CLASS.

Astra Société de Constructions Aeronautique, 13, Rue Couchot and 121, Rue de Bellevue, Billancourt, Paris.

British representative: "Airships, Ltd," 47, Victoria Street, London, S.W.

This firm was founded by M. Surcouf for the production of ordinary balloons. Constructed early Lebaudys, later Astras, and finally the Astra-Torres type, noted principally for the unique trefoil section of the envelope.

Large vessels built by the firm have been used during the war by the French Government. Vessels with one and two cars have been constructed, of which details are available concerning the sister ships "Alsace" and "Pilatre de Rozieres," built in 1915.

In general appearance these airships are similar to the British N.S. Class.

CHARACTERISTICS.

Capacity .....495,000 cubic ft.
Length .....295 ft.
Diameter .....54 ft.
Engines and h.p. .....2 220 h.p. Chenu.
Gross lift .....14.2 tons.
Disposable lift .....6.5 tons.
Maximum speed .....40 m.p.h.
Cruising speed .....80 m.p.h.
Crew .....6.

LATER TYPES.

Two later types of Astra non-rigid airships of smaller volume were constructed in 1917 for anti-submarine operations. The first vessel of this new series was reported to have a capacity of approximately 210,000 cubic ft. and two 170 h.p. Renault engines.

The second type was somewhat larger, with a capacity of 234,000 cubic ft., giving a total lift of 6.7 tons and a disposable lift of 2.4 tons. With two 200 h.p. Hispano-Suiza engines, this type of airship attained a full speed of 50 m.p.h. and an endurance of 10 hours.

CLEMENT-BAYARD CLASS.

Usines Clement-Bayard, quai Michelet, Levallois-Perret (Seine). (Seine).

The principal products of this firm, before the outbreak of war, were large non-rigid airships, with streamlined shaped envelopes from which was suspended a girder nacelle of great length intended to distribute the load.

ZODIAC CLASS.

Société Francaise des Ballons Dirigeables et d'Aviation Zodiac, 10, Route du Havre, Puteaux, Seine.

The Zodiac Company maintained a fair output of successful airships during the war period.

Two non-rigid airships, built to the order of the French Army during 1915-16, are notable as being the largest non-rigids constructed in recent years. They are the "D'Arlandes" and "Champagne," each of 530,000 cubic ft. volume. When the French Military Airship Service was disembodied, these vessels passed to the Naval authorities.

The Car of a French C.M. Type Airship. The mounting of the Salmson engines should be noted.

A distinguishing feature of Zodiac design is the method of attaching the car suspension cables to the envelope by means of long reinforced fabric girdles attached to the envelope on both sides. Considerable success has been achieved in rigging the car close up to a long, finely streamlined gasbag, despite the natural difficulties of this system. Gas pressure is doubtless high.

The stabilising surfaces of the Zodiac closely resemble those of the productions of the Chalais-Meudon establishment, illustrated in the photographs of the C.M. type airships. In brief, the arrangement consists of a large vertical fin below the tail, carrying box elevators and rudders, with one or more small supplementary horizontal fins attached to the sides of the envelope immediately above.

All Zodiac airships are equipped with a power-driven blower in the car to maintain pressure in the internal ballonets. An air duct, of large diameter, through which the air passes from the car to the envelope, is a recognisable feature of the make.

"D'ARLANDES" AND "CHAMPAGNE."

CHARACTERISTICS.

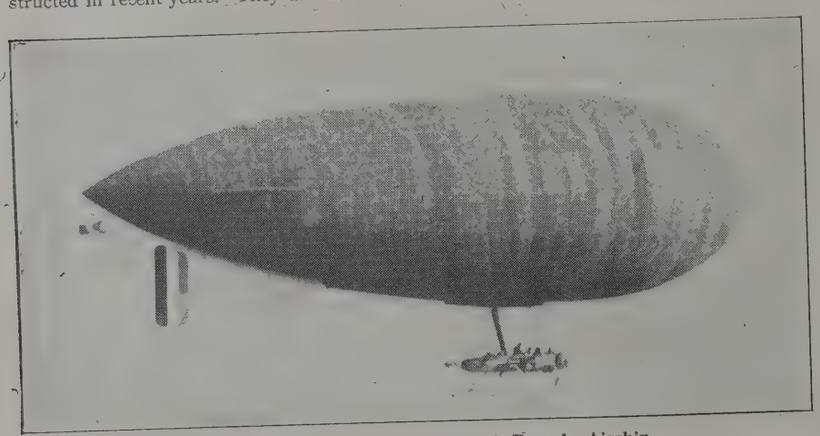
Capacity .....530,000 cubic ft.
Length .....335 ft.
Diameter .....49 ft.
Engines and h.p. .....2 220 h.p. Zodiac
Gross lift .....15.2 tons
Disposable lift .....7 tons
Maximum speed .....43 m.p.h.
Cruising speed .....32 m.p.h.
Crew 6

LATER TYPES.

"VEDETTE ZODIAC" (1916).

Capacity .....77,600 cubic ft.
Gross lift .....2.23 tons
Engines and h.p. ..... 2 70 h.p. Anzani
Maximum speed (about) ..... 50 m.p.h.

"VEDETTE ZODIAC" (1917).



Capacity .....97,000 cubic ft.
Engines and h.p. .....2 60 h.p. Renault
Gross lift .....2.8 tons
Maximum speed (about) .....50 m.p.h.

"ECLAIREUR ZODIAC" (1917).

Capacity .....219,000 cubic ft.
Engines and h.p.
2 220 h.p. Hispano-Suiza
Gross lift .....6.3 tons
Maximum speed (about) .....50 m.p.h.

"CROISEUR ZODIAC" (1917-18).

Capacity .....430,000 cubic ft.
Length .....31 ft.
Diameter .....50 ft.
Engines and h.p. .....2 225 h.p. Zodiac
Gross lift .....13.3 tons
Maximum speed .....47 m.p.h.

The "Eclaireur Zodiac" type of French Airship.

A Steel that hardens True

Edgar Allen's standardized oil-hardening steel is the enemy of distortion. It practically eliminates expansion or contraction due to hardening, and is uniform in grain and composition. These properties make it specially suitable for tools of extreme accuracy.

Edgar Allen's

K.9

Oil-hardening Steel

can therefore be used with confidence for Dies, Stay Taps, Milling Cutters, Plugs, Gauges, and Master Tools. A small piece for trial purposes will be sent free, on receipt of a request stating the name of the firm.

Write for K.9 Folder

which reproduces an untouched photograph of a fracture, showing the fine grain and uniformity of this steel. Instructions for hardening are also given.

IV.—GERMAN AIRSHIPS.

One of the German Zeppelins of the "Height-climbing" class. The peculiar painting should be noted. This ship is black below to reduce the effect of searchlights from below and white above to reduce the heating effect of sunshine.

NOTE.—A total of about 120 airships are believed to have been constructed by the Zeppelin Company for the German Army and Navy, and about 20 by the Shütte-Lanz Company for the Navy. The German Military Airship Service was disbanded probably during the summer of 1917, and the few Zeppelins that it then possessed passed to the control of the German Admiralty.

The year 1918 was disastrous to the Naval Airship Service, for in addition to war losses, including the practical extinction of Tondern Station by British aeroplanes and the destruction on her first war flight of the L70, their latest and best vessel, involving the death of Captain Strasser, the Leader of Airships (Fuhrer der Luftshiffe), six Zeppelins of a new type were destroyed by an explosion at Ahlhorn. Thus it happened that at the time of the Armistice only nine airships—all Zeppelins—were in commission and on the active list.

In the stress of the last few months of Germany's war effort, the production of new vessels appears to have been reduced, but that the Germans had by no means lost faith in rigid airships is shown by the fact that designs had been prepared for Zeppelins of much larger size and greater capabilities than any others yet constructed.

The capacity of these vessels would probably have been somewhere in the region of 5,000,000 cubic feet, and the "ceiling" of the projected vessels would undoubtedly have been very much higher than the 22,000 feet already attained. It is therefore possible that raiding might have again become a practical proposition, though this work was never regarded as the primary function of the German Airship Service—sea reconnaissance was the most important of its duties.

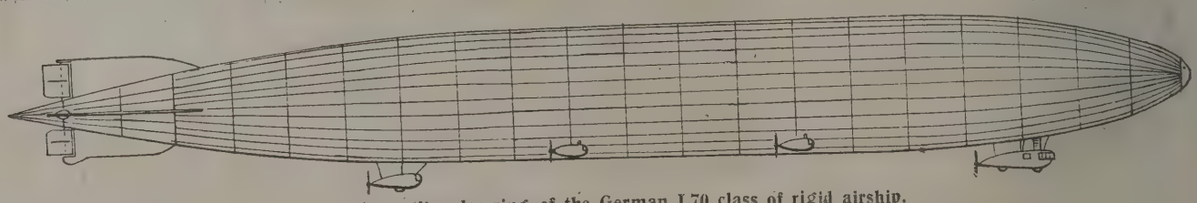
ZEPPELIN CLASS.

The Zeppelin airship in commission at the close of hostilities belonged chiefly to what is known as the long-range class, with the possible exception of one or two training airships, and the L71, which was the second vessel recently constructed of a new and improved class. Included with the training ships may have been the famous L14, on which many notable Zeppelin pilots learned their art, a vessel built in 1915 that established a tradition of its own for charmed longevity, and was still heard of well towards the end of the war.

From the appended table of dimensions and performance may be gathered the progress of Zeppelin development from L1 to L70 of the naval classes, and the following notes furnish additional particulars of the airship latterly employed.

ZEPPELIN L40 (HEIGHT-CLIMBING) CLASS.

Airships of this class were constructed in 1917. The capacity (2,000,000 cu. ft.), overall dimensions, and general arrangement were almost identical with those of the previous L30 Class, and, as these features also recur, without material variation, in the British R33 Class, a detailed enumeration is unnecessary.



With the object of saving weight, however, many improvements were introduced in the construction of the hull, and it may be said that the process of lightening was carried to such a point that these airships were capable of the highest performance with safety only at great altitudes where the aerostatic and aerodynamic forces experienced are less—e.g., at roughly 16,000 feet the principal stresses on a rigid airship are nominally halved.

The truss system of stiffening the main circumferential girder frames was modified and lightened and minor economies in weight were effected wherever possible. The gondolas were made considerably smaller and more attention paid to reducing their air resistance by streamlining. This development applied principally to the forward gondola, but it was also evidenced in the wing gondolas, as is shown in the accompanying photographs of the wreck of the L49.

The engines installed were five 240 h.p. Maybachs distributed as in the case of R33—one in the aft section of the forward gondola, one in each of the twin "wing" gondolas, and two in the sternward gondola. A full speed of 62 miles per hour was attained by these airships, which were capable of a static climb to 21,000 feet. In the raids on Britain a load of bombs was carried amounting usually to about 2½ tons.

ZEPPELIN L57 (LONG-RANGE) CLASS.

These airships, commissioned late in 1917 and early in 1918, probably comprised L57 to L65, and were 50 ft. longer than the above-mentioned L40 class, but not otherwise dissimilar in general appearance.

An outline drawing of the German L70 class of rigid airship.

MINIMUM COST

H. M. HOBSON, LTD., 29, Vauxhall Bridge Road, London, S.W.1.

The gas capacity was increased to 2,200,000 cubic ft. and the extra lift so secured, supplemented by a further addition in disposable lift effected by certain improvements in design, resulted in a better all-round performance.

Four streamlined gondolas, similar to those of the "height-climbing" class, were fitted, but in place of the 240 h.p. Maybach engine the newly-developed 300 h.p. engine of the same make was adopted, five engines being installed as before. Thus the power was increased to a total of 1,500 h.p. and the speed to 65 miles per hour.

Many long flights were accomplished by Zeppelins of this class, including an attempt to fly from Jamboli (Transylvania) to East Africa with 12 tons of medical stores. The airship was ordered back by wireless and landed at her base after covering about 3,000 miles.

ZEPPELIN L70 CLASS.

Two vessels of a new type, L70 and L71, were commissioned in 1918, L70 meeting destruction by British Naval forces in August of that year. They were the largest, most powerful, and most efficient airships ever built. Possibly L71 may fly again under another flag.

In size these airships retained the same dimensions as their predecessors of the "long-range" class, the length being 693 ft., diameter 79 ft., and capacity 2,200,000 cubic ft. The gross lift was 66.64 tons, and the disposable (useful) lift 38.84 tons, which, although this type of craft was very heavily engined, amounted to more than 58 per cent. of the total lifting capacity.

The design, whilst displaying no fundamental departure in principle from precedent, represents the highest standard of development yet achieved. It was the product of 12 years of effort on the part of the Zeppelin designers.

A point of recognition was the number of the gondolas, of which there were six, an addition of two "wing" gondolas, making four in all, having been occasioned by the greater number of engines installed, as compared with former classes.

The gondolas thus comprised one double gondola forward containing, in separate sections as is usual, the controls, W/T and an engine, an after gondola containing the auxiliary control position and two engines, and four "wing" gondolas, each with one engine, arranged in two pairs spaced at equal intervals intermediately.

The engines, seven in number, were the Maybach 300 h.p. type, giving a total of 2,100 h.p., with which a full speed of 77.6 miles per hour was obtainable.

Flying at an economic speed of 45 miles per hour, the L70 class of airship was capable of cruising for nearly eight days, covering 8,000 miles in still air.

THE DEVELOPMENT OF NAVAL ZEPPELIN AIRSHIPS, 1912-1918.

In the following table an attempt has been made to demonstrate the progressive growth in size and performance of the Naval types of Zeppelin airships.

A considerable number of Military airships and a few passenger models were produced in the early days of development, with a consequent diversity of characteristics.

As, however, the Naval models during this period were generally similar in dimensions to their contemporaries, it is convenient to confine the figures to the Naval types, as representative of the whole.

Information concerning certain of the Naval series is scanty, and various recorders of Zeppelin data give divergent figures in some instances. There is no means at the present of securing absolute accuracy, and therefore certain of the values in the table below may be incorrect. Generally, they can be accepted as being not far from the mark, erring, if at all, on the side of underestimation.

	1912 L1.	1913 L2.	1914-15 L3—L8.	1915 L11—L19.	1916 L20—L24.	1916 L30—L39	1917 L40—L56	1918 L57—L65.	1918 L70

V.—ITALIAN AIRSHIPS.

NOTE.—The majority of the Italian airships are officially designed and built, or procured, by the "Stabilimento Construzioni Aeronautica" at Rome, which is the aircraft factory of the Italian Government, and provides airships and kite balloons to both the Naval and Military authorities. The official designs emanate from the Institute Centrale dell' Aeronautica adjoining the works.

It is necessary to explain that the semi-rigid in Italy has been developed on two distinct principles. Firstly, there is the official design, having as its characteristic a keel composed of a number of separate rectangular sections, constructed of steel tubing, which are ball-jointed together so that the whole is free to bend in a vertical plane, whilst constituting a beam for the purpose of distributing the suspended weights of the car evenly along the envelope.

The correct shape of the envelope in this design is partially dependent upon internal gas pressure, but the head of pressure necessary is very considerably less than in a non-rigid airship. Consequently, a lighter fabric can be used, and, in the aggregate, sufficient weight may be saved to compensate for the weight of the keel system.

The second principle is represented by the Forlanini and in lesser degree by the Usuelli. In these airships the keel is a rigid beam which distributes the suspended weights in a similar manner. The Forlanini design has merit in this respect, but it lacks the advantages derived from the flexibility of the official type.

STABILIMENTO CONSTRUZIONI AERONAUTICA.

Four primary classes of airships (excluding the D.E. class) were projected—viz., the Piccolo (P)—small Medium, (M)—medium, the obsolescent Veloce (V)—fast, and the Grande (G)—large. The latter, a proposed rigid airship, was abandoned during the war, and a large semi-rigid, known as the A class, was introduced in its stead.

GRIPOLY BELTING

An Italian Ship of the "M" Class.

P and P-VELOCE CLASSES.

These are old and obsolescent airships, now mostly used for instruction. In general appearance they are similar to the D.E., M and V types, and represent the intermediate size between the two first-mentioned models.

The P is the earliest of the official Italian designs. Two 75 h.p. Fiat engines are installed, which are usually carried on outrigged bearers like those of the S.S. Twin. With these engines a speed of 40 m.p.h. is obtained.

The P-Veloce is the same type of airship fitted with two 225 h.p. Fiat engines. As it attains a maximum speed of 56 m.p.h., it is the fastest of all Italian airships, except, perhaps, the latest Forlanini vessels. Its range of action is limited.

CHARACTERISTICS.

(Common to P and P-Veloce).

Capacity	176,500 cubic ft.
Length	203 ft. 6 in.
Width	39 ft.
Height	70 ft. 6 in.
Gross lift	5·4 tons
Crew	3

M CLASS.

During the war the M type has undergone considerable modification, and the following notes must be taken to refer to the improved type now being built with two, three, and perhaps four engines. Two engines apparently constitute the standard.

The envelope is divided by diaphragms into six gas chambers, each fitted with two valves. A ballonet extends internally from the bow to near the tail, and is joined to the lower part of the envelope on either side of the keel. At the forward end the ballonet encloses a valve in the extreme nose, the entrance of air being regulated by shutters on the principle of a Venetian blind.

Perforated diaphragms are inserted in the ballonet. Whilst permitting air to pass, these serve to check the tendency of the air to surge towards the lower end when the airship is inclined.

The keel (sectional hinged type) is attached at the bows to a radial nose-stiffening framework, and at the stern forms the foundation for the attachment of a large vertical stabilising fin and the control planes. A narrow fin is attached to the top of the envelope.

The weight of the car is communiated from the keel to the envelope by means of parabolic wires sewn into the envelope between each keel-joint. Also, circumferential bands pass round the envelope at each of these places, and internal wires connect the keel to two longitudinal canvas girdles along the top of the envelope—producing a small lobe in the centre.

A gun platform is provided above the bows.

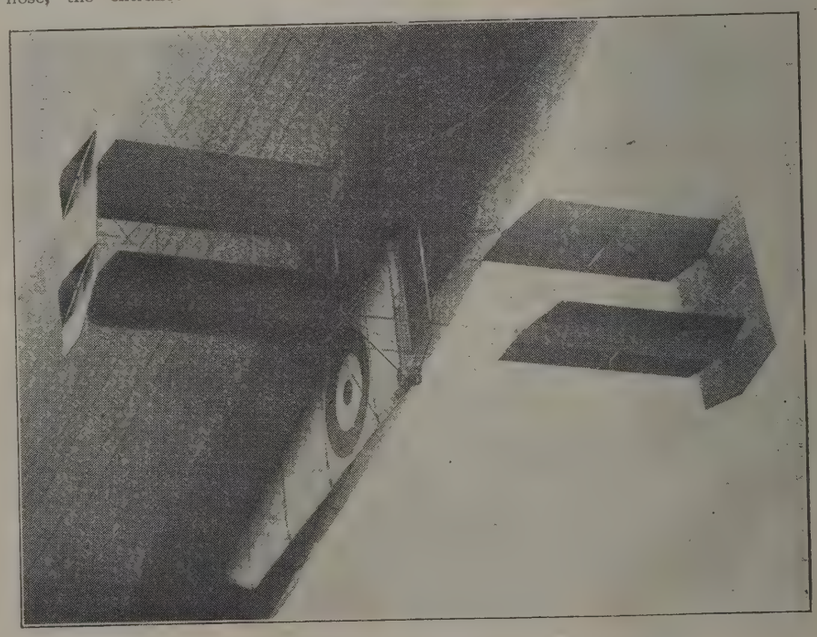
The car is short and bulky. Two engines are carried in bearers on the sides of the car, each driving a propeller at the rear through long shafting. These propellers are of variable and reversible pitch. In certain of the illustrations of an M-type car, a third engine is shown mounted on a gantry above the others.

CHARACTERISTICS.

Capacity	441,000 cubic ft.
Length	265 ft.
Width	59 ft.
Height	89 ft.
Engines and h.p.	2 280 h.p. Itala
Gross lift	13.8 tons
Crew	5

V CLASS.

Following the advent of the M class, a limited number of larger semi-rigids were built to a new design, known as the V. It appears that the development of this type has lapsed, and some of its proved good points have been incorporated in a revised model of the M.

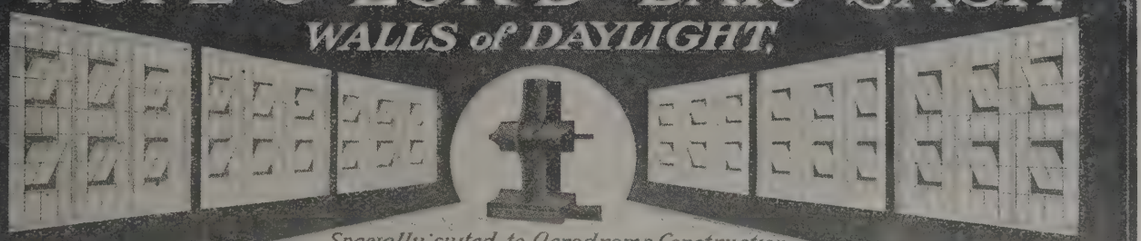


The V is distinguishable from other Italian airships of the official series by the absence of a long, single vertical fin below the keel. In lieu thereof it has two small triangular fins and larger vertical control planes. A long top fin is also fitted.

CHARACTERISTICS.

Capacity	553,000 cubic ft.
Length	287 ft.
Width	62 ft. 4 in.
Engines and h.p.	4 130 h.p. Itala
Gross lift	17 tons
Maximum speed	51 m.p.h.

D.E. CLASS.



The Dirigible Exploratore type of semi-rigid airship was produced chiefly for submarine hunting, and corresponds in size and functions with the British S.S. Zero type. It is interesting as demonstrating that the semi-rigid prnciple can be success-

An Italian Airship of the "Dirigible Exploratore" Class.

fully applied to an airship of so small a capacity as 100,000 cubic ft.

The envelope is divided by fabric diaphragms into four gas compartments, to reduce the loss of gas in case of localised damage. One long air-ballonet extends along the inside of the envelope, above the keel. A shutter valve in the nose of the airship (where pressure is relatively high) admits air to the ballonet.

At the after-end of the keel is attached a long stabilising fin, which forms the perpendicular of a number of triangular frames. The control planes are of "box" type, fitted at extremity of this fin.

In each of the above features, the D.E. is representative of the officially designed types.

The car is short and, although roomy, appears to afford little comfort for the crew. A Fiat engine of 100 h.p. is mounted on a gantry above the car, and drives directly a propeller of conventional pattern.

CHARACTERISTICS.

Capacity	92,000 cubic ft.
Length	159 ft.
Width	34 ft. 6 in.
Height	55 ft. 9 in.
Engines and h.p.	1 100 h.p. Fiat
Gross lift	2.8 tons
Maximum speed	42.5 m.p.h.

FORLANINI CLASS.

Manufacturers: La Società Leonardo da Vinci. Offices: Via Baccacio 21, Milan.

Although limited in number and use, the semi-rigid airships built by the Società Leonardo da Vinci, near Milan, to the designs of Enerico Forlanini, have developed very considerably in size and capabilities during the war. The latest projected model, when completed, will be the largest airship, other than of the rigid type, in existence.

Generally, the following characteristics are typical of all airships of Forlanini design:—

A rigid triangular steel girder constructed of light steel tubing, lattice fashion, extends internally from end to end, along the bottom of the envelope.

The gas is contained in a compartmented gasbag (usually with 12 gas chambers) from which the lift is transferred directly to the top of the keel girder evenly along its length. The whole is surrounded by an outer cover of silk, and the ring space between the inner and outer envelopes constitutes the air ballonet of the airship. Air enters through a valve in the nose.

The car is attached rigidly to the keel, and encloses the control cabin and two or more engines. Two variable pitch propellers are mounted on brackets on the sides of the car and driven through shafting and bevel gears.

A peculiar feature is the installation of a small air compressor actuated by shafting from the engines. From a receiver, air is available at different pressures for operating the gas valves, for the petrol system and for inflating the bumping bags under the car.

In the case of the F3, it is stated that biplane elevators are fitted on the sides of the car to increase the dynamic lift of the airship. The "box" control planes of this vessel comprise ten rudders and eight elevating planes attached to a large fin below the tail end of the keel.

Characteristics of Forlanini Airships.

An indication of the development of the Forlanini vessels from the beginning is furnished by the following table:—

VI.—UNITED STATES AIRSHIPS.

A United States Naval Airship of the "B" class.

NAVAL AND MILITARY

A large number of non-rigid airships of diverse types were constructed in America during the last year of the war, mainly for the purpose of submarine hunting. The designs were prepared by the Bureau of Construction and Repair, Navy Department, and contracts placed with the Goodyear Tyre and Rubber Company, Akron, Ohio; the B.F. Goodrich Company, Akron, Ohio; and the Connecticut Aircraft Corporation. Since the declaration of armistice it has been announced that the American Navy will continue to devote money to the development of lighter-than-air craft, and proposals have been published for the construction of three or four rigid airships and a considerable number of new non-rigids.

In addition, the Balloon and Airship Division of the Department of Military Aeronautics contemplates the building up of a fleet of small, single-engine airships of the non-rigid type, which it is intended to use for fire control work, and also in connection with coast fortifications and military liaison duties.

An initial order for six airships of about 75,000 cubic ft. has been let, one half in the U.S.A. and the others in Europe.

COMMERCIAL.

Various schemes are on foot to start the construction of commercial airships, but nothing definite has as yet been accomplished.

The Goodyear Tyre and Rubber Company have completed the designs for a 750,000 cubic ft. airship of the semi-rigid type, reminiscent of Forlanini practice, which is to be 400 ft. long, 65 ft. in diameter, and is to be driven by two 450 h.p. engines. Accommodation is provided for twenty-four passengers, and the endurance at 60 m.p.h. is estimated at 2,000 miles. This ship has been designed for trans-continental transport.

The Connecticut Aircraft Corporation have tentative plans for the construction of a 300,000 cubic ft. airship of the non-rigid type, with belly-band rigging. This airship is to accommodate twenty passengers, and be fitted with two engines totalling 400 h.p. A maximum speed of about 60 m.p.h. is expected. The engines will be located in separate cars, rigged forward and aft, while the passenger car will be located amidships.

The B.F. Sturtevant Company, which has had some experience with light structures by building vanadium steel aeroplanes to Grover C. Loening's designs, is investigating the possibility of building rigid airships and operating them for passenger transport between New York and Chicago.

B CLASS (NAVAL).

Submarine Scout Airships.

B1—B33 (1917-1918). Built by Goodyear (24), Goodrich (7), and Connecticut Aircraft Company (2).

A small type of non-rigid airship, proportional in size to the British S.S. class. Capacity, 75,000 to 84,000 cubic ft.

The envelope design is conventional. Tangential rigging is employed for the car suspension, the attachment of the cables to the envelope being effected either by a rigging girder or by finger patches.

Air is supplied to the ballonets by a power blower in the car or, alternatively, by a blower pipe interposed in the propeller slipstream.

The arrangement of the stabilising fins varies. A horizontal fin is attached on either side of tail, and in some ships two vertical fins are placed on the under side; on others, one vertical fin is placed above and one below. All control planes are balanced.

The car follows the lines of a tractor aeroplane fuselage, with accommodation for a crew of two. Floats are provided on the landing carriage to permit of a descent upon water.

Characteristics.

GOODRICH TYPE A. (Rigging by belly-band.)	CONNECTICUT TYPE B. (Rigging by belly-band.)

Static ceiling ..... 7,000 ft.	

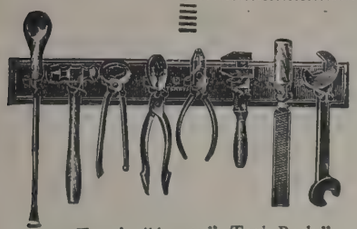
C CLASS (NAVAL).

C1—C15 (1919 and building, nine by Goodyear and six by Goodrich).

Coastal patrol airships designed for escort duties and submarine hunting.

These airships are not remarkable for any particular features, apart from demonstrating the practicability of applying the patch system of suspensory attachment to non-rigid airships of fairly large size. Finger patches are used in the Goodyear airships, and horseshoe patches in those built by the Goodrich Company.

The envelope has the same silhouette as that used for the British non-rigid airships, and is laid out upon analogous lines.

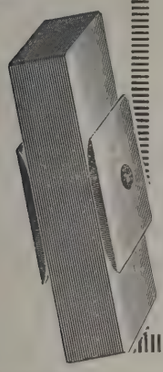


A large car is fitted with two engines mounted upon outrigger bearers towards the forward end, and twin propellers. Ample accommodation for the comfort of the crew is provided.

The air supply system for maintaining pressure in the ballonets consists of two blower pipes in the wake of the propellers. The bore of these pipes appears to be small, in view of the size of the airship, probably indicating a slow rate of descent.

A point of recognition is the large single vertical fin under the hull.

Characteristics.



Volume	170,000 cubic ft.
Length	190 ft.
Width	43 ft.
Height	54 ft.
Total h.p.	300

Rate of climb	1,000 ft. per min.
Static ceiling	8,000 ft.
Complement	4

Description.—Non-rigid type, trimmed by ballonets; external rigging. to finger patch (Goodyear) and horseshoe patch (Goodrich). Designs of the Bureau of Construction and Repair, Navy Department.

E CLASS (NAVAL).

A refinement of the Submarine Scout class of small non-rigid airship. Actual figures as to the size of this type are not available, but it is presumed to be about 100,000 cu. ft.

The design of the envelope and the system of car suspension is based upon standard practice.

A point of interest is the large area of the balanced rudder and elevators, the shape of which is also distinctive. A top fin is fitted.

An air blower pipe in the slipstream of the propeller conveys air to the ballonets, and for use in emergency a power-driven blower is installed in the car.

The car has clean lines and is arranged much in the same way as a "pusher" aeroplane nacelle. An undercarriage, equipped with floats, is fitted at the after end, and under the nose of the car there are two small bumping bags

The engine is a 150 h.p. Thomas.

OTHER COUNTRIES.

Beyond the nations hereinbefore mentioned none have carried out any airship work of note.

Japan is known to have possessed at one time a curious experimental airship of native design, and it is distinctly likely that during the late war she may have acquired small airships of Allied make and have reproduced them.

Otherwise, so far as can be discovered, the rest of the world has been absolutely inert in the matter of airships.

An Airship of the U.S. Navy's E class.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

NOTES OF THE WEEK.

GREAT BRITAIN.

THE OFFICIAL VISIT TO HOLLAND.

Sir Frederick Sykes, K.C.B., C.M.G., Controller-General of Civil Aviation, left Felixstowe for Amsterdam on Aug. 12th by flying-boat. The boat arrived at Amsterdam after a flight of one hour 55 minutes.

Sir Frederick officially visited the Amsterdam Aircraft Exhibition, and was received by General Snyders and the British Chargé d'Affaires, Mr. Robertson.

The following officers were among those who accompanied Sir Frederick in four other flying-boats:—Colonel Waterhouse, Major Bernard, Major Leslie, Major Clayton, Captain Burling, Captain Nowall, Captain Faux, Captain Mackworth, Lieut. Walsh, Lieut. Snelgrove, and Lieut. Tapper.

Although the boats had not flown the Atlantic the crews were entertained at an official lunch, and later at an official banquet. Despite this fact they were able to fly home two days later.

Sir Frederick and his party left Amsterdam at noon on Aug. 14th, and arrived at Felixstowe at 3.30 p.m.

THE LONDON-PARIS AIR SERVICE.

If the Civil Aviation Department gives permission in time, the Aircraft Transport and Travel, Limited, will start a daily aerial service to Paris on Aug. 25th, weather permitting.

The machines used will be of two types, the D.H.4a and the D.H.16, both with limousine fuselages. The former will carry two and the latter four passengers. Accommodation will be provided for one handbag per passenger. The machines will leave at 12 noon in each direction, weather permitting, and the average time of flight is estimated at 2¼ hours.

Parcels will be carried at 7s. 6d. per lb., but if arrangements are made to carry them regularly a substantial reduction to 3s. 9d. per lb. is made.

They will be accepted at the American Express Company, 6, Haymarket, S.W.1, till 10.30 a.m. daily, and at the Hounslow aerodrome till 11.30 a.m. daily.

Passengers and parcels will be taken in a motor from the company's office to Hounslow, and they will be similarly conveyed from the Le Bourget aerodrome to the Place de l'Opéra, Paris, and vice-versa. At first only one machine per day will make the journey each way, and therefore tickets must be secured in advance at the American Express Company or at any of the aerial booking agencies. The price for the single fare is twenty guineas.

Although the service is an experimental one, it will be continued for at least six months, and at all events much valuable experience will be gained. Both types of machines to be used have a cruising speed of 100 m.p.h. The Aircraft Transport and Travel, Limited, are out to prove that a small machine with a high speed is of very much more use in commercial flying than a large machine with larger capacity but a comparatively slow speed.

According to the "Times" of August 19th, Farman machines are to be used on a weekly service entirely for passengers. Carrying twelve passengers, they will fly from London on Thursdays and return from Paris on Fridays. If the demand requires it, further flights will be made.

The first ticket for the first trip has been sold by the Lepaerial Travel Bureau to Mr. Pinoli, the restaurateur.

FOR CLOSER ALLIANCE.

Waring and Gillow, Ltd., who control the Alliance Aerodrome Company, contemplate opening up aerial communication between their various houses upon the Continent and elsewhere. The London-Madrid flight was the initial trip.

A NEW AGENCY.

The London agency of the United Aircraft Engineering Corporation has been established at 123, Pall Mall, S.W.1. The president of the Corporation, Mr. F. G. Diffin, paid a short visit to this country for the purpose of establishing the agency, and has now returned to the United States of America.

The London agency recently purchased from the Disposal Board 98 D.H.6 machines with 90-h.p. Curtiss engines, and these are being offered for sale. A representative of THE AEROPLANE was informed that negotiations are now being made, but that so far no important sales have been completed. The price asked for the machines is in the neighbourhood of £300 each. Some of them may be exported.

It has been reported in the Press that a number of these machines have been sold to a concern called "The Yellow Taxi Co.," of Chicago. The report is unconfirmed, but it ought to be true.

The United Aircraft Engineering Corporation, which has its headquarters at 52, Vanderbilt Avenue, New York, has been in existence for the last two or three years, and has done much work in the construction of aerodromes, planning of aerial routes, and so on. At the end of this year the Corporation will begin the manufacture of aeroplanes and engines, which so far has not been undertaken.

A FALSE REPORT.

It was announced in the "Morning Post" last week that the Handley Page Company will start a regular passenger service between London and Amsterdam. Inquiries made by THE AEROPLANE show that this announcement is incorrect. Probably it is due to a misunderstanding as the Handley Page Company had under consideration the scheme of running a daily service between London and Amsterdam for visitors to the Amsterdam Aero Show. The scheme was dropped, however, when it was discovered that the aerodrome at Amsterdam was unsuitable for the purpose.

AN AERIAL TOUR.

A large Handley-Page machine left Cricklewood on August 17th with seven passengers. The pilot is Major Tryggve Gran, a pre-war aviator and Antarctic explorer. The passengers are his wife, Capt. Steward, Capt. Meisterlin, a representative of the Royal Aero Club, and two mechanics.

At a height of 10,000 to 13,000 ft. they crossed the Channel and landed at the Soesterberg Aerodrome, near Amsterdam, for lunch. They left there at 4.30 p.m. and landed on the Danish island of Langoland at 10 o'clock, where they spent the night.

At 8.30 a.m. on August 18th they proceeded to Copenhagen, where they arrived at 9.30 a.m. (75 miles). They were received with great enthusiasm by an enormous crowd.

After a stop at Copenhagen for a few days they intend flying to Christiania and Stockholm and back to England *via* the North Sea.

FREE FLIGHTS.

The "Daily News" is offering 175 free flights on Saturday, August 23rd, at the following places:—Cricklewood, 100; Southend and Hastings, 20 each; Great Yarmouth, 15, Cowes, Isle of Wight, and Paignton, 10 each.

On Monday, August 25th, they offer 15 free flights at Derby.

The flights at the Isle of Wight were postponed on Saturday, August 16th, until Tuesday, August 19th, on account of the weather.

BEXHILL.

On August 12th, Major Fowler, of the Eastbourne Aviation Company, who was flying with a passenger in a seaplane, saw a girl bather in difficulties in the sea. He went to her assistance and brought her safely to shore.

BLACKPOOL.

Flying has proceeded as usual at Blackpool during the past week. The weather has been ideal for the "wakes" and large crowds gathered daily to watch the machines. The Avro five-seaters are doing the bulk of the work. The passengers seem to prefer these to the tandem seater.

BRIGHTON.

One five-seater Avro and two three-seaters made 70 flights during the week, ending Aug. 17th, taking up 172 passengers.

HARROGATE.

An Airco D.H.4a and a D.H.6 are taking up passengers at Harrogate, where joy-riding is quite a popular pastime.

HERNE BAY.

On the afternoon of Wednesday, Aug. 13th, an Avro machine flew from Margate to Herne Bay, where passengers were taken up. In future a machine will be available there twice a week on Wednesdays and Thursdays.

LONDON.

CRICKLEWOOD.—Handley Page, Limited, have now taken up nearly 3,000 paying passengers.

HENDON.—A D.H. 10a with Liberty engines, piloted by Capt. Gathergood, flew to Amsterdam on Aug. 14th.

It is now announced by the proprietors of the London Aerodrome that the Hendon-Brighton-Hendon Air Race arranged to

take place on August 30th and the Hendon-Manchester-Hendon Air Race arranged to take place on September 20th have been postponed. The new dates will be announced later.

HOUNSLOW.—The following cross-country flights were made in Avros during the week ending Aug. 17th:—Two each to Brighton and the Isle of Wight, and one each to Chatham, Hamble and Swansea. The machines made return journeys on every trip, except on that to Swansea. A five-seater Avro went to the Eastney Fair for four days and took up 388 passengers.

An Avro machine loaded with sixty brace of grouse was flown from Perthshire to Hounslow on August 12th in eight hours. The grouse were served at dinner the same night at Prince's Hotel, Piccadilly.

A Vickers-Vimy aeroplane carrying twelve passengers flew from Amsterdam to Hounslow on August 15th in three hours.

MARGATE.

A total of 232 passengers was taken up at Margate for the week ending Aug. 17th. Among the passengers was Dame Stancombe Wells, who is well known in Ramsgate. As several people desired to be flown to Folkestone, the Avro management arranged the trip.

NOTTINGHAM.

The big flying scheme for taking up between 2,000 and 3,000 passengers at Nottingham in the middle of September is maturing. The proceeds are to go to a local charity. It is intended to use "the Forest" in the centre of the city for the flights, which are being arranged jointly by Sir Jesse Boot and the Avro Co.

SOUTHAMPTON.

The Supermarine flying-boat daily service from Southampton to Bournemouth, which has been running for some weeks, was officially opened by the Mayor of Southampton on Saturday, August 16th. The mayor and other prominent Corporation members were given flights from the Royal Pier, Southampton Water.

SWANSEA.

During the week ending Aug. 17th, three three-seater Avros made 136 flights and took up 258 passengers. A daily flight was instituted to Llanwrtydd Wells. The machine lands in the grounds of the Abernant Hotel and takes up passengers during the day.

VENTNOR.

On August 12th the motor-launch service run by Messrs. Spencer Bros. was held up, owing to shortage of petrol. A supply of "Shell" was conveyed in a Supermarine flying-boat, enabling the service to be continued.

WESTON-SUPER-MARE.

One Avro machine took up 228 passengers for the week ending Aug. 17th.

A good many "would-be" passengers were disappointed on account of the numbers wishing to fly. A three-seater machine will be available this week, and will relieve the pressure somewhat.

WINDERMERE.

The Avro seaplanes have been very busy during the week, taking up passengers for two guineas a flight round the Lake. A trip of 15 minutes is given, that is about 10 minutes in the air, and four or five minutes on the water, as they do not rise or alight on the "Narrows" in front of the shed, owing to the crowded state of the water there.

The class of passengers who come here for flights consider, as a rule, that they get very good value for their two guineas, but one day a cheerful gentleman blew in and said that 10s. 6d. was his price for a flight. When Capt. Pixton told him that it could not be done for that, he expanded a bit and said that he would "gi'e another bob."

IRELAND.

The Great Northern Aerial Syndicate, Limited, of Liverpool, wrote to the Queenstown Urban Council asking to be put in communication with estate agents or landowners at Queenstown with land for sale within two miles of the town. They require 50 acres of land suitable for the accommodation of airships of 310 to 860 feet. Lloyd's List states that the larger airships are for trans-Atlantic service, and the smaller for local service.

CANADA.

Two American aviators, with the first permit ever granted by the Canadian military authorities, flew across the international boundary on July 12th on a visit to the Aerial League of the British Empire at Montreal.

Apropos the way in which aircraft are being used in Australia and Canada for rounding up herds of cattle, V. Steffanson, the Arctic explorer, is in the Canadian Rockies completing his report for the Canadian Government, and obtaining material for his book. On July 15th he was at Vancouver on his way to Banff. The explorer expressed the opinion that the herds of caribou in the northern lands were destined to solve the problem of a cheap and plentiful supply of meat for Canada.

The difficulties of rounding up the caribou in the country are very great, owing to its rough and frozen nature. The flocks could be easily herded by a flying machine of a type suitable for landing on water and snow.

An expedition has set out in a steamer for Battle Harbour, Labrador, with four Canadian training aeroplanes, to survey, explore, photograph and map the approximately two million acres of forest in the territory tributary to Battle Harbour. The boat was expected to leave Port Hastings, Cape Breton, on July 15th.

Capt. Daniel Owen, flying officer, R.A.F., is in charge of the expedition, and in addition to the pilots and mechanics there are wireless operators, surveyors, a naturalist, a medical officer, a surgeon, and a cinematograph photographer.

The base will be established at Battle Harbour, whence the machines will fly in pairs daily over the forests. Photographs will be taken with aerial cameras of the same type that were used during the war.

Estimates of the cost of the future development of the country will be made from the photographs and the data obtained by the surveyors.

The expedition is able to keep in touch with their offices at Boston by the wireless telegraph, and daily reports of their progress will be made. The project is financed by a syndicate of Boston bankers.

The entire aeroplane equipment was purchased from the United Aircraft Engineering Corp. of New York, the concern that recently purchased the entire flying equipment of the Royal Air Force in Canada. It was also noted in last week's issue of THE AEROPLANE that this corporation had bought 700 aircraft engines and a large number of aeroplanes from the Aircraft Disposal Dept., Ministry of Munitions.

Many famous aviators have entered for the New York-Toronto air contest. Among the Canadians are Col. W. A. Bishop, V.C., D.S.O., and Col. Barker, V.C. Col. Barker will fly over Toronto with H.R.H. the Prince of Wales, who is to be the starter. [Or perhaps he will not.—ED.] The race is to be held on August 25th.

CENTRAL AFRICA.

The Congo Mission of the Disciples of Christ have written to The Curtiss Aeroplane and Motor Corporation.

They are thinking of replacing their motor launches with flying boats for communication between their various stations.

They also wrote that small aeroplanes could land in the central streets of the native towns, which are straight, smooth and usually clear of grass and other obstructions, and not less than 100 feet wide.

[With American aeroplanes they would possibly be nearer Heaven, if farther from the Altitude Record.—Ed.]

FRANCE.

On Monday, Aug. 11th, the Farman "Goliath," piloted by Bossoutrot, flew from Paris to Casablanca with eight passengers.

By covering 2,050 kms. in 17 hours 25 minutes without a stop, the "Goliath" claims to have beaten all records for distance and duration for commercial aeroplanes.

In flying over Spain it was necessary to climb to 4,000 metres to get over the Sierra Morena and the Sierra Guadarama ranges.

On the 14th, at 11.30 a.m., the machine left Casablanca for Mogador, (300 kms.), which was reached at 1.20 p.m. It is proposed to complete the flight to Dakkar by night to avoid the disturbed air conditions which prevail in this part of Africa during the daytime.

The "Goliath" reported that she had passed Port Etienne at 3.30 a.m. on Aug. 16th. She then had only 375 miles to cover to reach Dakar. Up to Aug. 19th, no further news had been heard of her.

On August 13th, a Farman "Goliath," known as "Goliath II." (piloted by M. D'Ors), flew from Toussons-le-Noble, near Paris, to Copenhagen. Two passengers, a mechanic, and some diplomatic papers were carried.

A landing was made at Soesterburg, the Dutch military aerodrome, near Utrecht, and the journey was resumed next morning. The actual flying time for the 700 miles was 8¾ hours.

MM. Vaillement and Deniau arrived at Salonika on Aug. 14th, having flown from Marseilles *via* Naples. They left Salonika the following morning for Constantinople, whence they will fly to Cairo.

It is reported that a passenger service between Le Havre and Deauville is being effected by a "Zodiac" airship of 3,000 metres cubic capacity.

GERMANY.

The Deutsche Luft Fahrt Reederei, which started passenger traffic before the war with the Zeppelins Viktoria Luise, Hansa, and Sachsen, will start a regular service between Berlin and Friedrichshafen. On the Swiss lake a Swiss steamship company will run a connecting steamer service.

The voyage is to take seven hours, with a stop at Munich. It is understood that the airships are of a new model built exclusively for peace purposes.

The Hannoverische Waggenfabrik is to start a regular service to the Harz. The service will begin as soon as the works at Gosler are ready.

The Rumpler works in Augsburg inaugurated the first passenger flight in the Bavarian Alps. A regular service is being planned.

The first aerial limousine built by the Deutsche Flugzeugwerke has made its maiden voyage over Leipzig. The passengers are accommodated in an enclosed sound-proof cabin.

HOLLAND.

The Avro "Baby" which won the Sealed Handicap at the Aerial Derby in June has left Hamble for Amsterdam, where it will be exhibited at the E.L.T.A. Aircraft Exhibition. The pilot is Capt. Hamersley. Another three-seater Avro has also left, and Major McMinnies is also taking over a five-seater. This will raise the number of Avro machines at Amsterdam to a total of seven.

According to the "Nieuwe Rotterdamsche Courant" of Aug. 13th, the plans for aviation transport in Holland have begun to materialise. The Vickers Consortium have decided to join the originators of the scheme. The capital is to be 10 million guilders. The new company intends to organise a regular post and passenger inland service, and to connect this with England by means of a seaplane service.

The first projected routes are (1) Flushing-Rotterdam-Hague-Amsterdam-Groningen, (2) Flushing-Hertogenbosch-Arnhem and connections with Germany, and (3) Amsterdam-Utrecht-Arnhem-Maastricht and connections with the South.

The Combine proposes to be ready to start in 1920. The plans include the construction of an aeroplane factory, aerodrome, a flying school, and the necessary roads to connect—by motor-car—with the town or/and railway stations.

The Dutch correspondent of The Aeroplane writes:—

A usually reliable source states that the Dutch Government intends to negotiate for the acquisition of 24 Airco machines.

On July 21st the Nederlandsche Vliegtuigfabrick was founded in Amsterdam. The company proposes to build aeroplanes and make all spare parts, to trade in such aeroplanes, to establish or encourage the establishment of flying schools, aerodromes, landing grounds, and the exploitation of aeronautical exhibitions, etc. The capital is 1,500,000 florins. The director is A. H. G. Fokker.

The Nederlandsche Automobile en Vliegtuigenfabrick is taking a financial interest in the new company, but the works will continue to specialise in building motor-cars, although the Government orders granted to the company, which are at present in hand, will be fulfilled at the Trompenburg works.

It is understood that Mr. Fokker is at present building an entirely new type of passenger aeroplane different from those now in use, which are simply war aeroplanes fitted with seats for passengers.

ITALY.

In the August 6th issue of The Aeroplane it was noted that a Caproni biplane on a flight from Milan to Venice had crashed near Verona on August 2nd. The Italian correspondent of The Aeroplane writes:—

"The only idea now held is that the machine, as the result of overstrain or shock, disintegrated in the air, though the firm point out that the number of passengers (16) was not abnormal. Ocular witnesses, as is usual on these sad occasions, saw everything imaginable happen. The fact that parts of the machine were distributed over a radius of a mile, and that the bodies of the victims were all over the district, one even in the river and another totally missing, points to disintegration at a great height.

"Major Ercole, the new C.O. of the Verona camp, found half the propeller intact on its shaft, which he considers practically disposes of the supposition that an airscrew came adrift and cut up the tail of a fuselage, one of the first asserted causes of the accident. The firm are stated to be holding to the idea that an explosion occurred, though nothing was found singed or burnt."

Mario Stoppani's flight from Madrid to Rome *via* the Gulf of Lyons, Marseilles, Genoa, Pisa and Grosseto, some 1,200 miles non-stop in 11 hours on August 6th was a distinctly good performance. The machine was a SVA with 200 h.p. Spa engine.

Messrs. Nieuport-Macchi's M.1 has a two-storied or floored car. It took up 27 M.Ps. for a cooling trip round Rome the other day. Another member flew in a Sva. The never-contented are complaining that an opportunity was lost because nothing happened.

The Sicilian Auto Club has announced a seaplane competition to be held on September 14th. The route will be Palermo, Milazzo, Catania, Syracuse, Cape Passero, Marsala, Trapani, Palermo.

SPAIN.

Major de Havilland, flying an Airco machine with a Napier Lion engine, arrived in England from Spain on August 13th. He reported very successful demonstration work there, and thinks that there are great possibilities for aerial mail services in that country owing to the indifference of the railway services.

The train journey from Barcelona to Madrid takes twelve to fifteen hours. Major de Havilland flew the distance in 2 hrs. 25 min., and from Madrid to St. Sebastian (train, ten to twelve hours), in 2½ hrs.

SWEDEN.

Prince William of Wied's jewels and other valuables were dropped from an aeroplane in Sweden because the German banks were no longer willing to take the responsibility of keeping them.

According to Reuter, the German Dr. Stockhausen, who picked them up, said that there was no intention of deceiving the Swedish Customs authorities.

SWITZERLAND.

The Swiss aviators, Comte and Mittelholzer, on August 10th made a tour of the Swiss Alps by flying from Schwamendingen, near Zurich, over Lucerne, and the Bernese Alps, including the Finsteraarhorn, Jungfrau, Mont Leone, Mischabel, and Mont Cervin, landing at Lausanne.

In the afternoon they flew over Mont Blanc and the Matterhorn, landing at Bellinzone, and returned to Zurich a few days later, having covered a total distance of 1,200 kms.

The Italian correspondent of The Aeroplane writes:—

At Bellinzona, just over the Italo-Swiss frontier, active work on hangar building is going on. It is said that a service between that town and Zurich is shortly to be started.

A Concours, open to Military pilots only, is being held under the ægis of the Director of Swiss Aviation. The prizes are rich. As the nature of the country requires, attention is chiefly paid to landing manœuvres.

Tests of landing to be made by aviators of different stages of proficiency from the newly fledged to those having more than 10 months' flying experience.

Reports from Germany of go-ahead projects for transporting the Hun all over the land are apparently being taken au-pied-de-la-lettre by the Federal Authorities.—T. S. H.

UNITED STATES OF AMERICA.

When the 27th Division was returning to America on the Leviathan, an Aeromarine flying boat was flown ten miles out to sea and dropped upon the deck pouches containing messages of welcome to the American troops.

This demonstration convinced steamship officials of the practicability of speeding up trans-Atlantic voyages by releasing the ship immediately on loading and not waiting for the ship's papers to be fully prepared. The papers could be dropped onto the ship by an aeroplane when the ship was at sea, and thus many hours could be saved.

The White Star Line interested the U.S.A. Post Office Department, and an official experiment was decided up.

The "Adriatic" left New York for Southampton on Aug. 14th at 12.30 p.m. A flying boat left New York at 1.30 p.m. with 100 lbs. of late mail, caught up the liner and circled over it. A long weighted wire was let out from the flying boat, which manœuvred until the wire was caught by a cable stretched between the masts of the "Adriatic." The machine then dropped the other end of the wire, to which was attached a waterproof bag containing the mail. This fell into the water and was hauled aboard the liner.

The Pacific Aviation Company of San Francisco has established an aerial taxi service on the Pacific Coast.

Five hundred passengers have been carried already on a Glenn-Martin and a Curtiss machine.

The U.S.A. air mail service was placed upon an equal footing with all other means of mail transportation on July 18th.

The Postmaster-General has now fixed the postage at two cents an ounce, the regular postage rate for first class matter.

Arrangements are being made to put on the New York—Washington route the three fastest aeroplanes in the service. These have a capacity for 18,000 letters and a maximum speed of 132 m.p.h.

The New York-Chicago aerial service enables the department to save in train expenses more than twice the cost of the air mail service on that route.

The Curtiss Aeroplane and Motor Corporation has purchased the Atlantic City Airport. The airport is the official flying field of the Aero Club of America, the Aerial League of America, the Pan-American Aeronautic Federation, the Atlantic City Aero Club, and the National Aerial Coast Patrol Commission.

It is the only place in the world affording facilities for land and water aircraft practically in the heart of the city. It is also claimed to be the only flying ground in the world having five and ten kilometre courses marked with regulation towers as required by the International Aeronautical Federation for testing the speed of aircraft.

It has two frontages of 3,400 ft., and has a railway siding within 300 ft. Mr. W. W. Mountain, the vice-president and general manager of the Curtiss Company, has stated that one hundred thousand dollars will be spent to improve the airport and make it "the world's aeronautical show-window."

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

Further Honours for the C.A.S.

Those who take the trouble to study the "London Gazette" will have noticed that Air Vice-Marshal Sir Hugh Trenchard has been gazetted colonel of the Royal Scots Fusiliers. The honour is on both sides—the Royal Scots Fusiliers are honoured by having as their colonel the man whose handling of the Royal Flying Corps saved the British Army, and the Chief of the Air Staff is honoured by becoming colonel of the distinguished regiment in which he served as a subaltern.

A Deserved Reward.

The "Court Circular" of Aug. 12th announced:—

The King has been pleased to signify his intention of conferring a baronetcy of the United Kingdom on the following:—

William Joynson-Hicks, M.P.—Raised 17th and 23rd Service Battalions, Middlesex Regt. Public services.

Though this is ostensibly the reason for the honour thus deservedly conferred on Sir William Joynson-Hicks, one prefers to believe that the real reason is the service which he has rendered to aviation in general and to the Royal Flying Corps in particular by leading the various agitations which led to reforms of various kinds.

All those who have worked with Sir William in the cause of aviation will rejoice at this reward for good work.

Thoroughness.

When Major-General Sir Frederick Sykes was appointed Controller-General of Civil Aviation he expressed his intention of becoming a civilian, knowing as he did that some of the inefficiency of Service offices is caused by the false importance or subordinance given to individuals by a uniform. Sir Frederick has now been gazetted as having been placed on the Retired List of the Army and as having retired from the R.A.F., so that he becomes definitely a civilian in future. At any rate, his thoroughness in divesting himself of both Army and Air Force rank shows that he is very much in earnest.

The Abolition of Control.

Several papers state that all control over Civil Aviation is to be withdrawn, and that the Department of the Controller-General of Civil Aviation is to be abolished. While fully recognising the good work done by Sir Frederick Sykes in drawing up the International Aeronautical Convention, it would be hard to work up any real grief over the demise of his Department so far as the personnel is concerned. Apart from what he himself has done, one cannot trace any good thing which has been done by his Department, and one can certainly trace a good deal of harm. Civil Aviation needs a certain amount of control, but not of the kind from which it has suffered hitherto.

The "Times," which seems to have constituted itself Defender-in-Chief of the Civil Aviation Department, has been publishing a list of its achievements. Among the first of these it places the publication of a map showing the location of aerodromes The accuracy of the work of the Department may be gauged by the fact that it showed Cattewater (Plymouth) as the terminal aerodrome in the West, omitting to mention that Cattewater is a seaplane station.

It is also alleged, in favour of the Department, that 40,000 people have been carried as passengers since the Civil Aviation Regulations came into being. One would be equally justified in claiming that they had been carried *in spite of* the Department.

Canadian Air Board Appointments.

The Air Ministry issues the information that the Canadian Civil Service Commission, Ottawa, state that a Canadian Air Board having been constituted, the following appointments have become available at the following initial salaries:—

	Per annum.
Secretary	$3,000
Supt. of Certificate Branch	3,600
Supt., Government Flying Operations	4,500
Medical Officer	2,400

All salaries are subject to annual increase. These appointtments would be for three years, renewable, and candidates who do not secure appointments may be eligible for other positions under the Air Board, probably including the following:—Assistant Secretary, two Inspectors in the Certificate Branch (one for Pilots and Navigators, and one for Aeroplanes and Mechanics), a Flying Officer in Operations Branch, and an Equipment and Supply Officer in Operations Branch. Candidates selected must be willing to take the air.

Applications should be made to the office of the Director of Air Services, Canadian Air Office, Oxford Circus House, London, not later than Aug. 21st next. Preference will be given to Canadian citizens. Any R.A.F. officer selected must relinquish his R.A.F. Commission on appointment.

A Professorship of Aeronautical Engineering.

The Vice-Chancellor of Cambridge University gives notice that the election of a Francis Mond Professor of Aeronautical Engineering will take place at 3 p.m. on Friday, Sept. 26th, at the University Offices, St. Andrews Street.

Candidates for the vacant professorship are requested to communicate with the Vice-Chancellor, and to send such evidence as they may desire to submit to the electors, on or before Friday, Sept. 19th.

The Lord Advocate and Sir John Hunter.

There is a very pretty argument in progress between Mr. Clyde, Lord Advocate of Scotland, and Sir John Hunter, lately Chief of the Air Ministry's Works and Buildings Department. Sir John apparently thinks that certain people should be prosecuted for various alleged crimes, while the Lord Advocate says that a prosecution would fail for lack of evidence. On such a question it seems wiser to back the Lord Advocate, who may be presumed to know something about his job. One is inclined to wonder whether Sir John is quite infallible at his own work. There are some quaint stories about concerning his ideas as to the works and buildings necessary for the handling of seaplanes into and out of the water at seaplane stations, and if those stories are true the country is a good deal richer because the proposed works were never put in hand.

The Schneider Cup Race.

The following are the entries for the Jacques Schneider International Race to be held on Wednesday, September 10th:—

The Sopwith Aviation Co., Ltd. Sopwith biplane with 450 h.p. Jupiter Cosmos engine. Pilot, Mr. H. G. Hawker, O.B.E., A.F.C.

A. V. Roe & Co., Ltd. Single-seater float machine with Siddeley-Deasy 240 h.p. Puma engine. Pilot, Capt. H. A. Hamersley, M.C.

Supermarine Aviation Co., Ltd. Single-seater pusher-type flying-boat with 450 h.p. Napier Lion engine. Pilot, Squadron Commander B. D. Hobbs, D.S.O., D.S.C.

Fairey Aviation Co., Ltd. Fairey seaplane with 450 h.p. Napier Lion engine. Pilot, Lieut.-Colonel Vincent Nicholl, D.S.O., D.S.C.

The Royal Aero Club had at the time this issue went to press received no particulars of the three French entries. The Italian entry is a Savoia by the Societa Anonima Costruzioni Aeronautiche.

The Afghan Scandal.

It is alleged that the aeroplanes used in the brief Afghan War just concluded were "all more or less obsolete, having been sent out three years before." Yet the "Times," which makes this charge, is the paper which started the crusade to cut down the Air Force Vote to a sum on which it would be impossible to support an Air Force. Consistency is sometimes advisable, even in journalism.

What is Economy?

The Harmsworth Press is busy inveighing against those women war-workers who were its pet heroines during the war. The W.R.A.Fs. come in for more than their share of abuse as a Government extravagance. Somebody must cook and wash-up for the R.A.F. Which are cheaper at the work, women who know their job, or able-bodied men who don't, and who might be better employed doing a man's work?

A Useful Purpose Again.

On August 12th the last of the host of Air Ministry officials and clerks, beauteous or merely male, who have so enjoyed the late splendid war, evacuated their dug-outs at the Hotel Cecil, and have dug themselves in at Empire House, Kingsway. With unconscious humour someone remarked that the Hotel will now be put to a useful purpose again.

That German Aviette.

A story has been going round the Press, accompanied by a photograph, stating that a "motorless aeroplane" has been raised by man-power at the Templehofer Field, Berlin, to "a height of 50 metres." The machine shown in the picture is apparently the fuselage and undercarriage of the earliest type Fokker monoplane, fitted with gull-shaped wings of at least 25 feet span. The Germans claimed at one time to be supermen. One of them must certainly be a superman if this machine ever left the ground.

Anyhow, the machine cannot be "the first real flying machine," as the "Daily News" alleges, for Messrs. Weiss and Keith, as well as Mr. Kemp and Mr. Gnosspelins have already achieved some success with "flappers."

The WORLD of AERONAUTICS (continued)

A Photographic Officers' Dinner.

The first annual dinner of photographic officers of the R.A.F. was held on the night of August 11th at the Café Royal, Regent Street. Major F. C. V. Laws presided, and Lieut.-Colonel Moore-Brabazon, M.P., was present.

The Sale of Aerial Cameras.

The Disposal Board of the Ministry of Munitions announces that, from time to time, apparatus suitable for aerial photography will be available for sale.

Attention is also drawn to a quantity of cameras, plates, tripods, and other accessories, suitable for ground work, kinema cameras, together with a small quantity of films. The stock is in London, and information can be obtained at Caxton House, Westminster.

An Inquiry.

The inquiry into the relations of the British Cellulose and Chemical Manufacturing Co. and Government Departments has now been published, and it will cause general satisfaction to the Aircraft Industry to know that this sound firm has come out with flying colours. The Committee has expressed the opinion that "nothing amounting to favouritism of the company has been shown by the Aircraft Department." One now wonders if the investigation was prompted by people jealous of this enterprising firm's success.

The Case of Miss Douglas-Pennant.

The Select Committee appointed by the House of Lords to inquire into the dismissal of Miss Violet Douglas-Pennant from the Women's Royal Air Force met on Aug. 15th to consider their procedure. The Committee sat in private.

The chairman, Lord Wrenbury, afterwards said that the procedure the Committee had adopted was that Miss Violet Douglas-Pennant has been invited to lodge not later than four o'clock on Wednesday, Sept. 3rd, with the secretary of the Committee (the Hon. E. A. Stonor) at the House of Lords, a statement of her case. This statement is to be confined to the facts which she deems relevant, and is not to include the evidence by which she will seek to support her case.

Arrangements will be made by which any person who, in the opinion of the Committee, is interested, and who wishes to take part in the inquiry, may obtain a copy of this statement. Applications for a copy should be made not later than Wednesday, Sept. 3rd, to the secretary of the Committee, supported by a statement of facts sufficient to show that the person applying is a person entitled to receive a copy.

Any such person, who wishes to advance further facts, may (not later than four o'clock on Tuesday, Sept. 23rd) lodge with the secretary of the Committee as above a statement of such further facts (without the evidence as before). A copy of every such statement of further facts to be supplied to Miss Douglas-Pennant at her request not later than Tuesday, Sept. 30th.

The Committee will hear evidence upon the facts alleged in the several statements, or such of them as they deem relevant, and will not allow the parties (without special leave given by the Committee) to travel beyond those statements or so much of those statements as the Committee determine to be relevant. But the Committee reserve the right to hear any other party they think proper, and to extend their inquiry to any further matters which they deem to fall within the limits of their reference.

The inquiry will be held in public, the Committee reserving power to sit in private at any time they think proper. The parties will be heard by counsel if they so desire.

Sources of Information.

The following letter appeared in the "Morning Post" of August 15th:—

Sir,—Having regard to the publicity that has been given to this matter in the House of Commons and elsewhere, should not the fact that, as a public accountant, I found it necessary to resign my appointment as Honorary Chief Auditor of Works Accounts, Air Ministry, in December last, be brought to notice?

I was first associated with the Air Ministry, December, 1917, to March, 1918, as Chairman, Board of Financial Control, and subsequently as Adviser to the Finance Department

On being invited to rejoin the Ministry in May, 1918, I accepted the honorary position of Chief Auditor of Works Accounts, fully aware of the state of affairs in connection with aerodrome construction accounts, and only resigned when it became impossible to contend against the thinly disguised obstruction encountered. The experience I had of lack of administrative ability, and ignorance of the most elementary form of accounting on the part of responsible heads of departments was probably unique.

I placed the whole facts in connection with the matter before the Exchequer and Audit Department, and also the Treasury in February last, owing to the refusal of the Air Ministry to do so. Presumably the result of this action was the appointment by the Treasury of the Committee, under the chairmanship of Sir Maurice Fitzmaurice, referred to by Mr. Winston Churchill in the House of Commons on Tuesday last.

Surely there should be a proper inquiry in public to ascertain the facts, and to find out who has created the "Smoke Screen," quoting the Lord Advocate of Scotland, that has allowed an auditor to resign without comment or reference to the "Shareholders."—Yours, etc.,

ARTHUR C. ROBERTS.

9 and 10, Pancras Lane, Queen Street, August 14th.

[One is glad to see Sir Arthur Roberts thus assisting in clearing up the financial scandals of the Air Ministry, and one hopes that when Parliament assembles after the Recess he and his colleague, Mr. Bertram Jones, will take the matter further. Mr. Bertram Jones was also concerned with the Supply Department, and should be able to bring forward much information of high value to any Committee of Enquiry.—ED.]

A Souvenir of a Fine Flight.

On Saturday, Aug. 16th, H.M. the Queen of Spain accepted a gold cup as a souvenir of the arrival of the first commercial aeroplane to make a non-stop flight from London to Madrid on an Alliance aeroplane with a 450 h.p. Napier "Lion" engine. The cup was presented by the pilot, Capt. W. R. Curtis, R.F.A., and Mr. J. A. Peto. At the same time Her Majesty was handed a letter from her mother, Princess Beatrice.

Information Wanted.

Is it a fact that the Admiralty has recently placed orders on its own account for seaplanes "for experimental purposes" with one or two aeroplane constructors in this country? The rumour is very persistent, and if based on fact the act seems wholly commendable. The only thing that makes one doubt it is that it seems far too sensible a thing for the Admiralty to do.

The "Daily Express" Prize.

The "Daily Express" has received a cablegram from the Mayor of Johannesburg congratulating that paper upon its offer of the prize of £10,000 for reliability flights, South Africa and India.

The Royal Aero Club.

COMMITTEE MEETINGS.

A meeting of the House Committee was held on Aug. 12th.

A meeting of the Committee was held on Aug. 13th.

The following new members were elected:—Capt. John Alan Bott, M.C.; Major William Grahame Chambers, R.A.F.; Donald Robert William Gedge; Lady Sybil Grant, Lieut. Edgar Wikner Percival, R.A.F.; Lieut. Reginald James Read, R.A.F.; Major Henry Joseph Cecil Smith, R.A.F.; Capt. Francis Edward Fitzroy Smyth, R.A.F.; Lieut. Kenneth George Withers, R.A.F.

On the recommendation of the Flying Services Fund Committee, Col. C. R. Samson, D.S.O., was appointed to fill the vacancy on the Flying Services Fund Committee caused by the resignation of Col R. H. More.

THE BRITISH RECORD FOR SPEED IN A CLOSED CIRCUIT.

The following British record for speed in a closed circuit was granted:—

SPEED IN A CLOSED CIRCUIT.

Date.	Pilot.	Machine.	Motor	M.P.H.
June 21st, 1919.	Capt. G. H. Gathergood.	Airco 4.	Napier "Lion," 450 h.p.	129.3

THE JACQUES SCHNEIDER INTERNATIONAL RACE.

The following entries have been received:—

Great Britain.—Sopwith Aviation Co., Ltd., Kingston; Supermarine Aviation Co., Ltd., Southampton; A. V. Roe and Co., Ltd., Manchester; Fairey Aviation Co., Ltd., Hayes.

France.—Three entries (particulars not yet available).

Italy.—"Savoia."

The race will take place on Wednesday, Sept. 10th. The course is 200 nautical miles, exclusively at sea, in a circuit of about 20 nautical miles, embracing Bournemouth, Swanage and Christchurch.

Messrs. S. E. Saunders, Ltd., of Cowes, have kindly placed their sheds and slipway at the disposal of the Club for the competing machines.

THE AUSTRALIAN GOVERNMENT £10,000 PRIZE FOR A FLIGHT FROM GREAT BRITAIN TO AUSTRALIA.

The following entries have been received:—Lieut. Bert Hinkler, Lieut. C. Kingsford Smith and Lieut V. Hendle, Mr. Harry Alexander Rigby, Alliance Aeroplane Co., Ltd., Martinsyde, Ltd.

The attention of the competitors is drawn to the following supplementary regulations:—

1. No start will be permitted until subsequent to September 8th, 1919.
2. Machines must have a flying range of at least 500 miles
3. A competent navigator must be carried, who may be the pilot
4. Competitors must satisfy the Royal Aero Club that landing places are available.
5. At the request of the Australian Government it has been decided that the motor or motors may be changed en route.

AIR NAVIGATION REGULATIONS AND FREE BALLOONING.

The Royal Aero Club has received a letter from the Air Ministry stating that the revision of the Air Navigation Regulations as affecting Free Ballooning is under consideration

In the meantime, the Air Council will, on the application of the Club, consider any special exemption required.

COMING EVENTS.

AUGUST.

Amsterdam Aircraft Exhibition. (Still open.)

Thursday, August 21st.—R.A.F. Annual Athletic Meeting at Stamford Bridge.

Sunday, August 24th to Sunday, August 31st.—The "Avenir's" Tour de France Aérien is due to start.

SEPTEMBER.

Monday, September 1st.—Last day for presentation of British machines for the Schneider Cup Competition.

Wednesday, September 10th.—Schneider Cup Competition, Bournemouth.

DATES TO BE ANNOUNCED LATER.

Hendon-Paris-Hendon Air Race.

The "Daily Express" £10,000 Prize Competitions.

Hendon-Manchester-Hendon Air Race.

AIRCRAFT IN PARLIAMENT

HOUSE OF LORDS.

On August 14th, on the motion of Earl STANHOPE, the following were appointed a Select Committee to deal with the inquiry concerning Miss Violet Douglas-Pennant:—The Earl of Denbigh, the Earl of Kintore, Lord Methuen, and Lord Wrenbury. The noble Earl intimated that he had given notice that on the following day he should move the addition of Lord Glentanar to the Committee.

* * *

HOUSE OF COMMONS.

The following oral answers were given on Aug. 11th:—

FORCES OF INDIA (AEROPLANES).

Major-General SEELY, replying to Captain R. Terrell, said: Owing to transport difficulties there has been delay in supplying the forces of India with the required number of machines of suitable types. There has been adverse criticism on the types employed. We did not get the right type of machine for the purpose, but that is being remedied.

Major-General SEELY, replying to Mr. Billing, said: The officers responsible for selecting the types used were aware that machines which will fly in this country will not fly in India

* * *

The following written answer was given on Aug. 11th:—

WOMEN'S ROYAL AIR FORCE.

Major-General SEELY, replying to Lieut.-Commander Kenworthy, said: The numerical strength of the Women's Royal Air Force at the dates mentioned by my hon. and gallant friend was as follows:—

	Officers.	Other Ranks.
Jan. 1st, 1919	545	24,911
July 1st, 1919	434	18,282
Aug. 1st, 1919	407	15,700

The force is being demobilised as quickly as circumstances will permit with the object of reducing the numbers to about 3,200, at which figure it is intended the post-war strength of the force shall be fixed.

* * *

The following oral answer was given on Aug. 12th:—

ANTI-AIRCRAFT SERVICE (GENERAL SERVICE MEDAL).

Mr. J JONES asked the Secretary of State for War if he will reconsider the question of granting the general service medal to the members of the anti-aircraft service.

Captain GUEST: As I have already stated, the question of an award to those who served at home during the war is under consideration.

Mr. J JONES: Is the hon. and gallant gentleman aware that large numbers of these men were actually in danger; while some men who have the medal were never near the firing-line and were never in any danger?

Captain GUEST: There is a certain amount of truth in what the hon. Member says. The men composing the committees considering the question have been in the operations and on home service during the war. The War Office has been largely guided by their advice.

* * *

The following written answers were given on Aug. 13th:—

CONTRACTS (SELECT COMMITTEE'S REPORT).

Mr. DAWES asked the Under Secretary of State to the Air Ministry whether he was aware that the Select Committee on National Expenditure have recently reported in connection with certain clothing contracts that (1) the replies given to them by Major Cockburn, R.A.F., were contradictory and unsatisfactory; that (2) they were unable to attach any credence to the statements made to them by Colonel Latimer, R.A.F.; and that (3) the replies given to them by Colonel Bersey, R.A.F., were very unsatisfactory, and that (4) this officer ignored the request of the Committee to come before them for further examination. (5) What are these officers' war records? Are they still on the active list? and (6) what action, if any, will be taken with the matter?

Major-General SEELY said that the answer to the first two questions was in the affirmative, and to the third the complaint was that Colonel Bersey did not attend at all and not that his replies were "very unsatisfactory."

As regards (4) a letter was sent from Colonel Bersey's solicitors explaining his non-appearance. The Air Ministry is not aware of anything in his conduct to show that he wishes to avoid examination. At present he is attending in London to give evidence before the O'Sullivan Court of Inquiry.

As regards (6) he could not make any statement until the findings of the above-mentioned Court of Inquiry were received.

In answer to (5):—

Major Cockburn was transferred from the Army to the Royal Air Force as from April 1st, 1918, and was employed at Headquarters up to Oct. 24th, 1918, first with the Directorate of Manning and then in the Directorate of Air Quartermaster Services. He was then transferred to Headquarters Midland Area, where he remained until he was demobilised on Feb. 21st, 1919.

Colonel Latimer was employed in an administrative position first at South Farnborough, and then at the Air Ministry, from Oct. 12th, 1916, until May 3rd, 1919, when he relinquished his commission.

Colonel Bersey joined the Service on Oct. 29th, 1917, and was employed in an administrative capacity under the Air Board and Air Ministry until Sept. 30th, 1918, when he was transferred to No. 7 Royal Air Force Reception Depot, where he remained until his transfer to the unemployment list on April 25th, 1919.

* * *

The following references to the Royal Air Force are abstracted from the debate on the third reading of the Consolidated Fund (No. 2) Bill in the House of Commons on August 12th:—

Major-Gen. SEELY made a statement which he had promised the House with regard to the expenditure of the Air Ministry and certain specific complaints.

Major-Gen. SEELY said that the point was constantly raised outside the House that we were extravagant in that we put up Estimates of £66,000,000 for the Royal Air Force. The great proportion of that amount was for the finishing of war contracts (we had arrangements to produce 50,000 aeroplanes per year), and it had no relation whatever to the ordinary Estimates for the Air Ministry.

At the time of the Armistice we had 30,000 officers, and 20,000 of these had been demobilised. We had then 264,000 cadets and other ranks, of which 203,000 had been demobilised; 210 aerodromes and landing-grounds had been given up out of 386.

The number of staff of the Ministry at the date of the Armistice was 806, it had now been reduced to 402. We had 2,145 hired premises and hotels; 1,927 had been given up, and 37 more were in process of being given up.

The number in the Women's Royal Air Force had been reduced by not quite half. They were going to be reduced to about 3,000 and would do all the work of domestic service, for which women were more suitable than men.

General charges of extravagance against the Air Ministry were constantly made. He asked that specific cases should be shown. Three such cases had been ventilated in the House and in the Press.

The first was the statement in a letter to the "Times" that aeroplanes were being recklessly destroyed and that most horrible waste was going on at Farnborough. He went down there and had never seen a business so well organised.

Major-Gen. SEELY said: "The officer in charge was a man who had made a speciality of salvage work, and had earned the thanks of his superior officers in France, owing to his great skill and the saving of millions of money to the public by his salvage."

Every part of an aeroplane that could be sold was collected and sold by auction or otherwise. The officer assured him that the business did just pay.

Major-Gen. SEELY said: "I am not sure that it will be found, when full accounts are made up, that it does not pay to go through this elaborate business, but at least we have saved tens of thousands, probably hundred of thousands of pounds, by the meticulous care shown by these people at Farnborough in the difficult art of breaking up an aeroplane and salving the parts."

The next case was the Air Ministry cars. There had been sixty-eight; now they had been reduced to twenty-two. There were thirty-three allotted cars for officers going to particular places. These had now been reduced to six. Sir F Banbury's Committee had investigated the question of the cost of these cars. A mistake had been made and it was assumed that the touring cars cost £2,700 a year to run, whereas that amount covered the total cost of 238 vehicles. He had been working out the cost of running a motor-car and believed it worked out at £593.

The next specific allegation related to Blandford. This case had been made much of by the Press and especially by the "Times." A letter which the "Times" made much of stated that the camp should not be there at all, that a railway should not have been built to it, that it costs 4s. 7d. a day to get the girls to work and that there appears to be as many lorries as there were when the camp was full.

Blandford had proved to be one of the healthiest places in England. The railway must have paid for itself over and over again in taking the amount of equipment and stores necessary for this huge depot which had to equip and send out 800 men a day.

The whole of the pay, pensions, gratuities and records of the men of the R.A.F. were done at the depot. The girls had to be kept to do the work. There was no room in the camp for them. It would have cost much more to move the depot. The cost of getting the girls to work was £4 5s. 3d. for three months, which worked out at 11.3d. and not 4s. 7½d. There were 133 lorries in use; there are now 33.

They were building up the new Air Force at the same time as they were reducing the old. In desiring to carry out his duty he had reduced too fast. He did not leave his office as a rule before eight. General Trenchard, General Sykes, and their officers were always there still. These men had been working for the last few months from ten to fourteen hours a day. They were gravely overworked.

Major-Gen. SEELY said: "I saw General Trenchard this morning and he said to me, 'I wish you would tell those to whom you speak that I long to hear any cases of extravagance.'"

It was sometimes definitely asked in the Press, "What is the good of the Royal Air Force? Is it worth while keeping it? Millions of money is unnecessarily spent on it." Already this year the R.A.F. had saved millions of money and thousands of precious lives. The Afghanistan rebellion of 1879 was fought with extraordinary skill by Lord Roberts, but it cost £14,000,000 and thousands of lives. This year a similar rebellion occurred, and two men knowing India well, Sir William Birdwood and General Sir O'Moore Creagh, the Commander-in Chief in India, both said that aeroplanes shortened the war very considerably.

During the rebellion in Egypt all communications were cut for several days and all had to be carried by air. In 1882 Lord Wolseley crushed a similar rebellion in a couple of months, but it cost £1,800,000. The largest estimate of the cost of the work done by the Air Force in Afghanistan and Egypt worked out at £43,000 each. To this had to be added the cost of the other troops, but it has been said that bombing stopped the Afghan War and aeroplanes the Egyptian rebellion. It can be said that the Air Force has saved tens of millions of pounds.

The LORD ADVOCATE (Mr Clyde) said that the Renfrew aerodrome was contracted for by the War Office near the end of 1917. It was taken over by the Air Ministry and reconstituted on Feb. 8th, 1918. At the end of 1918 the Air Ministry became aware that the affairs of the contractor were in a state of extreme mismanagement. Some £50,000 or £60,000 had been spent for which there was no work to show. This sum of money was not to be the subject of contemplated criminal proceedings.

The only information lodged with his Department (the Criminal Department of Scotland) was in reference to proceedings for £286 4s. 5d. made up of paltry sums of £89 5s. 2d. and £196 19s. 3d.

In the middle of Feb. 1919, when the investigations were complete, it was obvious that any idea of prosecution for the first of these two sums must be abandoned

Mr. CLYDE said: "The reason was that it was not possible to obtain evidence by which you could define particular entries in the accounts as being ungenuine, false or inaccurate." With regard to the second sum he had the inquiries exhausted as the evidence was exceedingly thin and the difficulties in regard to identification were very great.

The bookkeeping was in a state of confusion and could not be checked in an ordinary way.

Where work has to be done under dirty and disagreeable conditions, what is called dirty money is often paid to the men. In this case dirty money was paid for the dirty work done. It was entered in the wages sheet on the week succeeding the week in which the payments were actually made. Care was not taken to enter the amounts of the dirty money opposite the names of the men who received it. A very large number of men were employed on this work. That dirty money system was a very bad practice, but he came to the conclusion that there was nothing left of the criminal charge and wrote a letter to that effect to the Air Ministry on March 6th.

Sir JOHN HUNTER was grievously disappointed. Mr. Clyde had an interview with him in which Mr. Clyde told him that even if the prosecution for the £286 ended in success, which it would not, it would carry no distance at all to the recovery of the £50,000 or £60,000 which Sir J. Hunter thought to be lost. Mr. Clyde advised him to raise civil proceedings for the recovery of the £60,000.

Mr. CHURCHILL said that Sir D. Maclean had referred to the clothing contract case which is associated with the activities of Miss Douglas-Pennant. He had been trying to induce her to state a case for inquiry on any charge of corruption or immorality without success. But charges had been made by a Miss O'Sullivan in regard to a particular contract, and an inquiry was ordered on the moment that those charges were made. That inquiry is taking place now, and will be made public.

In regard to the Renfrew aerodrome, one of the allegations was that a military officer who was involved in the proceedings was not tried by court martial on the demand of Sir John Hunter. The officer was a Canadian lieutenant employed under the Air Ministry in Sir John Hunter's department.

Mr. CHURCHILL said: "Sir John Hunter wrote to the Adjutant-General to demand that the officer should be placed under arrest, but the reason he gave was this: 'I am unable to formulate any definite charge against him under civil or criminal proceedings, but I demand that he shall be placed under arrest.' The Adjutant-General, not unnaturally, refused to take such a step against a Canadian officer, who is to a very large extent, except in case of emergency, outside the War Office jurisdiction, unless there is the prosaic formality of a definite charge in the first instance."

This officer was detained by the Canadian authorities at their request for upwards of three months, until the Crown Council in Scotland and the Lord Advocate's Office definitely reported that no charge against him could be made the subject of a criminal investigation

When Mr. Churchill became responsible for the Air Ministry in January he had many misgivings about the state of the aerodrome works finance and contracts of the Air Ministry. At the end of February Sir James Stevenson drew his attention to the state of the finances and accounting. He was advised to appoint Messrs. Price, Waterhouse, and Company, one of the best firms of chartered accountants in the country, to make a special expert investigation into the whole of this subject.

He expected that the staple topic of the Report of the Committee of National Expenditure would have been on this investigation, which had been in operation for four or five months. Instead a very large proportion of the Report was occupied by the somewhat sensational evidence given by Sir John Hunter, which, as the Lord Advocate has shown, related not to £60,000 as was apparent from the Report, but only to very much smaller sums.

Mr. CHURCHILL next spoke on the subjects of Army and Air Force finance.

He said that it has been arranged with France that by Oct. 31st our forces on the Rhine will be reduced to the dimensions of a strong brigade, four or five thousand men. The Air Force will be reduced to the dimensions of a single squadron. The expenditure this year depends upon what is happening, but that of 1920-21 should depend on policy, and that is still in the hands of Parliament and the Cabinet. They can decide on the size of the Army and the Royal Air Force, or how much they will spend on each.

We had practically no Air Force before the war, and at the end of the war we had the finest Air Force in the world The demobilisation of the Air Force has gone faster than that of the Army. Since the Armistice the Army has been reduced to about a quarter and the Air Force to about a fifth.

With regard to the permanent structure of the Air Force, he said he had instructed Sir Hugh Trenchard that he must provisionally frame his scheme within £25,000,000 a year, which is equal to something less than £12,000,000 a year at a pre-war basis. An earnest and resolute effort must be made to reduce the costs of the national Government. "I believe that it will be found, in these four or five years after the war, that the best course for the armed forces of the Crown is to aim at scientific progress and quality rather than mere numbers or instant readiness for action."

Mr. WALLACE said that when the Air Ministry demanded over £60,000,000 for a year of peace for the Air Service the Chancellor of the Exchequer should have had it reduced by at least 50 per cent. or resigned his office. He continued:—

"I read wonderful accounts in the newspapers of what the Air Ministry is doing. I saw the account the other day of a wonderful new airship which the Air Ministry had ordered. It took 200 men to bring this airship safely to land. A statement of that sort leaves me very cold. I am not uninterested in the development of aviation. It would interest me more, however, very much more, if I saw 200 men in this House banded together determined to bring to earth Government Departments who at the present time are floating, complacently and buoyantly, in an atmosphere of extravagance!"

He hoped that the Prime Minister would take this matter of retrenchment in hand. Commercial firms should develop commercial flying, and the Government should let it alone.

Mr. RAPER: "So far as the Air Force is concerned, I will simply say that I hope the Government will see their way to allow ex-Air Force officers and mechanics to volunteer for service with General Judevitch, and that the Government will see their way to grant these officers and men the necessary facilities and permission and to supply General Judevitch with the necessary machines and equipment. I suggest this as one means of assisting Finland and of strengthening her position as the bulwark of Western Europe against the poisonous flowing flood of Bolshevism."

* * *

The following oral answers were given on Aug. 14th:—

ROYAL AIR FORCE (ESTABLISHMENT).

Major-Gen. SEELY (Under Secretary of State for Air) replying to Mr. BETTERTON said that the saving which could be effected in expenditure by a revision of the R.A.F. establishment was under consideration and a provisional establishment has been drawn up which shows very substantial reductions. The results will be embodied in the Air Estimates.

SUFFOLK AERODROMES (RELEASE OF LABOURERS).

Major-Gen. SEELY replying to Lieut.-Col. GUINNESS said that the number of men employed on the removal of surplus material at Aldeburgh and Orfordness has now been reduced to six and thirty-three, respectively. Any bona fide agricultural labourers amongst them are to be immediately released for work on the land. In addition forty men, including some local labour, have been employed by the Air Ministry on the very urgent work of repairing sluices and sea-walls, which should be finished in about a month from now. He was not aware that Sir J. Hunter had these places in mind when he referred to the 70,000 men whom he described as not having earned their money.

Major-Gen. SEELY replying to Lieut.-Commdr. KENWORTHY said that the two aerodromes were started long before the war and not to meet the submarine menace.

COMMERCIAL AIRCRAFT (COMPETITIVE DESIGNS).

Lieut.-Col MALONE asked the Under Secretary of State to the Air Ministry whether it was proposed to hold a competition for commercial types of aircraft; and, if so, when particulars would be published.

Major-Gen. SEELY: Yes, Sir. During the war the paramount necessity in aircraft design was military efficiency, but for the successful development of aviation the first essential is safety. The Government have accordingly decided to institute a competition with a view to obtaining a type giving greater safety. Any machine which succeeds in qualifying will represent a great advance in respect of safety and comfort over any machine at present in use.

The Treasury have agreed to the competition, and I am sure that, even at this juncture, the House will not grudge the funds for the prizes. Prizes will be offered for three types of aircraft—a smaller aeroplane, a larger aeroplane, and a seaplane, respectively. In addition to the advantage to civil aviation the lessons learnt will be of the greatest value to the Royal Air Force.

The precise terms of the competition will be announced in a few days. If all the competitions are won, the amount required for prizes would be about £4,000.

The following written answer was given on Aug. 14th:—

BRITISH ARMY AND AIR FORCE (STATISTICS).

Mr. FORSTER replying to Major FARQUARSON said that the number of men who have served in the Army and Royal Air Force from the beginning of the war till Nov., 1918, was 5,756,252; the number discharged or demobilised to the end of July, 1919, was 3,719,950, and the number discharged invalided to the end of July, 1919, was 722,903. These figures do not include the R.N.A.S.

CONTRACTS (SELECT COMMITTEE'S REPORT).

In the last issue of THE AEROPLANE oral answers on the above subject were taken from the "Times." The date on which they were given was stated by error as Aug 4th. They were given on Aug. 11th.

The Power Plant and Car of an American C Class Naval Airship.

NAVAL & MILITARY AERONAUTICS

GREAT BRITAIN.

FROM THE COURT CIRCULAR.

BUCKINGHAM PALACE, August 12th.

Lieut. W. A. Coryton (R.A.F.) had the honour of being received by The King.

OFFICIAL COMMUNIQUÉS.

The following communiqué was issued at Simla on August 11th:—

We bombed the Wazir camp at Miranshah on the 9th, inflicting some casualties.

An aeroplane reconnaissance on the 10th reports no enemy between Murgha and Fort Sandeman.

* * *

On August 13th, British aeroplanes again bombed the fortress of Kronstadt. Hits were observed.

* * *

The Finnish General Staff states that two British aeroplanes crashed at Koivisto. The casualties resulting therefrom are unknown.

* * *

It has been reported by the newspaper "Helsingen Sanomat" from the usual unreliable source that the town of Olonetz has been bombed by the British aeroplanes. The source of this information, a fugitive from Petrosavodsk, said that leaflets stating that the British were arriving at the last-named town on August 20th were also dropped.

AIR FORCE.

FROM THE "LONDON GAZETTE."

AIR MINISTRY, August 8th.

DENTAL BRANCH.—G. Packman is granted a temp. commn. as Capt., Aug. 1st.

The following temp. appointments are made:—Staff Officer, 2nd Class.—(Air) Capt. A. D. Spiers, Nov. 11th, 1918, and to be actg. Maj. while so empld. till April 30th.

Staff Officers, 3rd Class.—(Air) Capt. V. Buxton, from (S.O.)2, Aug. 2nd; Sec. Lt. A. Jukes, July 13th, and to be actg. Capt. while so empld.

FLYING BRANCH.—Capt. A. W. Bird, D.S.O., to be graded for purposes of pay and allowances as Maj. while empld. as Maj. (A.), May 1st.

Lt. R. G. Rolfe-Rogers to be graded for purposes of pay and allowances as Capt. while empld. as Capt. (A.), May 1st

Lt. H. C. Leaver to be Lt. (A.), from (O.), June 3rd, 1918.

Sec. Lt. C. L. C. Craft (late Gen. List, R.F.C., on prob.) is confirmed in his rank as Sec. Lt. (A.), Nov. 2nd, 1918.

J. E. Tarlton (Sec. Lt., R.G.A.) is granted a temp. commn. as Sec. Lt. (A.), July 7th, 1918.

T. A. Woodward (Sec. Lt., L'pool R.) is granted a temp. commn. as Sec. Lt. (O.), Nov. 16th, 1918.

The following relinquish their commns. on ceasing to be empld.:—Sec. Lt. F. W. F. Turner, Sept. 14th, 1918; Lt. J. G. MacKenzie (Lt., Cent. Ont. R.), March 31st; Lt. H. Cassels (Capt., Can. Highrs), April 14th; Lt. R. Grandy (Lt. (actg. Capt.), R. Newfoundland R.), June 22nd; Lt. (Hon. Maj.) J. L. Booth (Maj., R.E., T.F.), June 30th; Sec. Lt. A. W. Wyncoll (Lt., R. Lancs. R.), July 29th; Sec. Lt. (Hon. Lt.) J. F. D. Tanqueray (Lt., Can. Engrs.), Aug. 6th.

Transferred to unempld. list:—Sec. Lt. G. W. Fitchie, Jan. 24th; Sec. Lt. G. Crosthwaite, Jan. 30th; Lt. N. J. Taylor, Feb. 14th; Lt. J. E. Doe, Feb. 18th; Sec. Lt. L. K. Davidson, Sec. Lt. W. Snaw, March 1st; Sec. Lt. (Hon. Lt.) R. H. Stonmill, M.M., March 14th; Capt. H. J. Wiser, April 1st; Lt. G. S. Frame, April 10th; Lt. S. Humphries, April 11th; Capt. L. H. F. Irving, April 16th; Lt. J. H. Forbes, April 18th; Lt. S. G. Pearson, April 19th; Sec. Lt. W. B. Smith, Lt. P. B. Williams, M.C., April 20th; Lt. J. H. Forman, Sec. Lt. F. W. Wells, April 22nd; Lt. D. Cairns, April 23rd; Sec. Lt. W. N. Simpson, April 24th; Sec. Lt. A. E. Thorp, May 3rd; Maj. J. W. Jardine, May 5th; Sec. Lt. H. A. Scrivener, May 9th; Lt. E. J. Finch, May 16th (substituted for the notification in "Gazette," June 3rd); Sec. Lt. J. B. Weir, May 18th; Sec. Lt. P. H. B. Wood, May 19th (substituted for the notification in "Gazette," May 20th); Sec. Lt. W. G. Campbell, May 20th (substituted for notification in "Gazette," May 20th); Lt. G. A. Welsh, *May* 20th; Sec. Lt. J. E. Taylor, June 13th; Capt. J. S. Smith, June 14th; Sec. Lt. (Hon. Lt.) B. P. Springett, June 17th; Lt. F. P. Watson, June 18th; Lt. C. L. Willcock, June 19th; Lt. C. Thomas, June 24th; Lt. E. H. F. Scott, June 26th; Lt. A. H. Stead, June 28th; Lt. E. J. Furlong, D.F.C., Lt. E. J. Stephens, July 2nd; Lt. T. H. French, D.F.C., Lt. W. Skelton, July 4th; Sec. Lt. E. O. Humphries, July 7th; Sec. Lt. R. C. Tice, July 8th; Lt. I. W. T. Fraser, Sec. Lt. J. M. Freston, Lt. I. de W. Wood, July 10th; Sec. Lt. R. J. Tilney, July 11th; Lt. C. Becker, Sec. Lt. W. L. Dean, Sec. Lt. P. G. Rowe, Sec. Lt. W. J. Sanderson, Sec. Lt. F. J. Seaton, Sec. Lt. M. L. Selkirk, Sec. Lt. E. G. Simpson, Lt. E. S. Smith, Sec. Lt. G. L. Smith, Lt. N. L. D. Smith, Lt. E. L. Smithers, Sec. Lt. (Hon. Lt.) O. B. Thompson, Sec. Lt. S. O. Truby, Lt. C. R. Wrede, Sec. Lt. P. H. Zealand, July 12th; R. A. Stedman, July 14th; Sec. Lt. R. Franklin, July 17th; Lt. M. W. Clark, Lt. G. T. Scott (substituted for the notification in "Gazette," July 29th), July 18th; Lt. H. E. Judge, July 19th; Capt. T. C. Arnot, Sec. Lt. E. T. Shone, July 21st; Sec. Lt. W. E. J. Bloodworth, Lt. C. T. Brown, Sec. Lt. (Hon. Lt.) H. D. D. C. Tiley, July 22nd; Lt. R. H. Speight, July 23rd; Capt. C. C. Sharp, Sec. Lt. E. W. Steele, July 24th; Lt. R. Alton, Sec. Lt. (Hon. Capt.) R. Bomphrey, Sec. Lt. D. E. Dann, Sec. Lt. D. C. Hurworth, Lt. E. E. Wright, July 25th; Sec. Lt. H. G. Dixon, Lt. J. R. H. Hewlett, Lt. J. G. Kingsbury, Lt. (Hon. Capt.) W. L. Pittendrigh, July 26th; Capt. J. H. P. Brain, July 27th; Capt. M. T. Baines, Capt. C. A. Hervey, Lt. R. G. Young, July 29th; Sec. Lt. (Hon. Lt.) H. B. C. Nicholls, July 31st; Lt. E. E. Moodey, Aug. 1st; Sec. Lt. P. S. Joubert, Aug. 7th; Sec. Lt. R. E. Bell, Sec. Lt. G. P. Mitchell, Aug. 10th; Lt. C. W. Davies, Aug. 14th; Lt. R. J. Thompson, Aug. 15th (substituted for notification in "Gazette," July 29th).

The follg. Lts. relinquish their commns on account of ill-health, and are permitted to retain their rank:—H. F. N. Jones (contracted on active service), June 12th; C. Miller (contracted on active service), June 25th; W. R. Elson, E. R. Salter (contracted on active service), July 31st; J. Burdekin (contracted on active service), A. E. Garrison, M.C. (caused by wounds), E. Snell, Aug. 1st.

Sec. Lt. W. D. Wood is antedated in his appointment as Sec. Lt. (A.), May 10th, 1918 (substituted for notification in "Gazette," Aug. 12th).

The rank of Lt. D. F. Brookes is as now described, and not "Sec. Lt," as stated in "Gazette," May 5th.

The notification in "Gazette," Dec. 31st, 1918, concerning Sec. Lt. D. G. Fraser, is cancelled.

The notification in "Gazette," June 3rd, concerning Lt. G. F. Bell is cancelled.

The notification in "Gazette," July 4th, concerning Sec. Lt. C. Butcher is cancelled

The notification in "Gazette," July 11th, concerning Sec. Lt. R. J. Acheson is cancelled.

ADMINISTRATIVE BRANCH.—Sec. Lts. to be Lts.:—H. V. Hall, Nov. 2nd, 1918; R. W. Johnson, Aug. 5th

The following relinquish their commns. on ceasing to be empld.:—Sec. Lt. P. C. Cooper (Sec Lt., Northants. R.), April 20th, 1918 (substituted for notification in "Gazette," July 22nd); Lt. V. M. McMahon, M.C. (Lt., R. Dub. Fus.), Feb. 6th; Lt.-Col. E. H. Davidson, O.B.E., M.C. (Capt., Gord. Highrs.), June 12th; Lt. C. M. Sinclair (Lt., R.A.S.C.), June 24th; Lt. (Hon. Capt.) W. F. T. James (Capt., Glam. Yeo.), July 9th; Lt. J. Redmond, M.C. (Lt., R.I. Rif.), Aug. 1st; Lt. W. S. King (Lt., R. Newfoundland R.), Aug. 10th.

Transferred to unempld. list:—Sec. Lt. H. R. Cooke, Jan. 28th (substituted for notification in "Gazette," April 1st); Lt. B. C. Budd, Lt. C. P. Creighton, April 19th; Lt. S. M. Pemberton, April 20th; Sec. Lt. E. Sykes, June 2nd; Maj. (Hon. Lt.-Col.) C. P. Foley, June 3rd; Sec. Lt. V. S. Stevens, June 7th; Capt. R. G. Staveley-Dale, June 14th; Sec. Lt. W. W. Smith, July 12th; Lt. E. E. Stock, M.C., July 18th; Sec. Lt. M. T. Saunderson, July 24th; Sec. Lt. A. E. Le Sueur, July 26th; Sec. Lt. R. J. Bright, July 28th; Maj. C. Kent, July 29th; Maj. J. G. A. Baillie, July 30th; Capt. G. S. Kilby, Aug. 1st; Lt. J. Cobley (Middx. R., T.F.), Aug. 4th; Lt. W. Dee, Aug. 15th.

Capt. R. B. H. Lechmere (Dragoon Gds.) relinquishes his commn. on account of ill-health caused by wounds, Aug. 12th.

Lt. H. F. Proctor relinquishes his commn. on account of ill-health caused by wounds, and is permitted to retain his rank, July 30th.

The following Sec. Lts. relinquish their commns. on account of ill-health, and are permitted to retain their rank:—C. McI. French, July 12th (substituted for notification in "Gazette," Jan. 21st); C. Hunter, Aug. 6th

TECHNICAL BRANCH.—Capt. A. D. Spiers to be actg. Maj. while empld. as Maj., Grade (A.), May 1st

E. L. M. Emtage, July 12th, 1918 (substituted for notification in "Gazette," Jan. 3rd)

Sec. Lt. (Hon. Lt.) R. V. Weeks to be Lt., May 23rd, 1918, without pay and allowances of that rank prior to Nov. 3rd (substituted for notification in "Gazette," May 9th)

Sec. Lt. (Hon. Lt.) L. G. Martin is transferred temporarily to unempld. list, from March 27th to May 29th (substituted for notification in "Gazette," June 17th).

Transferred to unempld. list:—Sec. Lt. W. Brown, Feb. 7th; Sec. Lt. T. Conlan, Feb. 14th (substituted for notification in "Gazette," March 28th); Sec. Lt. R. E. Towler, May 5th; Capt. C. E. Turner, May 17th; Lt. S. Wilson, May 20th; Sec. Lt. W. S. C. Stephens, June 3rd; Sec. Lt. (Hon. Capt.) W. S. H. Smith, June 16th; Lt. R. H. Butler, July 2nd; Lt. J. G. Francis, July 10th; Lt. W. G. Stuart, Sec. Lt. C. W. M. Sabine, July 12th; Sec. Lt. W. G. Willis, July 16th; Sec. Lt. E. R. Veneer, July 18th; Lt. G. D. Harrison, Lt. A. Howard, July 25th; Sec. Lt. J. Bennett, Sec. Lt. (Hon. Lt.) B. L. Blomley, Sec. Lt. (Hon. Lt.) R. A. Law, July 26th; Sec. Lt. L. J. Sterlini, July 28th; Capt. O. Hardee, July 29th; Lt. W. C. England, Aug. 11th.

Lt. C. J. M. Lowe (R.E.) relinquishes his commn. on account of ill-health, Aug. 12th.

Sec. Lt. A. C. Wright relinquishes his commn. on account of ill-health, and is permitted to retain his rank, Aug. 1st.

MEDICAL BRANCH.—Maj. (actg. Lt.-Col.) B. R. Bickford, D.S.O. (Staff Surgn., R.N.), relinquishes his commn. on ceasing to be empld., Aug. 1st.

Capt. R. Hall is transferred to unempld. list, July 15th.

Capt. T. E. Mulvany relinquishes his commn. on account of ill-health contracted on active service, and is permitted to retain his rank, Aug. 13th, 1918.

MEMORANDA.—The following warrant officers are granted hon. commns. as Sec. Lts. :—L. L. Lipsky, I. V. Smyrnoff, July 30th.

Capt. M. McK. Wood, O.B.E. (Capt., Gordon Highrs.), relinquishes his commn. on being elected M.P., April 15th.

Lt. W. Lingard, M.B.E., is transferred to unempld. list, from (S.O.), July 31st.

The notification in "Gazette," July 4th, concerning Sec. Lt. C. W. Kerr is cancelled. The notification in "Gazette," July 11th to stand.

* * *

The Air Ministry announces that the following stations and landing grounds have been relinquished by the R.A.F. :—

STATIONS.—Torquay Seaplane Station; New Romney; Seaton Carew Seaplane Station; Tipnor Kite Balloon Base; Sheerness Kite Balloon Base.

LANDING GROUNDS.—Lower Beeding, Sussex; Earnley, Sussex; Kingshill (West Malling), Kent; Blackneath (Colchester), Essex; Plungar, Nottinghamshire; South Cave, Yorkshire; Bishopton, Durham; Cairncross, Berwickshire; Burnham-on-Crouch, Essex; Broomfield (Chelmsford), Essex; Appleton Wiske, Yorkshire; Ponteland, Northumberland; New Chapel, Surrey.

* * *

It is stated by Major-General Seely that there is no intention that a rigid airship shall fly to India at present.

* * *

A dinner was given at Claridge's Hotel on Aug. 14th by the Finnish Minister, M. Ossian Donner, to Squadron Leader W. G. Sitwell, D.S.C., R.A.F., and Flight Lieutenant Bailey, R.A.F. The dinner was given to celebrate the recent flight of these two officers from England to Helsingfors and back. General Swinton, of the Civil Aviation Department, was present, and Air Commodore R. M. Grove and Squadron Leader Field, R.A.F., were also there.

* * *

Private Bruckmann, 97th Infantry Reserve Regt., the German prisoner of war whose gallantry in rescuing two British officers from a burning aeroplane was recently made the subject of an Air Ministry communiqué, has left England for Germany. Before leaving England he was presented by a representative of the Royal Air Force with a sum of money and a silver watch and chain. Several thousand German prisoners were paraded at the camp to witness the ceremony.

Pte. Bruckmann was severely burned while assisting the officers.

* * *

Ballantyne, the member of the crew of H.M.A. R34, who recently created a great sensation in America and the English Press, by making the aerial voyage across the Atlantic as a stowaway, has been arraigned by his officers. He was severely reprimanded and informed that he is no longer a member of the crew of R34.

* * *

The Royal Air Force held a series of trials at Queen's Club, West Kensington, on Aug. 6th, with a view of selecting representatives for the championship meeting at Stamford Bridge on Aug. 21st.

Capt. H.R.H. the Prince Albert, K.G., R.A.F., watched the sports, and at the close presented the prizes to the successful competitors. Among others present were Brig.-Gen. T. L. Webb-Bowen, C.B., C.M.G., Col. A. M. Longmore, D.S.O., R.A.F., and Major Owen, R.A.F.

Several well-known athletes were among the competitors, and some very fair performances were recorded. Serjt. P. H. Poingdestre won both the 100 yards and quarter-mile races, the former by a good yard from Lieut. A. J. Moore, in 11 1-5 sec.; and the latter, in which he beat Serjt. R. E. Skinner by five yards, in 54 3-5 sec.

A/M. J. Pratt won the mile and three miles very easily. In both events he made his own pace throughout, and his time of 4 min. 51 3-5 sec. for the mile, and 16 min. 26 1-5 sec., were, in the circumstances, decidedly good.

Capt. Marlowe won the half-mile after a fine race with L. A/C Cook in 1 min. 57 4-5 sec., and A/M F. R. Aggersberg, the 220 yards by half a yard from Cpl. P. Wilmot in 24 1-5 sec.

Serjt. Bellingham took the long jump with 17 ft. 7 in., L. A/M Owen, the high jump at 5 ft., and L. A/M Kitson, the 120 yards hurdles. Boy Downs won the 100 yards and 220 yards races confined to enlisted boys.

The S.D. Earlscourt beat the 143rd Squadron E. two pulls to nothing in the tug-of-war, and the Sixth S.D. Ascot won the mile relay.

A relay race for the W.R.A.F., was won by N. 1 M.T. Wormwood Scrubbs, and in a tug-of-war Kidbrook beat Regent's Park with two straight pulls.

On August 8th the R.A.F. in Ireland held a sports meeting in Dublin. Among the events was an aerial race of 102½ miles. There were twenty-one competitors, the race being won in 1 hr. 9 min. 34 sec., by Lieut. Urmston, R.A.F. Captain Sibley, R.A.F., whose time was 1 hr. 9 min. 35 sec., was the second man in, but was disqualified for passing the post on the wrong side. Lieut. Baker, R.A.F., was third, his time being 1 hr. 11 min. 55 sec.

The following cricket team represented the Royal Air Force against the Army at the Oval on Aug. 15th and 16th :—

Lieut.-Col. Blount, Lieut.-Col. D. Harries, Major E. C. Baker, Capt. S. D. Harrower, Capt. W. H. G. Heath, Capt. P. Burke, Capt. G. F. Earle, Lieut. J. N. Bitton, Capt. L. P. Hoult, Lieut. F. E. S. Creek, and A.M. E. Tomkins.

The match ended in a drawn game on Aug. 16th. At the end of the first innings the score was: Army, 387; R.A.F. (nine wickets), 94. The scores for the second innings were: Army (five wickets), 60; R.A.F., 357.

* * *

Life is dull in the Air Force to those who have the ill luck to be in the North-Western Area in the land of porridge and mountain dew.

Days and weeks slip aimlessly away, and it is found harder to kill time than Huns. The dancing craze which kept messes lively during the winter months has died out, and golf and motor-cycling, or lying about the ante-room are the chief forms of passing away the idle hours.

In Montrose a stray Avro amuses the visitors about once a month, but, as few flying officers are stationed there, the sight of a machine now causes comment, and the shed doors rust on their guides.

About three dozen mechanics keep the floors swept and polish the petrol tins, and have plenty of time left for bathing.

Edgill Aerodrome is now practically non-existent, for, after the sale of buildings, etc., it has been gradually demolished, and the ground put up "to let."

Why such a site was ever chosen is one of the countless war mysteries.

Crail is being used as a storage depot for machines, and row upon rows of new unassembled Snipes and Avros fill the hangars all correctly dressed by the right.

A few of the old personnel are left to look after them, and their tired expressions gives one to see how "fed up" they are.

Leuchars has still a few flying officers and as many scout machines whose chief occupation appears to be amusing the crowds by the Tayside coast. They scare the inhabitants of the "jute and jam" city of Dundee with their low stunting, and are reckoned by those hard-headed Scots to be "fair deevils."

Their methods of advertising the Victory Loan were so thrilling that they made people run from "bonds" and banks to the Esplanade to see their exhibition. One, unfortunately, had a dip and lost his machine in the Tay, and was saved from Davy Jones' Locker by the boys of the "Mars" Training Ship near by. Thanks to the reliability of modern engines, many more of them have been saved from similar experiences.

Dundee Seaplane Base has still a large personnel, being one of the four permanent stations in Scotland, but very little flying is being done there.

Turnhouse has been allotted as one of the two aerodromes where civil machines may land, and has a small number of men looking after it, waiting for prop (and lead) swinging.

Gullane is being used as a dispersal centre for the R.A.F., and changes in personnel are so rapid that one never knows from day to day what may happen. About 20 Bristol Fighters and Avros are there and do a little flying if the weather is fine.

Its next-door neighbour, East Fortune, is another of the permanent stations, and, being the home of R.34, is quite a busy and well-known spot. Its sheds are full of craft, mostly of the N.S. type, sometimes used on instructional work.

The other aerodrome in Scotland, Renfrew, is being used as a Stores Depot for all sorts of goods from complete machines to mess teaspoons. It has a large staff of administrative and technical officers.

Last of all, our Scotch Bolo, "The Adelphi," still carries on with great form, and is still as hot on court-martials for bold, bad pilots, etc. The recurring scramble for the Staff allotment of mountain dew and the signing of chits for dances, socials, etc., keep them from being very wearied with themselves.—R. M. D.

FRANCE.

On Aug. 10th President Poincaré conferred the Legion d'Honneur upon Dunkirk. During the ceremony he stated that this town had been bombed 172 times by German aviators.

* * *

The official statistics of the losses of the Service d'Aviation Militaire have just been published, and are as follows :—

From Aug. 4th, 1914, to Nov. 11th, 1918, the losses in the

Army zones were 1,945 pilots and observers killed, 1,461 missing, whose death may be regarded as certain, and 2,922 wounded.

Outside the Army zones 1,927 pilots and observers were killed, bringing the total losses in killed and wounded up to 7,757.

As the full strength on Dec. 1st, 1918, was 12,919 men, the war losses represent 61 per cent., which is believed to be the greatest proportion of losses in any arm of any of the Allied armies. [Presumably, this means 12,919 pilots and observers, exclusive of some hundreds of thousands of mechanics and others. —Ed.]

The production of aeroplanes for the Air Service was 3,460 in 1915, 7,552 in 1916, 22,751 in 1917, and 34,219 during the first nine months of 1918. The aircraft factories employed 12,650 workers on Jan. 1st, 1915, 30,960 on the same date in 1916, 68,920 on the same date in 1917, 131,551 on the same date in 1918, and 186,003 on Nov. 2nd, 1918.

* * *

Six seaplanes under the command of Lieut. (?) de Morcourt, French Navy, will shortly fly from St. Raphael to Casablanca. Alightings will be made at the following places on the way to Casablanca :—Cette, Barcelona, Valencia, Cartagena, Malaga, and Tangier.

U.S.A.

Major Crowell, Assistant Secretary of War, has raised great controversy in the U.S. by advising the formation of a Single Air Service. The War Department agrees with Major Crowell, but the Navy, having presumably benefited by the mistakes of others, is against the amalgamation.

As a result of the reduction of the U.S. Service Estimates for the current year, it seems probable that the Army will be forced to disband its Aviation Service in the Autumn.

* * *

Lieut.-Col. R. S. Hartz is in charge of a Martin Bomber that started on an endurance flight on July 24th and will cross 31 States round the rim of the country.

Starting and finishing at Washington the total distance covered will be 7,805 miles. The flight is planned to test the endurance of the Martin Bomber and the Liberty engine, for recruiting purposes and for the charting of routes and the locating of landing fields.

* * *

It is reported that two U.S. Army aviators, Lieuts. Paul Davis and Harold Peterson, who have been missing since August 10th, have sent letters to the Military Headquarters stating that they are held to ransom by Mexicans for $15,000, and that if the money is not forthcoming by August 16th they will be executed. No official opinion has been given by the War Department.

PERSONAL NOTICES.

NAVAL.

MARRIAGE.

TRAVERS—FRASER.—On Aug. 6th, at Ryton, near Shifnal, Salop, Major H. G. Travers, R.A.F., D.S.C., was married to Hermia, younger daughter of Colonel and Mrs E. A Fraser, of Bodicote Lodge, near Banbury, Oxon, by the Rev. H. P. Fraser, M.A., uncle of the bride.

MILITARY.

ENGAGEMENTS.

CAMPBELL—COLLINGWOOD-ALLEN.—The engagement is announced of Flight Lieut. Hector A. Campbell, A.F.C., Seaforth Highlanders, attd. R.A.F., youngest son of Colonel and Mrs. Campbell, of Larachan, Sutherlandshire, to Ecie Collingwood-Allen, elder daughter of Major and Mrs. H. C. Allen, Charlton Lodge, Shepton Mallet, Somerset.

JENKINS—ROBERTSON.—A marriage has been arranged between Lieut.-Col. F. Howard Jenkins, O.B.E., M.C., R.A.F., second son of the late J. H. Jenkins, M.R.C.S., L.R.C.P., of Lytham, Lancashire, and Harriet Fernelith, second daughter of Duncan J. Robertson, O.B.E., County Clerk of Orkney.

KEMPSON—FEARNSIDE.—An engagement is announced between Capt. William Robert Kempson, R.F.A. (T.), late R.A.F., of Thorpe, Norwich, and Miss Enid Margaret Fearnside, daughter of Col. C. F. Fearnside, I.M.S., and Mrs. Fearnside, of Haven House, Conway.

WATT—MELLINGTON.—The engagement is announced between Capt. William McIver Watt, M.B.E., the Black Watch, attd. R.A.F., only son of Mr. Nat Watt, Commercial Bank House, Musselburgh, and Gwendolen Joyce, younger daughter of Mr. and Mrs. J. A. Christie, Mellington, Charlton Kings, Cheltenham.

MARRIAGES.

MATHER—WHITLOCK.—The marriage arranged between Mr. Harry Mather, late Lieut. R.F.C., eldest son of Walter Mather, Esq., Brierfield, and Chôtee, elder daughter of Lieut.-Colonel G. F. A. Whitlock, C.B.E., R.E., 30, Winn Road, Southampton, took place quietly in London on Aug. 2nd.

MELHUISH—EBDEN.—The marriage arranged between James Walter Douglas Melhuish, M.C., late 7th Worcesters and R.A.F., only son of Mr. T. W. W. Melhuish, M.I.C.E., and Mrs. Melhuish, of Clifton Hill, Exeter, and Decima Mary Tenison, only daughter of Mr. and Mrs. Tenison Mosse, of Bank of England, Manchester, and grand-daughter of the late Mon. Alfred Ebden, of Belmont, Rondebosch, Cape Town, took place very quietly on Thursday, Aug. 14th, at the Cathedral, Manchester.

SKINNER—ALLEN.—On Aug. 12th, at St. Anne's Church, Wandsworth, Lieut. Herbert Skinner, Gordon Highlanders and R.A.F., son of Reverend J. Skinner, M.A., Old Deer, Aberdeenshire, was married to Rhoda, younger daughter of Capt. Allen, O.B.E., and Mrs. Allen, Wandsworth, London, by the Reverend H. P. Statham.

AIR FORCE.

DEATHS.

GILMAN.—Lieut. Walter Gilman, R.A.F., who was previously reported missing on July 13th, 1918, after alighting in the sea when returning from a bombing raid, is now officially presumed to have died on or since that date. He was the only son of Mr. and Mrs. William Gilman, Hazelcroft, Alderley Edge, Cheshire, and was 19 years of age.

MOORE.—Lieut. James Gordon Moore, R.A.F., who died on Aug. 14th as the result of wounds received in action, was 24 years of age.

MORRIS.—A two-seater Bristol Fighter aeroplane crashed on Aug. 14th while passing over the riverside village of Hurley, near Marlow. The first arrivals found the machine a total wreck, and the aviator, Lieut. H. S. Morris, R.A.F., badly injured. He was conveyed to Maidenhead Cottage Hospital, where he died a few hours later without recovering consciousness.

ENGAGEMENTS.

CASWELL—EDWARDS.—The engagement is announced between Capt. G. F. Caswell, R.A.F., and May, daughter of George Edwards, J.P., and Mrs. Edwards, of 180, Piccadilly, W., and "Cheniston," Egham, Surrey.

ELLERTON—HUSBAND.—The marriage arranged between Capt. Alban Spenser Ellerton, O.B.E., R.A.F., and Miss Maureen Gilliland Husband, of 69, Belsize Park Gardens, will take place on Sept. 13th, at 11.30 a.m., at the Savoy Chapel. Friends will be welcome at the church.

HARRIS—CAMPION.—The marriage arranged between Capt. Stafford Berkely Harris, A.F.C., R.A.F., and Miss Enid Campion will take place at St. Jude's Church, Southsea, on Aug. 21st, at 2.15 p.m.

JUDGE—EADIE.—A marriage has been arranged, and will take place on Wednesday, September 10th, at Bromsgrove Parish Church, between Captain H. E. Judge, R.A.F., and Olivette, daughter of Mrs. Eadie, Rigby Hall, Bromsgrove, Worcestershire.

MOFFETT.—YERBURY.—A marriage has been arranged, and will shortly take place, between Ritchie Francis Henry Moffett, Lieut., R.A.F., son of J. Ritchie Moffett, of Ladybrand, O.F.S., South Africa, and Hilda Pauline, daughter of Mrs. Yerbury, 26, Milton Road, Acton, London, W.

PRYCE—HARBORD.—The engagement is announced of George, youngest son of the late Lieut.-Col. John Pryce, of Gunley, Montgomeryshire, to Phyllis, eldest daughter of Lionel Harbord, R.A.F., of Mousehold House, Norwich.

SHEPPERD—GODSON.—The engagement is announced between Lieut. Harold E. Shepperd, R.A.F., only son of Mr. and Mrs. E. A. E. Shepperd, of Knockholt, Kent, and Olive Ethel, third daughter of Mr. and Mrs. E. H. Godson, of Heckington, Lincs.

MARRIAGES.

BULMAN—FAIRMAN.—On July 16th, at Christ Church, Sunderland, Major George Purvis Bulman, O.B.E., R.A.F., only son of the late W. W. Bulman, of Alexandria, Egypt, and Mrs. Purvis Bulman, Queen's Club Gardens, was married to Emmeline Preston, youngest daughter of Mr. and Mrs. G. P. Fairman, 21, St. Bede's Terrace, Sunderland, by the Rev. C. W. Froggatt.

DE ROEPER—KEY.—On Aug. 2nd, Major Bruno P. H. de Roeper, A.F.C., R.A.F., second son of Mr. and Mrs. de Roeper, of "Bella Vista," Upminster, was married to Jean Julia Key, only daughter of Mr. and Mrs. W. Garbutt Key, of "Glen Caladh," Hall Lane, Upminster, before the Superintendent-Registrar, at Romford.

DORE—GELLION.—On July 18th, at Holy Trinity Church, Paddington, Charles Noel Gregory Dore, R.A.F., son of the late S. Lammas Dore, Esq., and of Mrs. S. Lammas Dore, of Pinner Hill, Middlesex, was married to Evelyn Emily, daughter of the late Duncan Gellion, Esq., and of Mrs. Duncan Gellion, of 2, Orsett Terrace, Hyde Park, W., by the Rev. F. A. Bealey, Vicar of St. Anselm, Hatch End, assisted by the Vicar of Holy Trinity, Paddington.

BIRTH.

WOOLNER.—On Aug. 7th, at St. Faith's Home, Mount Park Road, Ealing, the wife of Capt. J. H. Woolner, A.F.C., of a daughter.

AUGUST 27, 1919.

THE AEROPLANE

VOL. XVII. No. 9.

The Editorial and Advertising Offices of "The Aeroplane" are at 175, Piccadilly, London, W.1.
Telegraphic Address: "Aileron, London." Telephone: Gerrard, 5407.

Accounts, and all correspondence relating thereto, should be sent to the Registered Offices of The Aeroplane and General Publishing Co., Ltd., Union Bank Chambers, 61, Carey Street, London, W.C.2.

Subscription Rates, post free: Home, 3 months, 7s 6d.; 6 months, 15s.; 12 months 30s.
Foreign, 3 months, 8s. 9d.; 6 months, 17s. 6d.; 12 months, 35s. Canada, 1 Year, $8.
U.S.A., 1 Year, $8 50c.

ON THE AIR MINISTRY SCANDALS.

Doubtless some people are surprised that so little attention is being given by this paper to the Air Ministry scandals which have been occupying so unduly large a portion of the public Press and of the time of Parliament of late. Personally one can see no reason whatever for taking any interest in these scandals, except perhaps in the part in which Miss Douglas-Pennant is concerned.

When one recalls Mr. Lloyd George's connection with the Marconi scandal before the war; when one recalls the openly discussed grafts of high officials during the war; when one knows of the real financial scandals in other departments; and when one knows of the corruption, crookedness, and graft which infested the Technical, Supply, and Inspection Departments of all three Services during the war (chiefly, be it noted, owing to the introduction of numberless civilian officials by our so-called Business Government), the matters which were defended so violently by General Seely with all his usual rhetoric seem so utterly trivial that it is hardly worth while even giving up so much space to them as has been given. After all, what matters a few millions of pounds here or there when for three or four years we have been wasting at least a million a day? If the House of Commons wants an Official Inquiry into the misdeeds of officials concerned with the Flying Services during the war let it turn its attention to something more important.

What is the value of a human life in pounds sterling? It is true that the Flying Services only lost some 2,700 officers and men in all definitely known to be killed; the total casualties were 7,589 killed, wounded, and missing. And of all those killed or wrecked for life it is fairly safe to say that half have been so killed or wrecked by the misdeeds of Government officials.

Let the House of Commons go back before the war to 1912 or 1913, or at any rate to the early days of 1914, when that eminently respectable Tory, Captain Walter Faber, M.P., brought his first "Murder Charge" against the administration of the R.F.C., long before Mr. Pemberton-Billing was howled down by the hangers-on of the Government for saying that R.F.C. officers in the field were being murdered by officials at home. What is the value of the men who have since been murdered by these officials compared with the few millions about which Parliament is now in such a pother?

Subjects for Inquiry.

Let Parliament inquire why, when Colonel Seely (as he then was) stated officially that we had 120 war aeroplanes it was possible for Mr. Joynson-Hicks (as he then was) to prove that we only had 13? Let Parliament inquire why at the outbreak of war we had no British aero-engines, and why, despite the Naval and Military Engine Competition of 1914, British engine production was held back for two years, so that the Royal Aircraft Factory might experiment with engines which never become efficient, and allowed our aviators to be killed in hundreds by better-mounted enemies. Let Parliament inquire why throughout 1915 and 1916 our aircraft constructors were prevented from producing the best aeroplanes in the world while our aviators were being shot down day after day in the contraptions turned out by the Royal Aircraft Factory?

Let Parliament inquire whether and why officers who had the courage to help the Air Inquiry of 1916, which investigated these crimes, were hounded down and hustled out of the Flying Services, despite the guarantee given them that their Service careers would not suffer as the result of their patriotism?

Let Parliament inquire why the healthy competition between the R.N.A.S. and R.F.C., which enabled the R.N.A.S. to acquire the engines and aeroplanes which saved the R.F.C. when the plotters for a Government monopoly of design had failed, was killed by a still bigger monopolist plot, and why all aircraft supplies were concentrated in a single Department which failed as lamentably as did the Royal Aircraft Factory?

Some More Subjects.

There are plenty more subjects into which inquiries can be held if there is any real desire in Parliament to get at the truth and to purify the future of the Royal Air Force. It was commonly reported that certain R.A.F. stations were hot-beds of vice and were the hunting-grounds of procureurs of both sexes. Is that a subject worthy of inquiry? Perhaps Miss Douglas-Pennant will attend to this question.

It is known that drunken debauches were not merely common but customary in many R.A.F. stations. Should that pass without inquiry?

It is known that common bribery and corruption, as well as the higher and more subtle kinds of graft, prevailed throughout the war in the Technical and Supply and Inspection Departments. Is that to be investigated?

It is known that the designs of some firms were accepted without question while better designs by other firms were turned down. Is that to pass unchallenged?

It is known that thousands of pounds were handed out to some firms for experimental work while more promising designs could not obtain one pennyworth of support. Does that meet with the approval of Parliament?

The Sins of the Naval Side.

It is known that our seaplanes were shot down time after time, and that the German Brandenburg seaplanes practically held the Command of the Air over the North Sea till driven from their bases on the Belgian Coast by the British Army. Yet all the while we had in this country seaplane fighters which were far better than the Brandenburgers. Is anybody to answer for the deaths thus needlessly caused?

It is known that because of our lack of seaplanes orders were issued to escort convoys with land-going

aeroplanes which were unfit for land warfare. Who is to be held responsible for the loss of life and material caused by this policy?

It is known that in October and November, 1914, Zeppelins and their sheds were destroyed or damaged in Germany by the R.N.A.S. It was not till 1918 that any more damage was done to German airships and sheds by British aircraft. Who is to be blamed for the immunity of the Germans during the intervening years, and for the loss of life in this country caused by thus allowing the Germans to operate unmolested?

It is known that we had torpedo-dropping aeroplanes before the war and that the R.N.A.S. torpedoed Turkish ships early in 1915. Yet we had no torpedo aircraft at Jutland in 1916, nor when the "Goeben" came out of the Dardanelles in 1918. Who is responsible?

It was known early in 1917 that any sea-going ship to which a kite-balloon was attached was absolutely immune from attack by submarine. Yet the Irish mail steamer "Leinster" and Heaven knows how many other merchant ships and human lives were lost for lack of kite-balloon escort. Who is to be held responsible for these "murders"? Surely not the German submarine commanders and crews, who were merely doing their duty in enforcing an effective blockade, but rather the British Navy which, despite its much-advertised sea-power, failed so fatuously in breaking that blockade.

Camouflage.

Is the whole of this fierce agitation in Parliament merely a vast piece of camouflage designed to hide the real crimes of the Government and its hangers-on, and to side-track public attention from the main line of criminality onto these paltry financial affairs. Either those who are raising the agitation are lamentably ignorant of the graver issues or else they are peculiarly clever fellow-conspirators with the Government Departments concerned.

As for Major-General J. E. B. Seely, C.B., C.M.G., D.S.O., Under-Secretary of State for Air, he seems to be, as he was before the war, merely the dupe of the officials whose crimes he has to hide. He is quite honest and quite simple-minded, for all his cleverness. He is in fact like one of those simple yet cleverly designed jets through which the Huns used to eject poison-gas on our troops in the field, and he performs the same functions. Innocent in himself, he emits the vapour with which the enemies of his owners are doped, and, to his credit be it said, he does it quite efficiently.

But, as Mr. Joynson Hicks wrote in the "Morning Post" on March 16, 1914, "the country will not be satisfied with a mere statement by Colonel Seely." The country's estimate of General Seely to-day does not differ from its estimate of him five and a half years ago.

Certainly another Air Inquiry Committee is needed, but not an impotent affair like that of 1916. If we are to have another, let it be one with power to subpœna witnesses and to take evidence on oath, and let it be one which—on the other hand—may be forced to ask questions which are handed to it by people who are not members of the Committee. Under such circumstances it might be possible to bring some of the real criminals to justice, and to assure to the R.A.F. a clean and wholesome future.—C. G. G.

THE GOVERNMENT COMPETITIONS.

The rules issued by the Air Ministry on August 21st for the forthcoming Government trials for commercial aircraft will be found in full in this issue of The Aeroplane.

It may be said forthwith that as they stand they are totally unsatisfactory.

At the very beginning the types of aeroplane for which the prizes are to be awarded are ridiculous.

The specification for the small type, carrying pilot and passenger, calling for a maximum speed of 100 m.p.h. at least, a minimum speed not in excess of 40 m.p.h. and a climb of at least 500 feet per minute could be met by any competent designer with an engine of 60 h.p., and such a machine in the hands of a competent pilot should pass all the flying tests with ease.

There is nothing in the rules to prevent any maker from entering a machine in this class with a 600 h.p. engine and an enormous surface, commercially useless on account of its cost, but which will defeat any reasonably economically designed two-seater on landing speed, top speed, and general comfort and convenience, except that much-abused word "efficiency" included amongst the list of general features for which marks are to be awarded.

In any case the small two-seater is a machine which has no commercial use which could not be served by very slight modifications to existing machines.

Merely Ridiculous.

Had the limit for small machines been fixed at, say, four or five persons in addition to the pilot, and were there either a scale of permissible power for each passenger up to that limit, or a defined scale of awarding marks on the basis of useful weight carried per h.p., there might be some value attached to the affair. As the rules now stand, they are ridiculous. They call merely for machines designed to carry out a "stunt"—certainly a novel "stunt"—regardless of any consideration of the cost of carrying it out.

The large aeroplane class is—so far as the load to be carried is concerned—rather more reasonable. A 15-passenger carrier is a useful commercial vehicle—if it can be operated at a reasonable cost. But cost, except as regards the cost to the Air Ministry of buying the machine, is nowhere touched upon. There is no word as to cost either of manufacture, of upkeep and maintenance, or of operation, from one end to the other of the whole series of rules.

A Few Good Points.

The competition for seaplanes shows certain good points.

The condition that they must be able to land on a smooth aerodrome and to get off the same is to be commended. Even if it fails to produce any very satisfactory combined water and land undercarriages, but merely demonstrates to the general public that a decently designed seaplane can land, and even get off any reasonable aerodromes on its floats alone, it will serve a useful purpose in encouraging a more extended use of seaplanes.

The mooring-out tests should be valuable, particularly in so far as they call for the machines being brought up to and moored to their buoys without any outside assistance.

These are purely matters of the technique of design, however, and the seaplane tests show no more idea of encouraging economical design than do the aeroplane tests.

The very allocation of twice as large an amount of prize-money for aeroplanes as for seaplanes, in a country like England, is in itself evidence of an absence of vision on the part of those responsible for the drawing up of the rules.

The Neglect of Seaplanes.

Great Britain, with its unequalled network of roads

and railways, is one of the most unpromising of countries for the development of overland aerial transport.

On the other hand, its island condition, the lack of direct communications along the coast-line, and the enormous cross-seas traffic with the Continent render it one of the most promising fields for the intelligent exploitation of seaplane services.

It would seem reasonable, therefore, to have devoted special attention to seaplanes, particularly as during the war seaplanes have been almost entirely neglected; but it may be assumed that, as seaplane manufacturers have been very nearly extinguished in this country, the Air Ministry has considered it safe to treat them with even more contempt than their slightly more vigorous brethren who build aeroplanes.—W. H. S.

EXHIBITION FLYING IN U.S.A.

The Director of Air Service, Washington, U.S.A., issued the following on July 22nd :—

"With the immense popular interest in flying together with the difficulties of living up to the common expectation and the technique of flying, it is remarkable that more accidents have not occurred through the use of makeshift fields. During the Victory Loan Campaign, teams of aviators, flying various types of high-powered, high speed machines, including even captured enemy Fokkers, covered almost the whole United States with the shadow of their wings, sustaining but one accident, and that to a spectator. Flights were made in 88 cities, utilising such fields in the vicinities as happened to be available."

THE "DAILY EXPRESS" PRIZE.

The Advisory Committee on the "Daily Express" £10,000 reliability prize, held its preliminary meeting on Aug. 22nd. The Committee decided to meet again on Aug. 29th, and will then announce the date on which entries will be officially received. Meanwhile, the Committee agreed to the extension of the closing date from June 1st to Oct. 31st, 1920.

Among those present were Brig.-General Sir Capel Holden, C.M.G., D.S.O. (Chairman); Lieut.-Col. F. K. McLean, D.S.O.; Lieut.-Col. A. Raikes, D.S.O.; Capt. G. Mansell; Capt. P. D Acland; Mr. A. Allen; and Mr. H. E. Perrin.

The R34 (1,950,000 cu. ft.; five 250-h.p. Sunbeam "Maori" engines) flying at Pulham Aerodrome, Norfolk. Below is the R24 (924,000 cu. ft.; four 250-h.p. Rolls-Royce engines) moored to a mast during mooring tests.

THE OFFICIAL BRITISH AIRCRAFT COMPETITION

The Air Ministry makes the following announcement:—

A Committee composed of members of the Air Ministry and of the Aviation Industry has been sitting for the past two months under the chairmanship of the Under Secretary of State for Air to consider the question of encouraging the future development of aviation on the lines of increased safety. A large number of witnesses has been called, including constructors and designers and representatives of the public who are interested in aviation. It has been decided, as stated in Parliament, to institute a competition open to the British Empire. Prizes to the value of £64,000 will be awarded by the Government under the conditions which are set out below.

Rules for a Competition for Aircraft to further the Attainment of Safety of Air Travel.

Notes on the Competition.

(a) The aim of these competitions is to obtain a real advance in the efficiency and design of aeroplanes and seaplanes, more especially with the view of increasing the safety of air travel. The rules drawn up are intended to secure this object.

(b) As regards the rules for aeroplanes it is recognised that the conditions are, generally speaking, easier for the small machine than for the large. The object in this is to attract a large number of competitors from amongst designers of small machines.

(c) The present competitions are not directly aimed at engine reliability, nor at economy in fuel and oil consumption, although these are of the first importance, but chiefly at the attainment of efficiency in the machine itself. A much longer time is required to produce radical improvements in engines than in machines, and since it is intended that the present competitions should be held early next year, it has been decided to concentrate attention on the machine on this occasion.

Rules.

Aeroplanes.

1. A competition will be held commencing on March 1st, 1920, with the object of ascertaining the best types of aeroplanes which will be safe to travel in, and, in particular, be capable of alighting in and rising from a small space.

2. Two types of aeroplanes will be entered for the competition.
   (a) Small type with a total carrying capacity of two persons (including pilot).
   (b) Large type with seating accommodation for 15 persons (exclusive of crew).

3. Machines and engines must have been designed and constructed within the British Empire. This rule will not, however, apply in the case of such secondary equipment as ignition system carburetters and instruments.

4. Machines are to fulfil all conditions required for a certificate of airworthiness, and are to carry parachutes for all persons for whom accommodation is provided, including crew.

5. Each machine must be capable of flying level at or above the following speeds with full load at ground level:—

Small Type.—100 m.p.h. Large Type.—90 m.p.h.

and must also be capable of flying level at or below the following speeds with full load at ground level:—

Small Type.—40 m.p.h. Large Type.—45 m.p.h.

Each machine must also be capable of climbing not less than:—

Small Type.—500 ft. in the first minute, starting from ground level.

Large Type.—350 ft. in the first minute, start from ground level.

6. Landing and Getting off Test.
   (a) A circle will be marked out on open ground to represent a field surrounded by obstacles. This circle will be of the following diameter:—
   Small machines ..... 175 yards.
   Large machines ..... 275 yards
   The obstacles will be represented by a continuous string or tape with streamers attached, 50 ft. from the ground, of such a nature as to be easily broken by an aeroplane.
   (b) The landing to be made in still air. Still air includes any wind not exceeding 5 miles per hour at ground level.
   (c) During landing the machine is not to side slip nor to turn, after reaching the obstacles until it is on the ground. Once it has touched the ground the machine may turn in any direction.
   (d) The machine to come to a standstill before reaching the marks representing the boundary of the field.
   (e) After landing, the machine to get out of the same field over the 50 ft. obstacle in still air (as defined in sub para. (b), no turn to be allowed until clear of the obstacle on the far side.
   (f) No breaking device operated by the engine may be used during landing.
   (g) Any landing or taking off gear used must be integral with the machine.
   (h) No landing apparatus may be used that in the opinion of the judges would be liable to cause undue damages to an aerodrome, e.g., a claw attached to the machine as used on certain types of German machines would not be allowed, but the ordinary knife edge on a tail skid would be allowed.
   (j) Both landing and taking off to be with full load.
   (k) Each machine will be allowed two trial attempts (which are definitely not to be counted as tests), and thereafter will be allowed four attempts, of which two must be successful.

7. Reliability Test.
   (a) In the case of the small type, each machine must carry out a series of two flights of 3½ hours each at a speed, through the air, of not less than 80 miles per hour, starting with full load. Between flights machines will be left untouched, and under seal if necessary, a period of not more than 30 minutes being allowed before the second flight, for the purpose of filling up and normal examination.
   No parts of the machine to be adjusted or changed without permission from the judges.
   (b) In the case of the large type, each machine must carry out one flight of seven hours' duration at a speed, through the air, of not less than 75 miles per hour, starting with full load. Pilots may be changed during those flights.

8. Machines must be capable of landing from a height of 500 ft., with their engines switched off or completely throttled down.

9. In a machine having two or more engines, the stoppage or retardation of any one engine must not prevent the machine from flying level nor cause it to get out of control.

10. Machines must be capable of being started from the cockpit or cabin without undue muscular exertion on the part of the pilot.

11. Machines to be capable of flying at cruising speed for 5 minutes without the use of any controls or stabilising devices. Controls may be locked during this test.

12. Machines to be capable of standing unattended and not fastened down in a wind of 10 miles per hour, blowing in any direction with reference to the machine.

13. The design of the machines to be such that the risk of the machines turning over on a rough ground is reduced to a minimum.

14. Each machine to be provided with a complete outfit for pegging it out in the open. This outfit will not be carried as part of the load during tests.

15. In order to be eligible for prizes, machines must fulfil the conditions and tests laid down in Rules 3 to 14 inclusive. Marks will be awarded for soundness and quality of construction, for general features and for exceeding the specified requirements in Rules 5 and 6.

16. "Soundness and quality of construction" will include:—
   (a) Fire protection, including use of self-sealing tanks, position of tanks (from the point of view of safety from fire in event of a crash), fire-fighting appliances and accessibility of same.
   (b) Reliability of petrol, oil, and water systems; and facilities for seeing if all tanks are full.
   (c) Durability of machine, including propeller (any advantages due to metal construction may be taken into account).
   (d) Simplicity of design and accessibility of parts.
   (e) Absence of vibration in the machine.

17. "General features" will include:—
   (a) Efficiency and ease of control.
   (b) Unrestricted field of view to the front for the pilot
   (c) Silence as affecting occupants of the machine, including crew.
   (d) Comfort generally, including warmth.
   (e) Self-starting devices.
   (f) Method of wind screening adopted.
   (g) Convenience for use of instruments.
   (h) Freedom of entry and exit for occupants.

18. With reference to rule 6, marks will be allotted for the capabilities of machines to land in an area more restricted than that used for the tests.

In judging this, the point vertically below the point where the centre line of the machine crosses the tape will be marked on the ground and the maximum distance reached by the wheels of the undercarriage will be measured in a straight line from this point.

19. Marks will be allotted for exceeding the minimum high speed and for flying less than the maximum low speed.

20. The judges will have regard to the method of fitting parachutes and especially to the means of exit by parachute afforded to the occupants of the large machine, and will allot marks for the same.

21. Marks will be allotted for the convenience of pegging out the machine in the open and for the lightness of the apparatus necessary for pegging down.

22. Marks will not be given on account of the number of engines installed.

CIVIL FLYING

WITH

THE SOPWITH "DOVE" 2-SEATER SPORTING MODEL

COMFORT AND ECONOMY

The Sopwith "DOVE" is a sporting and utility aeroplane, based, in point of design and general arrangement, upon the famous Sopwith "PUP."

With its fast climb, high-speed, quick manoeuvrability and wide-speed range it is an ideal safety-first pleasure aircraft.

Full details of performance and appointments for demonstration on application to

Paris Office: 21, RUE DU MONT THABOR. Telephone: Central 80.44.
Australia: THE LARKIN-SOPWITH AVIATION CO. OF AUSTRALASIA, LTD.,
18, GURNER STREET, ST. KILDA, MELBOURNE.

23. The following will be the allotment of marks.—
Soundness and quality of construction (Rule 16).—Sub-para. (a), maximum 8; (b) maximum 8; (c) maximum 6; (d) maximum 6; (e) maximum 4. Maximum total, 32.
General features (Rule 17).—Sub-para. (a) maximum 6; (b) maximum 6; (c) maximum 6; (d) maximum 5; (e) maximum 5; (f) maximum 3; (g) maximum 3; (h) maximum 2. Maximum total, 36.
High speed.—For each m.p.h. in excess of required minimum (Rule 5), ½. No maximum.
Low speed.—For each m.p.h. below required maximum (Rule 5), 1. No maximum.
Landing.—For every complete 3 yards less than the distance allowed in 175 yards for small and 275 yards for large machine (Rules 6 and 18), 1. No maximum.
Method of fitting parachutes (Rule 20); maximum marks, 5.
Convenience of pegging-out (Rule 21); maximum marks, 3.

FORFEITURE OF MARKS.

Adjusting or changing parts in reliability test. See Rule 7 (a); maximum marks, 8.
For every two minutes or portion of two minutes in excess of the maximum time allowed for filling—1 mark. See Rule 7 (a); maximum marks, 8.

24. With reference to Rule 6, when carrying out the landing and getting-off test, machines will start with the full load of petrol and oil and will be allowed to fly for 20 minutes. If they have not carried out their tests by the end of that period they must land and fill up again.

25. The type of propeller used on any machine must be the same for all the tests.

26. Full load is to include:—
Instruments as under
Revolution counter; aneroid; air speed indicator; turn indicator; compass; watch; oil pressure gauge (when necessary); air pressure indicator (when necessary); radiator thermometer (when necessary).

SMALL TYPE.—Petrol and oil sufficient to fly 450 miles at 3,000 ft. In addition, a load of 440 lb., to include weight of pilot and passenger, if carried, and parachutes.

LARGE TYPE.—Petrol and oil sufficient to fly 600 miles at 3,000 feet. In addition, a load of 3,000 lbs., to include weight of passengers, if carried, and also to include parachutes, but not to include the weight of crew.

27. Petrol and oil for the tests and, as far as possible, accommodation (at owner's risk) for the machines will be supplied free by the Government.

28. The judges shall have the right to disqualify any machine that is very seriously defective in any respect.

29. The judge shall have the right to put up a Service pilot to fly any of the machines should they consider it desirable to do so at Government risk.

All tests will, however, be carried out by the entrant's pilot.

30. During or on completion of any flying test if it is necessary to effect any repairs to the machine after landing, it will be considered to have failed in that particular test.

This does not apply to cases where the machine is by the judges' instructions being flown by the pilot other than the entrant's pilot.

31. Any entrant may enter more than one type of machine.

32. If a machines is wrecked during the competition, it may, at the discretion of the judges, be replaced by another, but the replacement machine must carry out the whole programme of tests.

33. The decision of the judges shall be final in all matters affecting the competition.

34. The Government do not accept any liability in respect of accidents during the competition, whether resulting in injury to personnel or damage to the machine, except as specified in Rule 29.

35. The Government reserve the right to adjourn the competition.

36. The Government reserve the right to withhold any or all of the prizes if, in the opinion of the judges, no real advance on existing designs is shown.

37. The Government will, if the entrant agrees, buy the machine of each type winning the first prize, the designs to remain the property of the manufacturers. The maximum prices payable under this head will be:—
SMALL TYPE.—£4,000. LARGE TYPE.—£10,000.

38. The following prizes are offered:—
SMALL TYPE.—1st prize, £10,000; 2nd, £4,000; 3rd, £2,000.
LARGE TYPE.—1st prize, £20,000; 2nd, £8,000; 3rd, £4,000.

39. Entries to close Dec. 31st.

Rules.

SEAPLANES.

1. A competition will be held on March 1st, 1920, with the object of ascertaining the best types of Float Seaplanes or Boat Seaplanes in which it will be safe to travel, and, in particular, to be capable of alighting on and arising from land as well as water.

2. Each machine entered for the competition will be provided with seating accommodation for four persons, exclusive of the crew.

3. Machines and engines must have been designed and constructed within the British Empire. This rule will not apply in the case of such secondary equipment as ignition system carburetters and instruments.

4. Machines to fulfil all conditions required for a certificate of airworthiness, and to carry parachutes and lifebelts for all persons for whom accommodation is provided, including the crew. The boat or floats must be so sub-divided that if perforated in any one part, each float still retains positive buoyancy.

5. Each machine must be capable of flying level at or above a speed of 80 knots with full load at sea level, and must also be capable of flying level at or below a speed of 40 knots with full load at sea level.

Machines must be capable of climbing not less than 350 ft. per minute.

6. ALIGHTING AND GETTING OFF TESTS.

(a) Getting off test (sea).

Machines will be required to take off with full load and clear an obstacle 25 ft. above sea level in a distance not exceeding 300 yards from a position of rest.

(b) Alighting test (land).

Machines will be required to land on a smooth aerodrome over an obstacle 25 ft. in height and to come to rest in a distance not exceeding 400 yards, measured in a straight line from the point where the obstacle is crossed. For this, test machines will be required to carry full load, less 50 per cent. total and oil.—[*sic.*—Ed.].

(c) Getting off test (land).

Machines will be required to take off a smooth aerodrome with full load and clear an obstacle 25 ft. in height in a distance not exceeding 400 yards from a position of rest.

(d) The above tests are to be made in still air, which, for the purposes of this competition, will be regarded as any wind velocity not exceeding five statute miles per hour.

(e) During landing the machine is not to side-slip nor to turn after reaching the obstacle until it is on the ground. Once it has touched the ground the machine may turn in any direction.

(f) No braking device operated by the engine may be used during landing.

(g) Any landing or taking off gear used must be integral with the machine.

(h) No landing apparatus may be used that in the opinion of the judges would be liable to cause undue damage to an aerodrome.

(i) In test (a), (b), and (c) above, machines will be allowed four attempts, of which two must be successful.

7. TEST OF RELIABILITY IN FLIGHT.

(a) Each machine must carry out a flight of five hours at a speed through the air of not less than 70 knots, starting with full load.

Pilots may be changed during this flight.

8. MOORING OUT TESTS.

(a) Fair weather. Each machine will be moored to a buoy by its own crew and using its own mooring tackle (other than the buoy and its moorings) for a period of 24 hours, during the first 23 hours of which time it will be left unattended. The crew will not be allowed on board to pump out the bilges at any time during this test except with the permission of the judges in case of emergency.

At the conclusion of the 24 hours' period the crew will be allowed on board the machine and will be got under way by its own crew and under its own power, and will be required to carry out a short flying test within a period of one hour from the conclusion of the 24 hours' period.

The test will be carried out under fair weather conditions. Marks will be allotted for rapidity in getting under way.

Moderate weather. Each machine will be moored to a buoy for a period of not less than 12 hours, unattended under the following conditions:—

Locality.—Roadstead sheltered from the open sea.

Wind.—From 4 to 6 on the Beaufort Scale.

Marks will be allotted for the general condition of the machine at the conclusion of this test, and its behaviour during the test.

In both the above tests the ordinary average tidal currents existing round the coast of the British Isles may be experienced.

9. Rough water getting off and alighting test.

Each machine will be required to carry out a test of getting off and alighting on disturbed water, which, in the opinion of the judges constitutes a moderate sea. The condition, in any case, will not exceed state four in the sea disturbance scale. (Waves under 4 ft. in height).

10. Machines will be required to carry out a test of being

MARTINSYDE

towed in a moderate sea as defined in paragraph (9) in a circle of approximately ½-mile radius.

11. Each machine must make a figure of eight course round two buoys 100 yards apart and within a rectangle measuring 200 yards by 100 yards, in a wind not exceeding 15 m.p.h. The sea to be smooth and the tide at slack water.

12. Each machine must be capable of moving on the water, under its own power, for a period of at least 30 minutes, and at a speed of not less than 10 knots, and not greater than 20 knots.

13. Each machine will be required to carry an anchor and sea anchor as well as its own mooring tackle, and to anchor on good holding ground with its own gear, and remain fast in a wind of 10 m.p.h. and with tidal current not exceeding 3 knots.

14. In a machine having two or more engines, the stoppage or retardation of one engine must not cause the machine to get out of control.

15. Machines must be capable of flying at cruising speeds for three minutes without the use of any control or stabilising devices. Controls may be locked during the test.

16. Machines, in the round flying position, must take up and maintain a gliding angle, when the engine or engines are cut off without the use of any controls or stabilising devices.

17. After stalling (1) machines must be capable of recovering flying speed and complete control without a loss of more than 500 feet of height.

18. Machines must be capable of being started from the cockpit or cabin, without undue muscular exertion.

19. (1) In order to be eligible for prizes machines must fulfil the conditions and carry out the tests laid down in paragraphs 2 to 18 inclusive. Marks will be awarded for soundness and quality of construction, for general features, for general behaviour afloat, and for exceeding the specified requirements in Rules 5 and 8 (a).

20. (2) Soundness and quality of construction will include :—
- (a) Fire protection, including use of self-sealing tanks, position of tanks (from the point of view of safety from fire in event of a crash), fire-fighting appliances and accessibility of same.
- (b) Reliability of petrol, oil and water systems, and facilities for seeing if all tanks are full.
- (c) Durability of petrol, oil and
- (c) Durability of machine including propeller (any advantages due to metal construction may be taken into account).
- (d) Simplicity of design and accessibility of parts.
- (e) Absence of vibration in the machine.
- (f) Ease of repair, especially in regard to the hull or floats.

21. (iii) General features will include :—
- (a) Efficiency and ease of control.
- (b) Unrestricted field of view to the point [? front] for the pilot.
- (c) Silence as affecting occupants of the machine.
- (d) Comfort generally, including warmth.
- (e) Self-starting devices.
- (f) Convenience of mooring and anchoring arrangements.
- (g) Method of wind screening adopted.
- (h) Convenience for use of instruments.
- (i) Freedom of entering and exit for occupants.
- (j) Bilge pumping arrangements.

22. Behaviour afloat will include :—
- (a) Stability at rest.
- (b) Water stability at all speeds.
- (c) Minimum spray at all speeds.

23. Marks will be allotted for exceeding the minimum high speed and flying less than the maximum low speed.

24. The judges will have regard to the method of fitting parachutes and especially to the means of exit by parachute afforded to the occupants and will allot marks for the same.

25. Marks will not be given on account of the number of engines installed.

26. The following will be the allotment of marks :—

Soundness and quality of construction (Rule 20).—Sub-para. (a) 8; (b) 8; (c) 6; (d) 6; (e) 4; (f) 4; maximum total, 36.

General features (Rule 21). Sub-para. (a) 6; (b) 6; (c) 6; (d) 5; (e) 5; (f) 5; (g) 3; (h) 3; (i) 3; (j) 3; maximum total 45.

Behaviour afloat (Rule 22).—Sub-para. (a) 6; (b) 6; (c) 6; maximum total, 18.

High speed (Rule 5).—For each knot in excess of required minimum, ½; no maximum.

Low speed (Rule 5).—For each knot below the required minimum, 1; no maximum.

Mooring-out test (Fair Weather) (Rule 8a).—For each complete 5 minutes less than the hour allowed from the completion of the 24-hour period to the moment when the machine leaves the water; 1 mark.

Mooring test in moderate weather (Rule 8b).—For behaviour of machine during test; maximum marks, 5.

For condition of machine at end of test; maximum marks, 5.

Method of fitting parachute (Rule 24); maximum marks, 5.

27. With reference to Rule 6, when carrying out alighting and getting-off tests machine will start with the load of petrol and oil specified and will be allowed to fly for 20 minutes. If they have not carried out their tests by the end of that period, they must alight and fill up again.

28. The type of propeller used on any machine must be the same for all the tests.

29. Full load will include :—

Instruments as under :—Rev. counter, aneroid, air speed indicator, compass, watch, turn indicator, bearing plate, sextant, oil pressure gauge (when necessary), air pressure gauge (when necessary), radiator thermometer (when necessary).

Petrol and oil sufficient to fly 450 nautical miles at 1,000 ft.

In addition a load of 1,000 lb., to include passengers if carried, and lifebelts and parachutes, but not including crew or any gear specified in Rules 8 (a) and 13.

30. Petrol and oil for the tests, and, as far as possible, accommodation (at owner's risk), for the machines will be supplied free by the Government.

31. The judges shall have the right to disqualify any machine which is very seriously defective in any respect.

32. The judges shall have the right to put up a Service pilot to fly any of the machines, should they consider it desirable to do so at Government risk.

All tests will, however, be carried out by the entrant"s pilot.

33. During or on completion of any flying test if it is necessary to effect any repairs to the machine after alighting it will be considered to have failed in that particular test.

This does not apply to cases where the machine is by the judges' instructions being flown by a pilot, other than the entrant's pilot.

34. An entrant may enter more than one type of machine.

35. If a machine is wrecked during the competition, it may, at the discretion of the judges, be replaced by another, but the replacement machine must carry out the whole programme of tests.

36. The decision of the judges shall be final in all matters affecting the competition.

37. The Government do not accept any liability in respect of accidents during the competition, whether resulting in injury to personnel or damage to the machine (except as specified in Rule 32).

38. The Government reserves the right to adjourn the competition.

39. The Government reserve the right to withhold any or all of the prizes if, in the opinion of the judges, no real advance on existing designs is shown.

40. The Government will, if the entrant agrees, buy the machine winning the first prize, the design to remain the property of the manufacturer. The maximum price payable under this head will be £8,000.

41. The following prizes are offered :—1st prize, £10,000; 2nd prize, £4,000; 3rd prize, £2,000.

42. Entries to close Dec. 31st.

[The eccentricities of style and grammatical construction are those of the Air Ministry officials who drafted the rules. The curious sub-paragraphing of paragraphs 19, 20 and 21 of the Seaplane Section is also to be attributed to the same source.—Ed.]

MORE PRIZES OFFERED.

It is announced that the French Government has allotted some £8,000,000 to commercial aviation. Prizes will be awarded to companies establishing air lines (1) in France, for lines going East to West; (2) for Colonial lines connecting France and the colonies; (3) for Colonial lines opening communication with distant points in the interior.

The Control Board undertakes the preparation and equipment of landing stages to be established every 50 or 60 kilometres. According to their importance, these aerodromes are to be classified as "air ports" (for the reception of every type of flying machine), "air stations" (with hangars, hotels, etc.), or "stops" (for revictualling).

THE TRANS-PACIFIC RACE.

The Aero Club of America announces that aviators who wish to enter for the trans-Pacific Race in September, for which Thomas H. Ince has offered a prize of £10,000, should make application to any club affiliated with the Federation Aeronautique Internationale. The entrance fee is 500 dollars.

If westward, the flight must be made from Venice, California, and the finish be in Australia, Japan, the Philippines, or the Continent of Asia. But it may be made eastward from any of these places.

Contestants must complete the flight within 288 hours from the time of starting. Ninety-five per cent. of the mileage travelled must be in the air. Towing is not prohibited, and stops and landings may be made en route.

In the event of no contestant being able to complete the flight, 10,000 dollars will be awarded to the aviator who, setting out from the Californian starting-place, reaches the Hawaiian Islands in the shortest time. Should no contestant succeed in reaching these islands, 5,000 dollars will be awarded to the aviator flying farthest in the air.

The Quality of the Material.

THE material has been selected as a result of the experience gained in designing and producing the largest output of aero engines during the war and in many years of motor car building.

Each and every part—be it of steel, aluminium, cast iron or other material—has its own peculiar duty to perform and stresses to resist. These have been most carefully considered and enumerated before the material best suited to the purpose has been selected.

Crankshafts, differential shafts and other similar parts subject to bending and twisting stresses, are made of a special selected nickel chrome steel, heat treated to enhance its natural qualities.

Other parts—such as gears—must have a hard surface and yet not liable to chip. For these a special air-hardening nickel chrome steel with a tensile strength or resistance to fracture of over 100 tons per square inch has been adopted.

Engine connecting rods and front axles must bear heavy loads and resist severe shocks. For these a special steel able to withstand such stresses has been chosen.

All of the material conforms to British Engineering Standard Association's specifications. It is made to guaranteed analyses and tests, and is check tested in our own laboratory.

In its selection cost has not been counted; quality and suitability alone have been considered. By using only materials of the highest quality we are able to so reduce weight and simplify design that, with the aid of our experience in quantity production by the most enlightened methods, the price of the chassis is brought down to a moderate figure which would otherwise be unattainable.

A DANGEROUS POLICY.

By Captain P. A. BARRON (late R.A.F.).

The aeronautical correspondent of the "Times" has commenced a series of articles, the first of which is entitled "A Policy for Aviation." With most of the views expressed one disagrees with whole-hearted enthusiasm. The articles show that considerable thought has been given to the subject—just as one might say that the answer of a schoolgirl indicated thoughtfulness when she was asked whether a kiss was a common noun or a proper noun, and answered that it might be either common or proper according to the circumstances.

The danger of these articles that look so reasonable is that they are extremely likely to influence the opinion of the public that is not in a position to judge whether the premises upon which the arguments are based are sound. With all due deference to this writer, much of whose work one admires, it seems necessary, therefore, to criticise his views. In last week's issue of The Aeroplane it was pointed out that the proposal to allot a sum of £25,000,000 per annum to the upkeep of the R.A.F. showed lack of forethought, and that the sum would be entirely inadequate to the needs of the Empire. This writer in the "Times," however, calmly suggests that the maximum expenditure need not be more than £15,000,000 a year for all Government aviation for the next three or four years, and he suggests that of this sum only £12,000,000 would be necessary to provide for a force of 25 squadrons on a permanent basis.

He suggests the allocation of £1,000,000 per annum for the next five years, which would be distributed in prizes to civilian manufacturers, and that another £2,000,000 could be usefully employed by the Air Ministry on postal services with those parts of the Empire where Service squadrons are required strategically.

One feels strongly opposed to these views, because one sees clearly that a certain section of the Press to which the "Times" belongs is likely, in carrying out the policy of crying for a reduction in national expenditure, to go too far and to show an utter lack of discrimination in its efforts to point out where money can be saved advantageously, and where it cannot be saved without disastrous effects in the future.

Mental Equilibrium Needed.

At the present time, while the country is groaning under the burden of a ponderous income tax, and when most business men feel that the task of reconstruction is almost as hopeless as that of Sisyphus toiling at his rock, it is perhaps understandable that any proposition that appears likely to reduce expenditure will be received favourably by the public. One expects, however, that papers which at one time were regarded as authoritative should retain a certain amount of sanity in dealing with present-day problems. The scheme put forward does not give one the impression that this desirable state of mental equilibrium exists.

If one has understood the views expressed, it appears to be thought that the R.A.F. can be almost neglected and that the Government should encourage the development of Civil Aviation in order that a Reserve Force may be built up somewhat similar to the reserve formed by the Mercantile Marine. It is argued that "the initial stages . . . of the training of pilots and navigators are identical for both Civil and Service personnel, and that all that the Service personnel need is additional specialised training. All training for both types of pilots should be carried out at the same schools with the same instructors, the permanent Service pilots merely going on to purely Service schools for advanced training."

One can only say that one does not agree. On the same line of argument one might say that every boy in England who wishes to make the sea his career should go to the Royal Naval College, and that after receiving instruction there those who desire to enter the Royal Navy should receive a little extra education, while the remainder would go into the Mercantile Marine. One disagrees with this view because one knows that the training of the boys who enter the Royal Navy is entirely different from that of others who enter the Mercantile Marine. And exactly the same thing would apply in future to those who enter the career of Commercial Aviation and those who wish to serve their King.

A Mistaken Idea.

One is not saying that the personnel to be found in Commercial Aeronautics in the future will not be a great asset to the country. One realises that it will; exactly as the personnel of the Mercantile Marine was an enormous asset to the Royal Navy in war-time. It will form a great reserve, but one feels strongly that the idea that the same schools will serve for both Civil and Service pilots is a mistaken one.

But it is when one turns from the subject of personnel to that of equipment that one finds oneself most strongly in disagreement with the aeronautical correspondent of the "Times." For example, he writes: "Most types of civil aircraft as they develop will be capable of conversion into war craft comparatively easily." Now this is one of those statements which are so apt to mislead the public, who still believe—for their fathers have told them—that the "Times" is a journal that speaks with authority, and they are therefore not likely to question such statements as these.

But let us examine it in the light of our faith in future aeronautics. Is it probable that civil aircraft as they develop will be capable of conversion into war aircraft comparatively easily? One must at least be allowed to doubt. For instance, among the qualities required for war machines are rapid climb, high ceiling, and manœuvreability. As one is writing for a technical audience, one need not explain why.

Are these qualities required to the same extent in commercial aircraft, in which it would appear that the greatest desiderata are speed, cargo-carrying capacity, and economy? A moderately high ceiling may be necessary in order that navigators may find a favourable weather stratum, but, judging by what we know of the very rapid progress that has been made in the development of anti-aircraft guns, one thinks that it will be far more important for Service machines to attain a great height rapidly than it will be for machines designed for purely commercial purposes. Again, what immediate use can one see in Civil Aeronautics for the fast single-seater fighting machines which played so great a part in the closing months of the war? The answer would appear to be none.

Truth May Become Untruth.

In these days of rapid change one feels it necessary to express one's ideas with considerable diffidence. Certainly one does not wish to be dogmatic. For a truth too vigorously expressed may become an untruth. A lie has been prettily defined as "an abomination in the sight of the Lord, but a very present help in time of trouble"—which means, presumably, that it is a useful thing to hurl into an argument when one finds oneself in a tight corner.

GILBERT CAMPLING, LTD.
(Members M.T.A.)
1, Albemarle Street, Piccadilly,
LONDON, W.1.

At this stage one is merely inclined to say that it is a very dangerous proposition to state that commercial aircraft and fighting aircraft are likely to develop upon the same lines. To fall back on analogy one feels that upon a similar argument the less-educated section of the British public might have been induced to believe that because we had the greatest Mercantile Marine in the world a Fleet was unnecessary, and there might be a certain number of people who would be induced to think that it would pay us better to subsidise liberally a Merchant Fleet and let the Navy go. The more enlightened would think differently, knowing that the two are distinct and in war have entirely separate uses.

Commercial aircraft may prove an asset of incalculable value in war, just as did our Mercantile Fleet, although one would not send out Atlantic liners to fight enemy Dreadnoughts. By all means let Commercial Aeronautics be encouraged, but not by starving the R.A.F.

In a second article the aeronautical correspondent of the "Times" calls for an entirely new organisation with many responsible official positions. With this one may perhaps deal on a future occasion. For the present one has said enough.

Fiat justitia, ruat cœlum. One trusts that one has misjudged or misread some of the views expressed in the "Times." One can only say that one has studied them, and that, if the points mean what they seem to mean, one is in entire disagreement with the views expressed.

MISDIRECTED CRITICISM.

A lot of hysterical nonsense has appeared in the daily Press recently with regard to Lord Midleton's accusations of Governmental waste of money at the Dorchester aerodrome.

Upon the principle that any stick is good enough to beat a dog with, the papers belabour the Government (1) for building a great airship shed on farm land that was yielding good crops; (2) for paying unreasonably high wages to workmen; (3) for not paying the owner of the land—an apparent attempt at economy; (4) for leaving the great steel and corrugated iron building unfinished; (5) for not pulling it down, and so on.

The fact is, of course, that the country is at present in a panic over the expenditure on the war, and that anyone who wishes to make a bid for popularity has only to accuse the Government of wicked waste to achieve his object. That money has been squandered recklessly everybody knows, but the critics are not happy at the examples they bring forward.

In this particular case the Admiralty appear to take the view that it would be less costly to finish the great building than to demolish it. If it is demolished the entire cost, exclusive of the comparatively small amount the materials might realise, would be a dead loss to the country. If, on the contrary, the building is completed and the landing ground prepared as originally intended, the country will have as an asset one of the finest aerodromes for airships in the world. If it is pulled down now, it will certainly be necessary to erect a similar building in a few years' time.

As one said before, the examples of waste that are brought forward are badly chosen. One could almost believe that everybody concerned is in a conspiracy to divert public attention from the greater scandals by focussing the electors' thoughts on the minor ones which rhetorical Ministers can prove are not scandals at all but are evidence that we have the best of all possible Governments in the best of all possible worlds.

Let the critics demand to know why hundreds of the best of our pilots were literally sent to certain death by the blundering attempts of the Technical Department to foist inferior machines and engines on the R.F.C. and refuse the infinitely superior products of private enterprise. Let them look to the things that really matter, discover the great criminals and demand that a few of them be shot if necessary, but this mean quibbling over comparatively small matters leads nowhere.—P. A. B.

MAJOR-GENERAL SEELY'S DEFENCE.

The statements made by Major-General the Right Hon. J. E. B. Seely, C.B., C.M.G., D.S.O., M.P., in the House of Commons, in reply to the charges of extravagance, have been criticised severely. A correspondent of the "Times" writes regarding the alleged waste at Blandford:—

"Indignation is expressed at the suggestion that there is no room in the camp to house the girls who are engaged as clerks in the Records Office, and that it is necessary to convey them by train from and to Bournemouth every day. A walk round the camp shows that, in addition to numerous unoccupied huts, there are blocks of brick and concrete buildings of a permanent character standing empty, and suggesting in themselves a solution of a fair-sized housing problem. In fact, over a wide expanse of hutments to the east of the camp railway terminus there are only one or two occupied huts to be seen.

"With regard to the cost of transporting some 400 girl clerks daily from and to Bournemouth, Major-General Seely denied that the cost per head per day was 4s. 7½d., and submitted as the true cost the figure of 11½d. The ordinary passenger who wishes to visit Blandford from Bournemouth is required to pay 4s. 7½d. for his return ticket. If the Air Force pays at the rate of only 11½d., who pays the difference? According to Mr. Lloyd George, there is no doubt that the railways at the present moment are run at the expense of the State, so, no doubt, the taxpayer pays the difference, and enables the Air Force to commend itself for its economy."

Some Officers of the U.S. Army Air Service serving in France towards the end of the War.

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

The Schneider Cup Race.

In last week's issue the British entries for the Jacques Schneider International Race were announced. The Royal Aero Club has now received particulars of the French and Italian entries. They are:—

Two Nieuport machines with 300 h.p. Hispano-Suiza engines. The pilots are Malard and Casale.

One Spad (type of engine not stated). Pilot, Sadi LeCointe.

The Italian entry is a Savoia hydroplane type S.13 single-seater, with a 250 h.p. Isotta engine. Pilot, Janello.

The Royal Aero Club is making arrangements for members to have a reserved enclosure at the end of Bournemouth pier from which a full view of the race may be obtained.

Members who require tickets should apply to the Secretary, Royal Aero Club. As already announced, the race will take place on Wednesday, Sept. 10th.

The Sopwith Schneider Cup Seaplane.

The Sopwith machine entered for the Schneider Cup Race is a small single-seater float seaplane, fitted with a 450 h.p. Cosmos "Jupiter" engine. She follows the usual practice in small float seaplanes, and is more or less a modernised version of the original Sopwith seaplane that won the "Cup" at Monaco in 1914. The fuselage is built up in the usual way, and is faired for about half the length, so as to retain the form of the circular cowl that covers in most of the engine, the circular form gradually giving way to the ordinary slab-sided fuselage which tapers to the trailing edge of the rudder, the base of the rudder, which is directly in rear of the fuselage, being brought up to the thickness of the end of the fuselage and streamlined off. The small fin is also streamlined and built into the top of the fuselage, and hinged to it is a small unbalanced rudder. There is no tail float.

The "Cosmos" engine is bolted direct to the engine-plate, and has four extra attachments in the way of stays leading from the front edge of the crankcase to the engine-plate. There are four tanks carried in the fuselage in front of the pilot, one large one in the fuselage and three smaller ones carried in the streamlining in the top and sides of the fuselage.

The main planes are attached to the sides of the fuselage and the centre section respectively, and have one set of struts either side of the fuselage, the top plane being set at a slight negative stagger. The pilot's seat is in rear of the main planes, and has a streamline hump behind the pilot's head. Two large unstepped floats are fitted to the fuselage by four streamlined struts.

The Avro Schneider Cup Machine.

The machine designed and built by A. V. Roe and Co., Ltd., for the Schneider Cup is the lowest powered of the British entries. Originally designed for a Rolls-Royce "Falcon" engine of 275-h.p. is was found impossible to obtain an engine of this mark in time for the competition, and a Siddeley "Puma" of 230-h.p. was installed in place thereof.

The machine itself is a small tractor twin-float seaplane of 26-ft. span, with a very small chord and gap, an upper wing built as a single unit—i.e., with spars running from tip to tip—and therefore devoid of any dihedral, and a lower wing with rather a large dihedral.

The fuselage is relatively very deep, nearly the full depth of the gap, and rather short, with the pilot's seat behind the trailing edge of the wings. At the rear end tail surfaces of normal design—adjustable tail plane, elevators, fin and rudder—are carried, as is usual.

Two long stepped floats are carried on a very simple chassis, consisting of two struts on each side raking forward and outward and two cross members joining the bases of each pair of struts, the whole cross traced in the usual manner.

No tail float and no water rudder are fitted.

The machine—in an incomplete condition—looks extremely businesslike and promises a very considerable turn of speed.

A detailed description, together with some illustrations, will, it is hoped, be available for publication in the next issue of The Aeroplane.

The Fairey Entry.

The seaplane entered by the Fairey Aviation Co., Ltd., for the Schneider Cup, is a modification of a standard Fairey type 3 machine, fitted with a Napier engine of 450 h.p., and wings of reduced surface. In spite of the reduced area, the load to be carried for the race is so small that the actual loading per square foot will be less than that of the standard type with war load, and, with the larger engine, the speed should be very high. Mr. Fairey, however, does not expect to score particularly on speed pure and simple—though on that alone it will require something very fast to beat him. In the event of the race occurring on a rough day, however, the Fairey chassis and floats should stand the machine in good stead, simply because the machine will be able to get off and land, where a pure racing machine would inevitably crash.

The Supermarine.

At the moment of going to Press no particulars of the machine entered by the Supermarine Co. are available—beyond the fact that it is a single-seat boat seaplane, with a Napier engine of 450 h.p.

From what one has been able to gather of the machines entered, it seems fairly safe to assume that under bad weather conditions the race will not be won at any speed less than 125 m.p.h., and, that given reasonable weather, it will not be surprising if the speed reached is close upon the 150 mark.

Tawdry Recruiting Posters.

A kind of rash has broken out on the hoardings lately, which, when closely examined, is found to be composed of small, vividly coloured posters, calling for recruits for the R.A.F. One had hoped that the blatantly vulgar, coloured recruiting poster of war-time that tried to outshine the advertisements of patent medicines and revues was a hideous memory of the past. Perhaps they served their purpose, but one would think that at the present day a restrained and dignified announcement of the advantages the R.A.F. offers would have been more effective. A straightforward statement of the pay and advantages offered would, one thinks, be more likely to attract possible recruits than a picture of an aeroplane and the poor pun "getting a good rise." Also, one thinks that a sober-hued poster of official appearance would show more prominently among the flaming appeals to buy somebody's soap or pills than the style of thing that has been adopted.

Yet Another Committee.

According to the report of the Departmental Committee on the Protection of Wild Birds issued on Aug. 20th:—

"A new danger to bird life has been introduced by the shooting or bombing of wild birds from aircraft.

"Already considerable destruction has resulted. We recommend that the use of aircraft for killing or taking wild birds should be prohibited."

Many recommendations follow. All the proposed regulations should, it is urged, be committed to the care of an ornithological advisory committee, who should furnish all necessary advice.

This sounds very alarming, but one has not heard that the bombing of grouse has become a pastime in this country?

Landing on a Roof.

It is reported from New York that Edwin Ballough, a pilot of an aeroplane used for delivering goods by Bamberger, proprietor of a Newark department store, has performed the feat of landing on a roof and taking off again.

Ballough has thus eclipsed the feat of the late Jules Védrines, who landed on the roof of the Galeries Lafayette in Paris, but was prevented by the police from starting again.

The building on which Ballough descended is a warehouse belonging to the Army Quartermaster's Department. The roof is 978 ft. long with a slight peak.

No. 32 Squadron Reunions.

In order that old members of 32 Squadron may not lose sight of one another it is proposed that occasional reunions may be held. Lieut.-Col. T. A. E. Cairns, D.S.O., has accepted the presidency of the Club, the headquarters of which are at 30, Bedford Row, London, and Mr. P. P. Nicholl, of that address, is acting as Secretary, and will be glad to hear from ex-members of the Squadron.

An Absurdity.

At the R.A.F. Club the other day a member tried to pull the blue-trousered leg of a Major who has only just returned to England by telling him that an order is shortly to be issued to make it compulsory for all commercial aeroplanes to carry red rear lights. He explained that the Authorities had decided that this is the logical outcome of the recent decision that it is the fastest vehicles that need rear lights as they are rarely overtaken, whereas country carts and pedal bicycles which are passed by every car do not need protection. The Major made quite an interesting little speech on the text of "the d—— silliness of everything" before it dawned upon him that so far as the red lights on aeroplanes were concerned he had been badly stung.

The WORLD of AERONAUTICS (continued)

The London-Madrid Non-Stop Flight.

The Air Ministry has issued the following :—

The pilot's report of the recent non-stop record flight from London to Madrid made by the Alliance biplane shows that the flight was remarkable in many ways. This machine, which was fitted with a 450 h.p. Napier "Lion" engine, was originally designed for the trans-Atlantic flight. The pilot and navigator Lieut. W. R. Curtis, R.A.F., was lent by the Air Ministry to the Alliance Company for the purpose of making this flight. He had with him Mr. J. A. Peters, the designer, as assistant pilot.

The following notes are taken from the pilot's report :—

"We left Acton Aerodrome at 7.30 a.m., steering a course for Havre. A heavy ground mist made visibility poor, and at times completely obscured the ground from view.

"7.55 a.m., passed over Brighton at 10,000 ft., where visibility improved, until halfway across the Channel, when thick clouds again obscured the water from view.

"8.50 a.m., passed over Havre, which we just sighted through a break in the clouds. Course was altered here for San Sebastian, and we gradually decreased our height to 6,000 ft., flying just below clouds which were very broken.

"At 11.10 we passed over Rochelle; just after leaving this place we ran into very bad weather, the clouds being very thick, and ranging from 2,000 to 10,000 ft. in depth. After having a very bad time in thick clouds we eventually found ourselves at 2,000 ft. flying just below them in most terrific bumps which also made the machine uncontrollable. After experiencing this for some time we decided to go out to sea and get clear of the land.

"Here we found much better conditions, the sky being almost clear. We climbed to 13,000 ft. and passed over San Sebastian at 1.10 p.m. Course was altered for Madrid and the land again became obscured from view owing to very heavy clouds.

"Nothing was seen of the Pyrenées, and the first land sighted was at 2.20 p.m., when the clouds began to break up. Madrid being sighted at 3.10 p.m., and we landed at Cuetro Vientos Aerodrome at 3.28 p.m., having completed the journey in 7¾ hours."

Beating the Cable.

When the Napier-engined Alliance machine recently made the magnificent flight from London to Madrid in seven and three-quarter hours a cable message was dispatched from Madrid to Napier, Ltd., to announce the successful finish of the flight. This cablegram was not delivered until 15½ hours after its dispatch, exactly twice the time occupied by flying the distance. When one thinks of the amount of mail that might have been carried, it is obvious that aeroplanes will be serious rivals to the cable companies.

An Official Record.

It has been notified to D. Napier and Sons, Ltd., by the Royal Aero Club that the speed attained by Captain Gathergood when he won the Aerial Derby with a Napier-engined Airco machine on July 21st has been accepted as a British "record" for a closed circuit. The speed on that occasion was 129.3 miles an hour.

Offered to the Nation.

Vickers, Ltd., have stated that they are willing to present to the nation the Vickers-Vimy-Rolls aeroplane in which Capt. Sir John Alcock and Lieut. Sir Arthur Whitten Brown accomplished the Transatlantic flight.

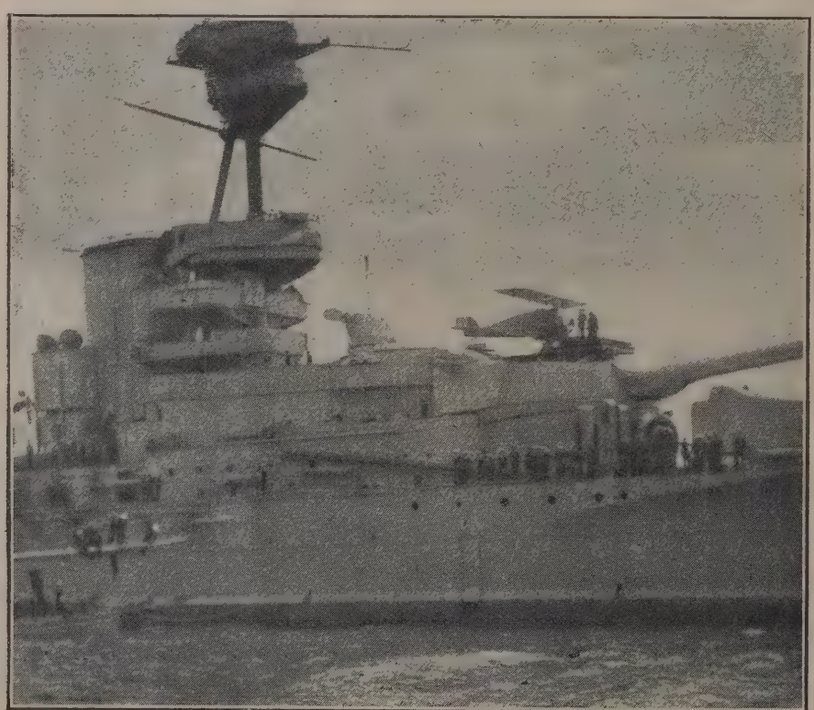
General Seely, Under Secretary for Air, replying to a Parliamentary question the other day, said he was asking the First Commissioner of Works, if, in the event of the aeroplane being offered to the nation, he could exhibit it in South Kensington or another museum.

Alleged Bigamy.

Archibald Gill, a demobilised R.A.F. officer, was committed for trial on bail at Braintree on Aug. 22nd on a charge of bigamy.

Maud Wells stated that she married Gill in June, 1918. He was demobilised in January of this year. In February of this year she found in his pocket an affectionate letter from another woman.

Twelve days later, it was alleged, Gill married an officer's widow named Jackson, and had booked two passages to South Africa when arrested for leaving his previous wife chargeable to Braintree parish—an offence for which he has just completed six weeks' hard labour.



The Flying Dutchmen.

A writer in the "Evening News" says :—

"The enthusiasm of the Dutch for flying has its humours and its limitations. The people are what one flying officer calls 'load-testers'—the average weight per passenger, women included, has been about 13 stone during the exhibition. The limit was reached when seven men of the super-weight variety took their seats in a Blackburn machine. The pilot in an English aerodrome would have had no difficulty in getting off with this burden, but in Holland, where the ground generally is bad for both landing and starting, the machine gave up the ghost after making two attempts to lift."

The W.R.A.F. Clothing Inquiry.

Miss O'Sullivan, ex-Clothing Controller of the W.R.A.F., who made serious allegations regarding certain clothing contracts which have been the subject of an inquiry, has been demobilised. Miss O'Sullivan has stated that after the inquiry had been proceeding for 12 days, and before it was concluded, she was informed by the Commandant that she had been demobilised, although she had signed on for a further term of service.

A Parnell "Panther" Biplane (230 h.p. B.R.2) on a turret of H.M.S. "Revenge" with the launching platform folded up. The framework on the 15-in. guns to take the platform is shown in the print.

A Roof Aerodrome.

A Board of Trade Committee is considering a scheme for the establishment of a central clearing-house for London's goods traffic. It is proposed that the site of the clearing-house should be in Clerkenwell, and that the roof of the great building should be used as a commercial aerodrome.

Foolish Questions.

The pilots of the Avro seaplanes who are taking passengers for joy flights over Lake Windermere are sometimes asked curious questions. One woman passenger asked if the floats were intended to carry water ballast.

The London Flying Club.

The London Flying Club was opened at Hendon on Saturday, August 23rd. Among those present at the opening ceremony were H.H. the Princess Hatzfeldt, Cdr. Philip de Crespigny, Mr. Beal Davis, Mr. and Mrs. McCreesy, and Mr. and Mrs. Claude Grahame-White. A Hawaiian Band has been brought over from America for the use of this club.

Some Athletic Sports.

The Social and Athletic Club of Short Bros., Limited, held their annual athletic sports on August 23rd at Rochester. There were four open events under A.A.A. laws, as follows :—100 yards flat handicap, 880 yards flat handicap, one mile flat handicap, and a women's 80 yards handicap.

The WORLD of AERONAUTICS (continued)

A Corporal's Capture.

At Croydon Police Court on Aug. 23rd, Edward Henry O'Brien, 26, who described himself as a horse-breaker, of Peabody Buildings, Stamford Street, Blackfriars, was charged with being concerned with two other men not in custody in stealing from Kenley Aerodrome a Crossley motor-car valued at £1,200.

Corporal C. H. Greagsby, R.A.F., said that on Friday, about mid-day, when passing the front of a garage, he noticed the prisoner drive the car away. He took a note of the number, not being certain whether it was a car belonging to the Air Force or not. On ascertaining at the office that it belonged to the Air Force, he got another car and went in pursuit. He did not overtake the prisoner till near Purley, and then noticed that he had two other men with him in the car. The witness picked up an Automobile Association scout at Purley, and drove into Croydon, where he obtained the assistance of a policeman. They then continued till the main road became narrow near Friends Road, where a tramcar was about to stop. The witness then thought that by getting his car between the Crossley car and the tramcar that he could block the prisoner in, and did so, pulling up at an angle in front of the other car. The prisoner and his two companions jumped out and disappeared up Friends Road.

It was also stated that on leaving the car two of the men got away over a wall. The prisoner was followed by a crowd of people, and after an exciting chase he was captured.

The prisoner was remanded for a week.

A Sound Argument.

The following letter appeared in the "Times" of August 19th:—

Sir,—I see that the "Times" has discovered another Slough at Dorchester. Had the "Times" confined its criticism to the policy of continuing work after the Armistice, that criticism might have been justified. As it is, one can only be distressed at the hasty conclusions it seems to have jumped at. Perhaps I can enlighten you on some points.

The airship service expanded enormously at the end of 1917, chiefly owing to the adoption of "mooring-out" stations, which system was first thought out by the C.O. of Mullion Airship Station. These mooring-out stations consisted of a landing ground and a wood, in which the airships were housed. These moored-out airships had to return every few weeks to the parent station for overhaul. Now, Mullion was the parent station of Toller (Bridport), Laira (Plymouth), and Bude. Eastbourne was the parent station of Slindon (Chichester) and Upton (Poole). I was C.O. of Toller, and a friend of mine was in command at Upton. We both found it very difficult to keep in touch with our parent station, and an intermediate station was advisable. The approach to Southampton and the suitability of Lyme Bay for submarine-resting made Toller and Upton indispensable at the time, but Dorchester would have absorbed both.

This is one of the many justifications for Dorchester.

Let us turn to your Special Correspondent's criticisms. They may be headed:—(1) Ground; (2) sand; (3) a pit; (4) a well; (5) what he calls "wings," apparently wind screens. These points can be easily dismissed.

(1) Can anyone find 400 acres of land midway between Eastbourne and Mullion, near a railway and near fairly good roads, uncultivated?

(2) Sand could have been obtained by quarrying. Would the contractor have brought sand from the Midlands, if he could have obtained it cheaper on the spot? Surely the labour question must enter into the arrangement. It is probably cheaper to buy sand than quarry it.

(3) Perhaps your correspondent would have liked the gas plant to have been in the pit. As these plants cost a quarter of a million, perhaps it is better "with its sides falling in."

(4) A well is surely necessary.

(5) Wind screens can be easily dismantled and the corrugated iron used for roofing. As for there being little work done by November, 1918, I believe you will find that the station was to have been opened in February, 1919, so that the work must have been well advanced by the end of 1918.

I may add that I hold no brief for the R.A.F. or anyone else, having been demobilised last March.—Yours faithfully,—H. Vivian Terry, late C.O., Toller R.N. Airship Station. Goldhanger, Witham, Essex, Aug. 15th.

[Moreover, as Lord Lytton stated in the House of Lords on Aug. 18th, it was not a fact that the war ended at the Armistice. Even now the Peace Treaty is still unratified by certain belligerent nations, and the Government had at least to be ready for a renewal of hostilities up to the signing of Peace in June.—Ed.]

A Miracle of Ignorance.

"The Freeman's Journal," in an article on the use of helium, says: "Hydrogen is highly inflammable, and few airships have escaped being burnt in consequence." The writer might just as truthfully say that petrol is so inflammable that few motor-cars escape being burnt. Thus do non-technical journals display to us the vast ocean of their ignorance.

The Arrest of Alleged Smugglers.

The London newspapers gave much prominence last week to a report that there had been an alleged attempt to smuggle 20,000,000 marks and securities from Germany to Switzerland. The German "Tageblatt" hints that the owner of the money is a lady who formerly occupied a very prominent position in Germany, and recently thought of going to live in Switzerland with her children. The twenty million marks represent only a part of her very considerable fortune. The securities were entrusted to a Swiss family who have been staying here for a long time, and two members of the family undertook to convey the valuables under the supervision of a gentleman "well known to the public."

The money was taken from persons who travelled by the Berlin-Bale express, and they were chased by three aeroplanes. One of them carrying a high official of the Berlin police, developed engine trouble over Magdeburg, but the official entered another aeroplane, and resumed his journey to Nuremberg, where the arrest took place.

Scandals and Glory.

A correspondent of the Edinburgh "Evening News" who has written about the recent "scandals" thinks it necessary to defend the R.A.F. Thus:—

"Apparently the public are going to hear a great deal more about the seamy side of things aerial than of the countless feats of heroism in the period 1914-18. It will be well for people to believe the best of the Force—which developed latterly into a great army, and included all sorts and conditions of men and women—and to understand what a tremendous weapon was forged under difficult conditions. That such a large Force carried 'passengers' was undoubted; but so did the Navy and the Army. There was waste, of course. Everyone who went from aerodrome to aerodrome must have noticed the profusion which inevitably accompanies war; but there were economies also. The personnel of the Force know all about that. Cox did not present them with a sheaf of blank cheques. But there was no economy in one respect—bravery."

The writer states the obvious rather prettily.

168 Miles per Hour.

It is announced by the Director of Air Service, Washington, that Lieut.-Col. H. B. Clagett, with Serjt. Ralph Kratz as passenger, made a flight in a De Havilland machine (make of engine not stated), from the Capitol at Washington to the Statue of Liberty in New York, 210 miles, in 75 minutes, which is at the rate of 168 miles per hour. It is claimed that this establishes a new record. The previous fast records were made in 84 minutes. Lieut.-Col. Clagett flew at an elevation of 4,000 ft.

Another Altitude Record Claimed.

Lieutenant Weiss, accompanied by his mechanic Beque, on August 13th, attained a height of over 9,000 metres (about 29,500 ft.).

The machine, a Bréguet 300-h.p. Renault, fitted with a Rateau super-charger, ascended from the Villacoublay Aerodrome at 6.30 p.m., and made a good landing at 8.10 p.m., the actual climb only taking 52 min. The pilot, who was forced to descend on account of the darkness, declared that he encountered a temperature of 32 deg. (centrigrade) below zero (equals 25.6 deg. below zero Fahrenheit). The exact official altitude reached will not be known until later. The pilot stated that he could have ascended much higher, but owing to the lateness of the hour he was afraid that he would not be able to land before dark.

A Use for Unserviceable Machines.

The U.S. Air Service has decided to offer a large number of unserviceable engines and aeroplanes to American colleges and schools that undertake to teach aeronautical engineering. This appears to be an excellent method of disposing of machines that would otherwise be reduced to produce.

COMING EVENTS.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

The article on "Aerial Propulsion" by Capt. W. H. Sayers is concluded in this issue.

In it Capt. Sayers points out some of the practical difficulties which have so far prevented the development of the internal combustion turbines, and makes the suggestion that the possibility of direct jet propulsion for aeroplanes is worth investigation.

Under the head of "Modern British Aeroplanes" some of the recent work of the firm of Martinsyde, Ltd., is described.

Mr. T. S. Harvey contributes further notes upon the Italian Aero Show at Taliedo.

An extensive abstract of the report issued by the American authorities, describing the special plant laid down at the Bureau of Standards for testing aero-engines under conditions similar to those which occur at high altitudes, is commenced in this issue.

AERIAL PROPULSION—II.

By CAPT. W. H. SAYERS (LATE R.A.F.).

The internal combustion turbine has attracted the attention of many engineers. A turbine driven directly by the products of combustion of gas or a liquid fuel, burnt under pressure and acting directly upon the blades of the turbine wheel, offers a prospect of great advances in the efficient use of fuel and of a great saving in the bulk and weight of power plant.

Unfortunately the difficulties of producing such a prime mover are very considerable, and have so far proved insuperable.

The elementary idea of providing a burner jet, somewhat after the style of a blow-lamp, and directing the flame upon the turbine blades, is obviously impracticable. There is no known material of which blades could be made which would stand the temperature or the erosive action of the hot gas.

Numerous ingenious attempts have been made to overcome this difficulty. Generally these have consisted in the provision of some form of separate combustion chamber to which gas, or oil, and air are introduced under pressure and there burnt. The products of combustion are then allowed to expand through some form of nozzle, gaining velocity and losing temperature therein before reaching the turbine blade. In many cases the gases have been diluted with cool air by the use of a kind of air injector, with the effect of increasing the total volume of gas and of reducing both its velocity and its temperature before reaching the turbine.

In one case the nozzle wherein the gases expanded was water-jacketed, and water from this jacket was injected into the gas stream. In this manner a working fluid was produced, consisting largely of super-heated steam, at a temperature, however, well below that of the products of combustion.

By thus diluting the products of combustion the difficulties of manufacturing the turbine itself have been fairly satisfactorily overcome, only to reappear in the combustion chamber, however.

The condition of being subject continuously to a very high temperature and pressure has proved too arduous for any known refractory material.

The cylinder walls and piston of a reciprocating engine are in contact with burning gases of equally high temperature and pressure, but only for a small fraction of the total working cycle, and they never themselves assume the temperature of combustion. Even so, elaborate methods of dissipating the heat which is imparted to them are necessary.

MIXED GAS AND STEAM TYPES.

Water-cooling of the combustion chamber has been attempted, but this involves a large waste of heat energy, partly recoverable by turning the cooling water into steam and mixing that steam with the burnt gas, but only at the cost of converting the plant into a steam turbine plant.

For aircraft purposes this is objectionable, because either condensers must be installed or a large supply of water must be carried and consumed over and above the fuel required.

Thus the internal combustion turbine, although a promising field for experimental research work, cannot be considered as likely to come into use as an aerial power plant for some years.

The consideration of the whole question of aerial propulsion suggests, however, one field for experiment which has not yet been explored.

In any form of internal combustion engine, reciprocating or turbine, the first step in the cycle of energy transformation is, as has already been pointed out, to impart motion to a volume of gas.

The final step in the cycle of energy transformations which occurs in the propulsive plant of any aircraft is also the setting in motion of a volume of gas.

Cannot the whole cycle be immensely simplified by imparting directly to a column of air the motion which is produced in the products of combustion by the heat of combustion?

The idea of direct jet propulsion is, of course, old.

Steam jet propulsion for ships was suggested certainly in the first half of the nineteenth century, but was not and cannot be satisfactory.

The efficient conversion of the energy of a gas at a high temperature and pressure into the kinetic energy of a jet of the same gas at atmospheric temperature and pressure involves a very high velocity on the part of the jet.

In the case of steam at 100 lb. per sq. in., for reasonable efficiency in such a conversion, the speed at which the steam must emerge from the nozzle is of the order of 1,000 ft. per sec.

The use of such a jet as a propeller is equivalent to the use of an airscrew giving a slipstream velocity of 1,000 ft. per sec., and would need a speed of propulsion of the aeroplane or other craft to which it was attached of 500 ft. per sec.—over 300 miles per hour—to attain a propeller efficiency of 50 per cent.

The extreme speed of ships may be put at 40 m.p.h., or about 60 ft. per sec., and under these conditions the efficiency of ship propulsion by a jet of gas at 1,000 ft. per sec. could not exceed 6 per cent. on the jet alone. As a steam engine and a marine propeller can certainly give 10 per cent. overall efficiency, reckoned from the initial calorific value of the coal, the jet method has little value in this case.

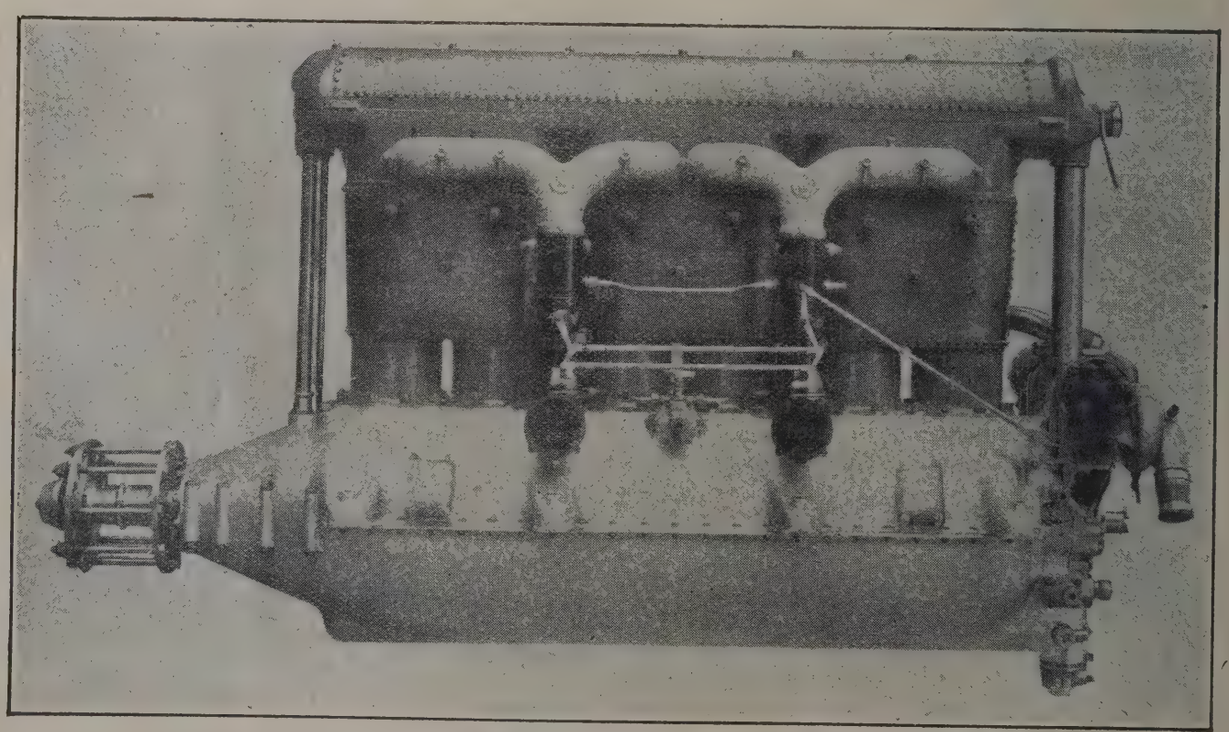
The speed of modern aeroplanes has reached 160 m.p.h. —nearly 250 ft. per sec.—and the efficiency of a steam jet propeller might accordingly reach something round 25 per cent.

This, of course, is simply the jet efficiency—in fact, it is not even that, since there are friction losses in the passage of the steam through the nozzle. Over and above this loss there are losses in the conversion of water to steam in the boiler and in the process of turning the pressure energy of the steam into kinetic energy of the jet, and the overall efficiency would certainly not equal that at present reached by the combination of internal combustion engine and airscrew.

In addition, the use of steam involves carrying large weights of water in this case as in others, and that rules it out of serious consideration.

At the same time it might be well worth while to experiment with a gas jet propeller. This would presumably be something of the nature of a gigantic blow-lamp, in which gas or vaporised oil and air would be mixed and burnt in an expanding nozzle. The velocity of the issuing jet of gas would, as in the case of a steam jet, be too high for efficient direct propulsion, and dilution by air, by using the original products of combustion in an air injector, thus increasing the volume of gas set in motion and reducing its velocity, will certainly be found necessary.

Any such method of dilution, whilst improving the propulsive efficiency of the final jet, will inevitably be accompanied by a loss in thermal efficiency of the system measured as the ratio of the original heat energy in the fuel to the total kinetic energy finally imparted to the moving stream of air.



It will not necessarily be accompanied by a loss in the efficiency referred to the final useful energy imparted to the aeroplane.

It may also be pointed out that such a propelling plant offers prospects of being extremely cheap to construct and very light in weight, and that these two factors would compensate for a low overall efficiency and a fuel consumption appreciably greater than could be obtained by the present methods.

If, as seems possible, the speed of aircraft is greatly increased, the problem of direct jet propulsion will be correspondingly simplified, and the idea seems to merit detailed investigation.

Of course, for war purposes, a blow-lamp-propelled machine which had only to put its enemies into its own backwash to utterly destroy them would have uses which might justify the immediate adoption of the method.

Hostile airships, even helium-filled, would dislike such an aeroplane intensely, and night-flying demonstrations by such machines directed against barbarous races might produce an immense effect.

The 200 h.p. 6-cylinder Isotta-Fraschini Aero Engine. The cleanliness of outline is a notable feature.

WESTLAND

The Westland "LIMOUSINE"

with the "Rolls-Royce" engine. This is not a converted war machine, but has been designed and built for high-class public passenger service or for the convenience of the private owner.

It combines the speed of an aeroplane with the comfort of a Limousine.

For full particulars and arrangements as to trial flights apply to our London Representative **Lieut.-Colonel C. H. MEARES,** HOTEL REGINA, 17, SOUTHWELL GARDENS, LONDON, S.W.7.

MODERN BRITISH AEROPLANES.

XII.—Martinsyde, Ltd.

The Martinsyde F4 type fighter (300-h.p. Hispano-Suiza engine), one of the finest single-seaters ever produced.

The history of the Martinsyde firm dates back to the earliest days of British aviation, Messrs. Martin and Handasyde conjointly producing a monoplane as far back as 1908. The big "Martinsyde" monoplanes of 1911, 1912 and 1913, built at Brooklands, were noted for their graceful appearance and their wonderful flying.

Early in 1914 the firm built, for the late Gustav Hamel, an enormous monoplane upon which the Atlantic flight was to be attempted. This machine was to be powered by a "Sunbeam" engine of 250 h.p. and had tanks sufficient for a ton of petrol. The death of Hamel prevented the attempt from being made and the machine was never flown.

Towards the end of 1914 the firm produced their first biplane, a single-seat fighter with an 80 "Gnôme" engine, which was very successful and was ordered in quantity by the War Office.

A later "Martinsyde," fitted first with the 120-h.p. Beardmore engine, and later with the 160-h.p. engine of the same make, was equally successful, and the firm had to move from Brooklands to large works near Woking in order to meet the demands of the R.F.C.

Of their more recent products the types F3 and F4 are world famous as fighting aircraft.

THE MARTINSYDE TYPES F3 AND F4.

The F3 single-seat scout was designed and built in 1917. Fitted with a Rolls-Royce "Falcon" engine of 250 h.p. it had easily the best all-round performance of any aeroplane till then produced. It had a top speed of over 140 m.p.h. and was, it is believed, the first machine in the world to climb to 15,000 ft. in less than 15 mins. with full war load on board.

Unfortunately, Rolls-Royce "Falcon" engines were scarce and could not be spared for this type, and after some delay the machine was modified for the 300-h.p. Hispano-Suiza engine and was put into production as the F4, but did not reach any theatre of war before the conclusion of the Armistice.

These machines were of the usual single bay "scout" type, with lower wings staggered well back, and a deep fuselage, wherein the pilot is seated behind the trailing edge of the upper wing, sufficiently high to see both above and below that wing.

He has thus an exceilent all-round view. The armament fitted was standard, twin synchronised Vickers guns within the cowling firing through the propeller, and in conjunction with the extreme handiness of the machine and its very fine performance, would have rendered it a formidable antagonist.

The attached specification gives all the main characteristics of these machines, and their general appearance is well shown in the illustrations :—

SPECIFICATION.

Type of machine	Biplane
Name or type No. of machine	F4.
Purpose for which intended	Fighter
Span	Top plane, 32 ft. 9⅜ in.; bottom, 31 ft. 2⅜ in.
Gap, maximum and minimum	5 ft. 2⅜ in.
Overall length	25 ft. 5⅝ in
Maximum height	10 ft. 4 in.
Chord	Top plane, 6 ft 0½ in.; bottom plane, 5 ft. 6¼ in.
Total surface of wings	320 sq. ft. (all in).
Span of tail	11 ft. 1½ in. (over elevators).
Total area of tail	36¾ sq. ft. (tailplane and elevators).
Area of elevators	8¼ sq. ft. each (Total 16½ sq. ft.).
Area of rudder	9¾ sq. ft.
Area of fin	6½ sq. ft.
Area of each aileron and total area	Top, 11⅜ sq. ft. each; bottom, 9¼ sq. ft. each (Total 42 sq. ft.).
Engine type and h.p.	Hispano-Suiza, 300 h.p.
Airscrew, diameter and pitch and revs.	Dia., 8 ft. 8⅞ in.; Pitch, 6 ft. 6 in.; Revs., 1850 r.p.m.
Weight of machine empty	1710 lb.
Load per sq. ft.	7 lb.
Weight per h.p.	7½ lb.
Tank capacity in hours	3 hours.
Tank capacity in gallons	43 gallons
Performance—	
Speed low down	145 m.p.h.
Speed at 10,000 ft	143 m.p.h.
Speed at 20,000 ft.	126 m.p.h.
Landing speed	45 m.p.h.
Climb—	
To 5,000 ft.	3 mins.
To 10,000 ft.	6.30 mins.
To 20,000 ft.	19.30 mins.
Total weight of machine loaded	2,280 lb.

THE MARTINSYDE, TYPE A.

Since the conclusion of hostilities Martinsyde, Ltd., have turned their attention to the production of load-carrying machines for commercial purposes.

The "Raymor" built for Mr. Raynham's attempt at the Transatlantic crossing was a modified edition of the first of these types, the modification consisting of fitting fuel tanks up to the limit of the machine's carrying capacity.

As a commercial machine with 7 hours' fuel capacity, there is a large reserve of disposable load available for cargo or passengers.

A number of illustrations of the actual Transatlantic machine have appeared in past issues of The Aeroplane and no others are at present available.

The general particulars of the Type A, as this machine is to be called, are given below :—

SPECIFICATION.

Type of machine	"A."
Name or type No. of machine	Transatlantic (Modified).
Purpose for which intended	Commercial.
Span	43 ft. 4 in.
Gap, maximum and minimum	5 ft. 6 in.
Overall length	27 ft. 6 in.
Maximum height	11 ft. 0 in. (on prop).
Chord	6 ft. 6 in.
Total surface of wings	500 sq. ft.
Span of tail	12 ft. 4 in (over elevators).
Total area of tail	44 sq. ft.
Area of elevators	9.3 each (Total, 18.6).
Area of rudder	10 sq. ft.

PERFORMANCE—
Speed low down .....125 m.p.h.
Speed at 10,000 ft. .....118 m.
Landing speed .....45 m.p.h.

Climb—
To 5,000 ft. .....8 mins.
To 10,000 ft. .....18 mins.
Disposable load apart from fuel .....2,000 lb.
Total weight of machine loaded .....4,600 lb.

AT THE TALIEDO SHOW AGAIN.

As I had expected, a good many more things had turned up by the time my second visit to the Show took place—i.e., towards the end of the ten weeks the exhibition was open. Among these mercifully was the Official Catalogue, a conveniently shaped pocketable work of 80 pages without adverts.

Then, too, the enemy trophies had got sorted out and their propellers, descriptions, and engines had assumed their correct places. Also another machine had arrived, so that the number slipped—just—into double figures.

The "thing of enormous span labelled Gotha" had turned into a torpedo-carrier seaplane, with Benz 400 motors, weight 3,182 kilos, useful load 1,616 ditto, with oil, petrol, crew, and armament. This latter was apparently at least one gun, as the forward gun ring base was all there. The craft has a boat-body, "does 130 kilometres per hour at low levels, and climbs to 1,000 metres in 16 minutes."

The motors, however, were not visible, and the machine was quite unreconstructible.

A moderate-sized flying-boat with motor very high on massive engine platform, wing floats, and radiator forming centre section of upper wing, evidently a relation of the Löhner family, is the last addition to the war trophy shed and the least interesting feature of it.

On the huge K.338 I now noted a four-bladed tractor driven direct by the Austro-Daimler V 350 motor. Also the wing struts appeared to be adjustable.

A further careful examination of the Caproni up-to-date section—there is also an educational or historical section in a different shed—revealed the fact that the whole of the monomotor triplane chassis is rubber-sprung to the fuselage, not the axle to the under-carriage struts or to its bearers, as is more usual. I read, too, that the wheels were to be set farther apart and more forward to parry any attempt at nose-planting on the machine's part when landing. The cables are enormous, themselves alone telling of the weight and speed for which the machine was designed, and the third and fourth interplane struts are integral with the sides of the fuselage. A four-bladed prop. is fitted, and rumour has it that the machine is not at all likely to stay on the shelf now that motors are easier to obtain.

A model of a proposed 2,000 h.p. five-motored triplane, a mere development of the 1,200 h.p. triplane, also came under my notice. The two extra engines, with their airscrews, are placed in false fuselages under the middle plane. At the end of the two real fuselages beneath the tail and extending downwards from it to the very root of the tail skids—which, it will be remembered, are supported on tall inverted "cabanes" or pyramidal structures consisting of kingposts and steel tubing—are two vertical fins of generous proportions. So evidently these big three-deck machines have been found to require more side surface lower down. Vide my second Show description in No. 4 of this volume of THE AEROPLANE. Sixteen wheels are fitted, the hind eight being of larger diameter.

While dealing with models, the exquisitely finished things shown by the Experimental Aeronautical Department (the Italian N.P.L.) should not be passed by. The admirable eel-like body of the Marchetti-Vickers biplane, quite unappreciated by the camera, is unapproached for elegance by anything since the Antoinette deceased. Can the world's speed record which this machine, with a comparatively small engine, SPA 220 h.p., did undoubtedly put up, be attributed to this unusual section? If so, what becomes of the blunt entry and streamline theory?

A full equipment of instruments for measuring everything in sky and land and air, most of them invented by Col. Crocco, are exhibited by the Institute, as also models of the V. dirigible experimented with in '14, which show how the latter-day Zepps. were copied from her internal construction and shape. The full-size power egg of a V. complete can be compared with one from a 1918 German dirigible brought down by the aid of an Italian battery on the French front. The German has two Maybach six-cyl. motors, and of course cannot be compared with the pre-war finish of the V. egg, which is radiant in an aluminium shell. Three of these eggs, with two engines clutched to a single four-bladed propeller, formed the power plant of the V., which type was not proceeded with after the outbreak of war.

The other side of the alley is to be seen a model of a revolutionary dirigible-hydro aeroplane, with eight screws and a hollow open-ended cylinder body, which hopes to capture stability by its cutting effect and the imprisonment of air. The designer—one Signor Cittadini—has other plans, all showing want of adherence to the beaten tracks of aeronautical theory.

Though somewhat unrecognised because turning out CA parts and necessary machinery, the Officine Meccaniche of Brescia and Milan did, and seem likely to continue to do, a lot of useful work. On their stand, which is guarded by aeroplane struts and chains of coil springs in a sensible, pleasing, and probably cheaper way than by the eternal ropes and posts, they show the CA fuselage complete with I-F motor fitted to the 600's, and a lot of big blocks of metal in their various stages from the rough to the finished crankshafts and axles. Also a two-storied propeller shaper smaller than the diameter of the propeller in process of shaping thereon.

Among the many motors showing, the I-F is that most in evidence because, as well as on the company's own grand stand, so many of the other firms exhibit their improved licensed repro

A modern Italian single-seater—built by the firm of Gio. Ansaldo and Co.

To "Aeroplane" Subscribers.

Since the Armistice, the subscription list of the AEROPLANE has steadily increased: an eminently satisfactory development which we are anxious to encourage.

Of the many books published on the war on the Western front, none conveys a more realistic impression of the work of a particular arm than FLYING COLOURS by Captain H. M. S. Saundby, M.C., A.F.C., R.A.F., published at **£2 2s.** net (Edition de luxe) and **15/-** net (Popular Edition).

Among the art books published in the last year or two, none can claim to be a more faithful reproduction of the artist's colour scheme and that indefinable thing, atmosphere.

FLYING COLOURS is a permanent memorial of the life of "the pilot in action," as Major-General C. B. Ashmore calls him. It was very costly to produce, and necessarily the price to the public had to be high.

Many would like to possess it who do not feel disposed to put down Two Guineas for the larger edition or Fifteen Shillings for the smaller.

How to meet their views? We make a special offer to any subscriber for one year to the AEROPLANE: namely to give him the right to purchase either edition at half price.

All he need do is to send us the accompanying order form with cheque for one year's subscription, plus **£1 1s.** or **7s. 6d.** according to the Edition he wishes to have.

In order to be fair to current yearly subscribers we extend the half-price concession to them also. If a subscriber has paid a quarterly or half-yearly subscription, then to secure the right to participate he should send the balance for the year.

Subscribers who have given their orders through the trade, and not direct to the AEROPLANE Office, must sign the form below or a copy thereof, and hand it with the balance on account of the book to their retailer for transmission to the AEROPLANE.

If the subscriber already has a copy of FLYING COLOURS, and would wish to take advantage of this offer, then he may secure McCudden's "Five Years in the R.F.C." **(7s. 6d.)**; Richthofen's "Red Air Fighter" **(3s. 6d.)**, and Gill's "The Aerial Arm" **(6s. 6d.)** at half price, *i.e.* **8s. 9d.** the three, plus the year's subscription to the AEROPLANE.

ORDER FORM.

To THE "AEROPLANE,"
61, Carey Street, W.C.2.

Please send me the "AEROPLANE" or one year post free **(30/- inland; 35/- abroad** and one copy of the { Edition de luxe / Popular Edition } of FLYING COLOURS at half price { **£1 1s. 0d.** / **7s. 6d.** } for which I enclose remittance value **£ s. d.**

ductions of it. For example, I noted a good effort to avoid nuts and bolts on the E. Breda Co.'s edition of the vertical engine.

The I-F, having motored so many of the useful MAS—marine accomplices of Italy's undersea-boat-chasing aircraft—that the inclusion of their seven yards long cum 64-valved motor-boat engine is allowable and even apposite in a post-war Aero Show such as this. It and the new 450 (V.7) aero-engine are the salient features of the stand The latter is a V. 12-cyl. W.C. motor with four magnetos and two plugs per cylinder. It appears as a clean-looking affair with the merit of having the inside of the V very clear of obstructions and accessible, but seems rather large for advertised power, than which probably it gives considerably more.

Untested and somewhat unknown is the promising Romeo 600 12-cyl. W.C. V. of that factory's production. The very wide open V produces a low, sturdy, and unusually powerful-looking engine. Its cylinders are in couples, and the valves lie almost horizontal in the head thereof. Two mags. with two plugs per cyl. and very neat wiring see to the necessary sparks. The two duplex Feroldi carbs. at opposite ends of the engine and the vertical exhaust pipes allow of ideal freedom of access to the 36 plugs, spark and compression.

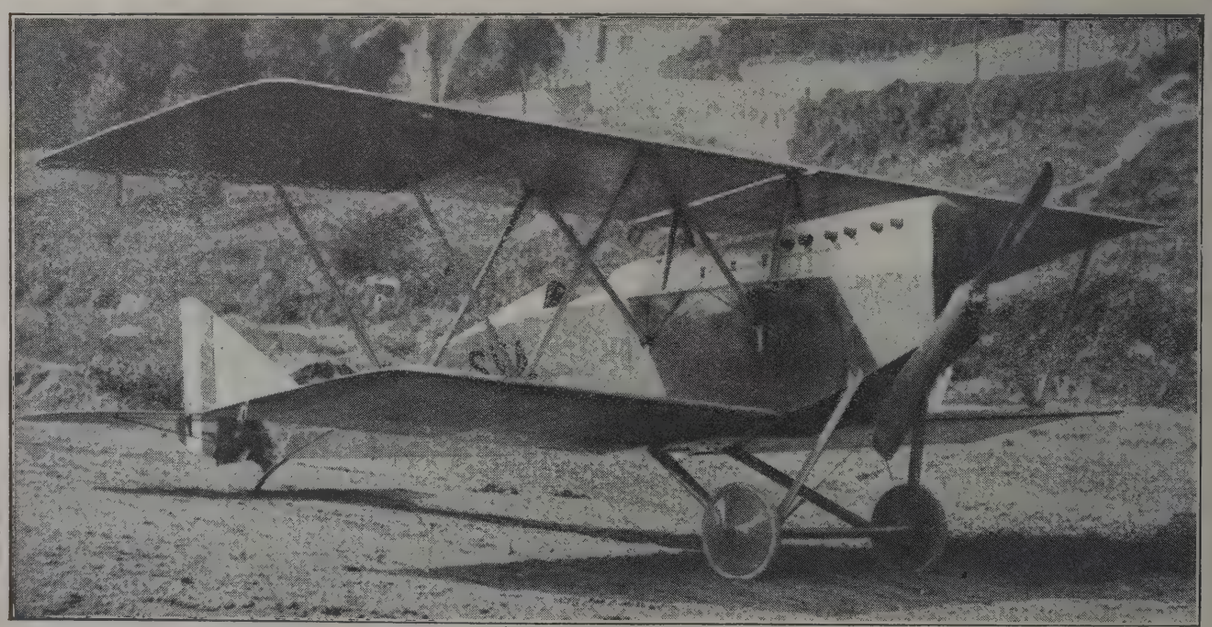
Among the less-famed power producers there were several interesting efforts which, if they have not been more generally adopted, is due more to the general excellence of Italian motors than to their own shortcomings.

I examined particularly a vertical Diatto-built Bugatti eight-cyl. 120 by 160 stroke "200 h.p.," weighing 300 kilogrammes, with propeller offset to the left on a secondary shaft all its own, enclosed in the crankcase and running at a speed of 1,125 revs. reduced from the normal 1,500 engine revolutions. It makes a very short engine in spite of the eight cylinders, and power output at the propeller should be much higher than the nominal one.

The following extra data concerning the Dolara-Perfetti 300 rotary, mentioned in my preliminary Show report, are of interest. Bore 130, stroke 176 mm., cyl. capacity 21 litres, normal revs. 1,500 per minute. The engine is provided with a toothed plate (circular) for transmitting power to two or more airscrews by shaft drive. This toothed ring is of bigger diameter necessarily than the outside measurement of the engine taken round the cylinders, and, lying transversely to the longitudinal axis of the aeroplane, could drive any number of propeller shafts within its power limit. Quite an opportunity for multiple airscrew experimenters. Enquiries may be addressed: Dolara, Corso Magenta 78, Milan.

Still another of the less-famed class is the V.N.V., an anonymous company at Stand 25, the designers of whose motors are the engineers Vanni and Trivelloni. They exhibit a large two-stroke weighing 280 kilos. and developing from "200 to 300 h.p." with opposed pistons. Also a Y water-cooled 260, weight 270, cylinders three. This looks a clean job and makes a most get-at-able engine apart from its other possibilities. The firm has three millions of lire of capital, and with its evidently original initiative has the wherewithal to go far. Address is: Via Montevideo 21, at Milan.

Carlo Tosi, the great Legnano firm, has amid a lot of admirable but irrelevant machinery an aero motor and a Matteucci epicyclic reduction gear shown for various uses and also fitted to a propeller hub. I shall hope to say more of it when the Military Technical Direction take it up or vice versâ. One is encouraged by these straws to hope that Tosi is not going to keep aloof from aviation as we have been told.



"Itala Motors," who went through the war copying H-Suizas for the Aero Corps and Maybachs for the Dirigible Section—as it used to be called—show one of these which came through the 50-hour bench test with flying colours, though stationary. It is completely dismounted and seems little the worse for the wear-and-tear test. This seems the time and place to deny that that little tale which Dora downed refers to the Itala. The story ran that a firm copying a Hun engine could never be got to waste time over the, to them, unnecessary degree of finish to the connecting rods till the authorities enquired officially why the copies used 1-5th pint more oil per—I don't remember what—than the original.

The SPA, who in their quiet, untrumpeted way were the first firm to engine an Italian aeroplane, and are now doing likewise to the SVA and other good flying machines, show motors of all sorts, from the opposed twin built about 1910 for Ing. Faccioli which flew so well, through a train of wholely original, specially designed aero engines, to its latest vertical power plant for the war. This latter about the least original of the lot owing to the exigencies of hostilities. It is a slight balm to one's regret at not seeing a Faccioli biplane in the historic section to find photos and reminiscences of that designer's machines on the SPA stand. In the words of a contemporary, "Il Cielo" (a pilot's paper): "Faccioli solved the problem of practical longitudinal stability obtained dynamically and inherent in the design when everyone else was wallowing in complete ignorance of the whole question." The first journal to publish photographs of this, the first Italian machine to fly, was edited by the present editor of THE AEROPLANE.

Now to talk of old friends. It is wonderful to think that for a long time the war was dragged on quite well with '14 Löhners built by Macchi—to order, of course—and by '13 Aviatics turned out by the S.A.M.L. Co., and that these, engined by Fiats, now still carry on and are exhibited in 1919 aero shows. I noted that a looking-glass for the pilot to see if the passengers' looks are worried or gladsome is now fitted on the latest models. These luxuries show real progress.

Among the accessories, if essentials can so be misnamed, there were spring wheels based on an application of the cantilever-cum-helical spring principles as far as one could glean in the absence of literature, stand-attendants and free access to the article. These and spring hubs are the line Messrs. Vimercati and Fiorina are taking up anent aero business, and who can say they may not be on the right track to the dollars.

A carburetter, a Corti invention, cleverly combining throttle with air entry, drew me with strange attraction, these instruments being my weakness. "Opening the throttle" causes two

An SVA. Aeroplane—built by Gio. Ansaldo and Co The machine shown is very similar in general design to the 700 h.p. Rome to London machine, illustrated in a recent issue of THE AEROPLANE, but is a single-seat fighter of smaller power.

VICKERS LIMITED

THE TRANSATLANTIC FLIGHT
"VICKERS - VIMY - ROLLS"

The first direct Flight from Newfoundland to Ireland 1,900 miles was accomplished by this Aeroplane in 57 hrs 57 mins. 4 tons of Petrol and Oil were used.

Aviation Department,
Imperial Court, Basil Street,
KNIGHTSBRIDGE, S.W.3.

Telegraphic Address :
Vickerfyta, Knights, London
Telephone :
Kensington 6520 (4 lines).

rollers situated in the induction pipe (which they entirely close up) to revolve. When the throttle is closed these rollers are in contact along the whole of their length. Extending over two-thirds of their surfaces each has a V-shaped depression increasing from its base in depth, and streamline contoured. When the bases of the two Vs touch the jet is closed, itself serving as a stop for the throttle lever. The rollers are bronze very carefully cut away so that the opening round the jet is always circular. The only thing which could be simpler is the throttle leverage system due to the necessity of compensating the travel of the two rollers.

The F.R.A.M. show their radiators, fitted at one time or other to most moving vehicles in this country, and is such an old and tried firm as to need nothing but a very honourable mention.

Near their wares appeared the name of the Association of the Autolocomotion Industrials, promoted to weld together those interested in modern progress by land and sea and sky, which, if it does not remain merely a name, might become the biggest trade federation in the world.

Chiribiri has indeed fallen from grace, though, perhaps, into land which he may succeed in making to flow with milk and honey, things more esteemed than money nowadays. He only shows a horrifying agricultural tank with tender slung on each wheel—I feel like writing *claw*—which mocks the contortionist, and which, with a suitable prehensible tail, should be quite a good vehicle for birds'-nesting. Each wheel is propped up at a different altitude, and the tender appears to be in the throes of a spiral. The whole thing should be a serious pull-up to the first chronic drunkard who strolls in.

Drying-up and missionary-folk, please note.

A pleasing relief among the accessories is a complete nacelle for one of Usuelli's submarine-finding dirigibles on "Blimp" lines. The firm is located in via Boccacio, No. 14, Milan, is going strong, and is an example of the help a keen amateur may become to his nation in need.

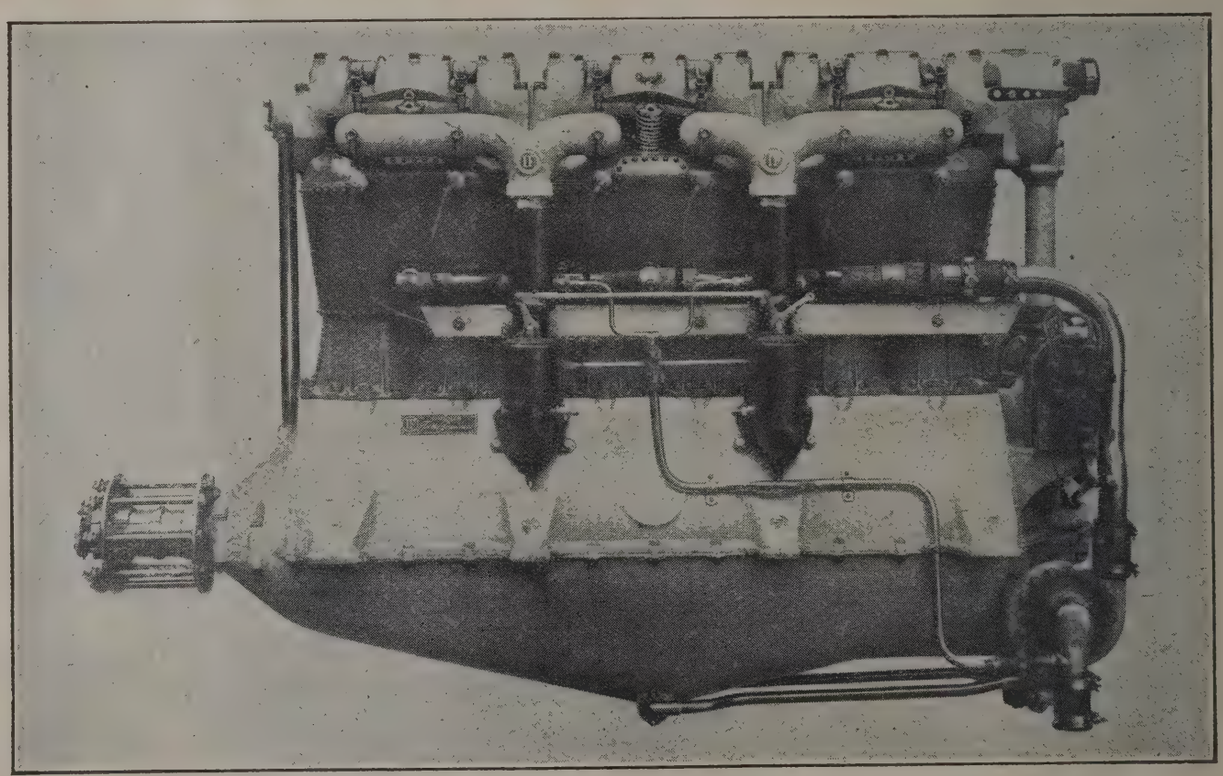
In their own "parc" the dirigible the Prassone-Avorio kite-balloon and the ordinary gasbags show, the well-informed tell me, almost incredible progress. The stillness of the P.A. in stiff winds seems uncanny to the non-expert who may be inclined to wonder whether the cable is rigid! The space in the biggest shed round the dirigible was partitioned off into two corridors filled with stands of accessories and instruments for navigation. The swivelling propellers reminded me of certain small airships of the good old days in early England.

Apparatus for the pneumatic control of the blade pitch and centre of thrust are matters round which the Angels might fear to tread lest they trip, and they are expected to be *au fait* with gravity and lift theory. I noted a built-up hollow aluminium blade and a 16-bladed wooden "lifting screw," evidently both well used. Also instruments for testing the tautness of fabric, and so detecting leakages of that elusive dirigible stuffing known as gas—helium and otherwise. The former is in use here.

Though only a specialist would dare to criticise this part of the show, one is led by it to think how far one's appreciation and respect for the research of the Dirigible Section has fallen short of the mark and that the robbing of her "Ally's" brains by Germany before she built the latter Zeppelins is more than probable.

In spite of the practically total absence of the Southern firms and the non-appearance of even some of the better-known Midland ones, this One-Nation Show is about as wonderful as man could make a Show in the times we live in. Regular passenger-carrying work by dirigible and aeroplane has been carried on to time-table during the whole ten weeks without a single accident.—T. S. HARVEY.

AN ITALIAN SEAPLANE.



Anent Taddeoli's trip over the Alps on a Savoia-S.I.A.I.—S. 13 type seaplane with a Isotta-Fraschini V.6 250 h.p. engine—from Lake Maggiore to Geneva, it is well to remember that Taddeoli, though in the service of Italy, is Swiss, and one of the first to do waterplane flying. The machine is a biplane of 35 sq. metres surface with a chaser type cellule, carries 475 kilos. useful load, climbs to 5,000 metres in 42 minutes, and claims a speed range of from 120 to 200 kilometres per hour. Engine-bearers and struts give the impression of the weight of the power-plant being very well distributed over the whole wing surface. A small sister boat was at the Taliedo Show.—T. S. H.

THE WALKER PROPELLER BORING JIG.

Owing to the time, trouble and expense entailed in preparing a number of different jigs for boring the bosses of numberless experimental propellers produced early in the war, the Faringdon Propeller and Engineering Co., Ltd., introduced the Walker Propeller Boring Jig, which entirely superseded all the old jigs.

The jig consists of two dividing plates, separate ones being provided for various hubs having different numbers of bolt holes, and a moveable boring arm with a fine screw adjustment, which allows the bolt hole circle to vary from 4⅛ in. to 11⅛ in., the position for each hole being determined by a hardened steel spring pin dropping into the holes in the dividing plate. Suitable bushes are supplied to suit the diameters of the centre boss-hole and the bolt respectively.

With this instrument it is possible to bore any number of propellers with the minimum amount of wear; as the whole of the drilling is done through the one hardened steel bush, and it also ensures absolute accuracy with the least amount of labour.

A 200 h.p. 6-cylinder Isotta-Fraschini engine. A somewhat earlier edition of that illustrated on page 810.

AMERICAN ENGINE TESTS UNDER HIGH ALTITUDE CONDITIONS

It is fairly well known that the American National Advisory Committee on Aeronautics had carried out a number of experiments on aero engines under conditions which simulate those found at high altitudes in flight.

The majority of these tests were made at the special "Altitude Laboratory," erected for that purpose at the Bureau of Standards —the American equivalent of the British N.P.L.—and an official description of the Laboratory, and of the results of some of the tests made therein, is now available for publication.

The complete reports, as issued, are too lengthy for publication *in extenso*, but the following abstract will serve to give a general idea of the methods employed and of some of the results obtained.

Official Description of the Altitude Laboratory.

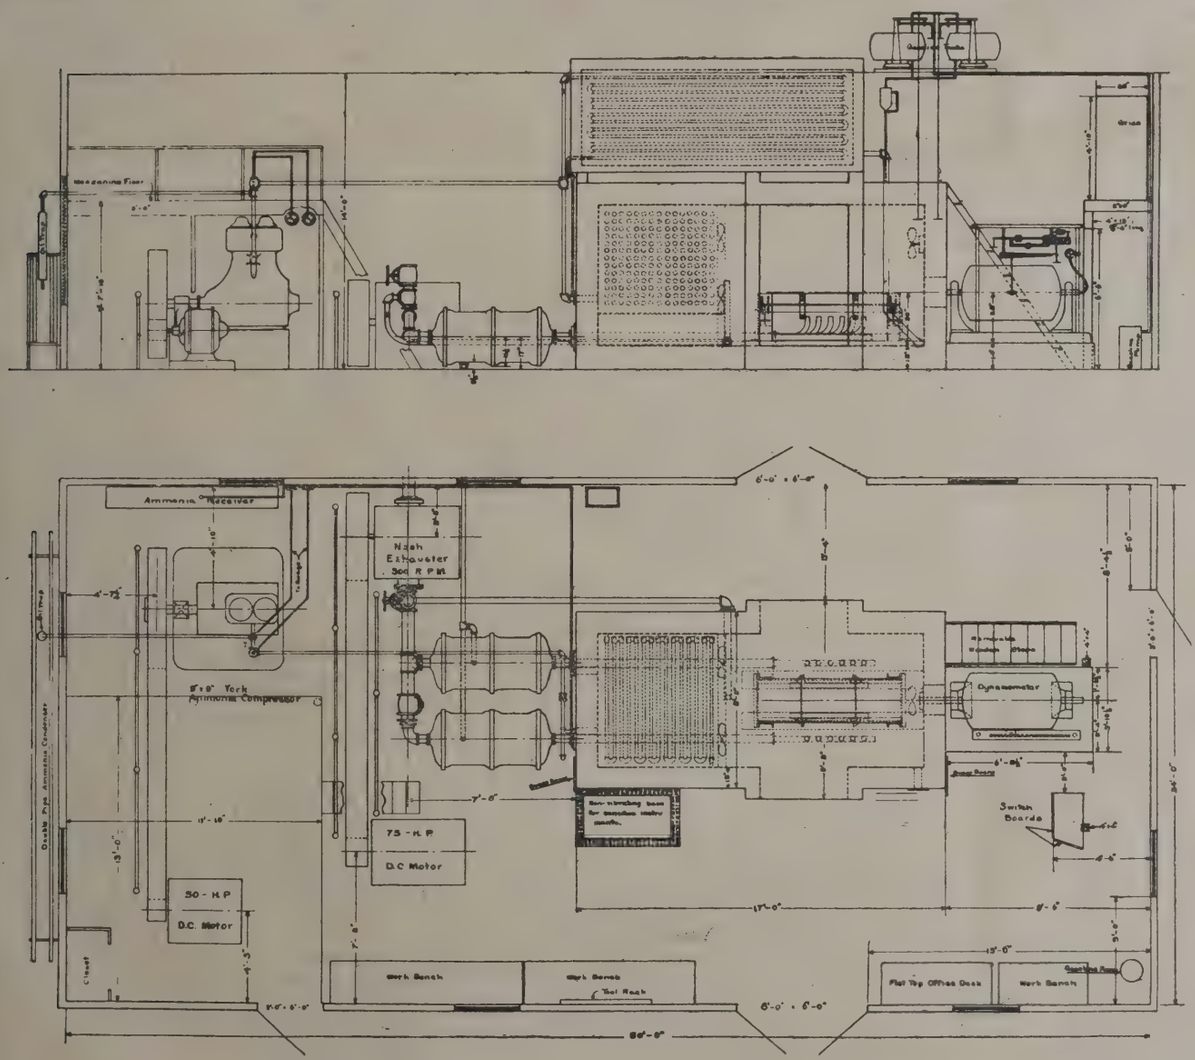
Briefly, the laboratory consists of a concrete chamber, within which the engine is mounted, and from which the air may be exhausted to any pressure as low as one-third of an atmosphere, by means of a centrifugal exhauster. At the same time the air is cooled to a temperature corresponding as nearly as possible to that encountered at the altitude of the test, by passing it over refrigerating coils. In the interior of the chamber electrically driven fans are mounted, which circulate the air over the coils and about the engine.

The power of the engine is absorbed and measured by an electric dynamometer and a water-brake mounted outside the chamber, and connected to the engine through a flexible coupling.

It will thus be seen that the conditions encountered in actual flight can be closely duplicated, while, at the same time, all the necessary data can be taken and easily recorded under the most favourable conditions for observation.

The altitude laboratory is housed at present in a temporary building of frame and stucco, having a rectangular floor plan, measuring about 24 ft. by 50 ft. In the near future, the present equipment, together with a duplicate set of apparatus, will be set up in a permanent brick and concrete structure, which is being built especially for this purpose. There are no features of the present building to call for special comment.

The Altitude Chamber.



The altitude chamber is of concrete, 6 ft. 2 in. wide by 15 ft. long by 6 ft. 6 in. high, inside measurements. The walls of the chamber are 1 ft. thick, heavily reinforced with ¾-in. steel bars to withstand the pressure of the atmosphere outside the chamber.

The chamber may be considered as divided into two parts; the first containing the engine, and the second the cooling coils. The engine is mounted on a special stand at the right end of the chamber. In order to control the engine during a test, cables are led from the spark and throttle levers, etc., through holes in the walls. The walls are also pierced for the necessary pipes and wiring, each hole being closed by a flange and gasket, through which the connections are made.

The Engine Support.

The engine support was designed to reproduce, as nearly as possible, the flexibility and the inertia of the typical fuselage mounting. The design developed makes possible an accurate adjustment of stiffness as regards transverse and vertical vibration and rotation about each of the three principal axes of the engine.

Two oak beams, in this case 2 in. by 6 in., by 6 ft. 3 in. long, are supported at the ends to form the basis of the mounting. The engine is mounted directly on two supplementary beams, of 2 in. by 4 in. section, and of the length required for the particular engine under test. These supplementary beams are free from the main beams, except at two points, where they are bolted together through a thin separating block. Two yokes are provided to pre-

Plan and elevation of the "Altitude" laboratory of the Bureau [illegible]

vent torsion of the individual beams, but have no other effect, as they are free from contact with any other part of the structure.

The Air-Cooling System.

The air-cooling system may be divided into three parts, the refrigerating plant, the cooling system for the carburetter air, and the cooling system for the interior of the altitude chamber.

The refrigerating plant is installed in the left-hand portion of the building. The ammonia compressor is a 9 in. by 9 in., double cylinder, vertical, enclosed machine, with a refrigerating capacity of 25 tons in 24 hours. belt-driven from a 50 horse-power electric motor.

The cooling system for the carburetter air consists of a bank of ammonia coils mounted on top of the altitude chamber, and enclosed in a box and insulated with 4 in. of sawdust. The air is made to pass through this box in a tortuous path, and is then led through an insulated pipe provided with a set of electric-heating grids and a regulating valve to the test chamber, and then through the air meter to the carburetter. In this way warm or cold air may be supplied to the intake as required.

The system for cooling the air within the chamber is made up of a smaller bank of ammonia coils, placed in the left-hand portion of the altitude chamber. Four motor-driven fans are provided to force the air over these coils, while another fan is installed to circulate the air past the engine itself when desired.

By means of the refrigerating plant and cooling system just described, it is possible to reduce the temperature of the air admitted to the carburetter and that within the test chamber to a point approximating the temperature at any altitude up to about 30,000 to 40,000 feet. As the temperature cannot be readily controlled by means of the refrigerating plant, the air, after cooling and before admission to the carburetter, is passed over a series of electric grids, by means of which the temperature may be again raised and kept at any desired point. Some difficulty has been experienced from the condensation of moisture which occasionally causes a "snow storm" in the air passage to the carburetter. It is hoped that this difficulty will be entirely overcome in the new laboratory, through the elimination of leaks into the refrigerating chamber and the use of what may be termed a "settling chamber," through which the air will pass after being cooled, and in which the air-flow will be so sluggish that the snow will be deposited.

The Circulating Water-Cooling System.

The jacket water-cooling system is arranged as follows:—

Above the altitude chamber is placed a cylindrical iron tank connected to the inlet and outlet pipes of the engine's circulating system, and with another pipe from the city mains, while an overflow leads to the sewer. A thermostat is placed within the tank, the brass rod of this device controlling a pilot valve which admits or discharges city water from a bellows, which, in turn, controls the main valve on the city supply pipe. In case the temperature of the water in the tank rises above a certain point, the thermostat causes the pilot valve to open, admitting water to the bellows, and thus allowing cold water from the city supply mains to flow into the tank. When the temperature has again fallen, the thermostat closes the pilot valve and allows the water to escape slowly from the bellows. Two coil springs then close the main valve, cutting off the supply.

The thermostat is mounted in the fitting through which the water enters the tank from the engine jackets, and also from the city mains. It is, therefore, very sensitive to slight changes in temperature; a very important matter, since even a comparatively slight variation in the temperature of the circulating water affects the heat distribution in the entire engine. In practice it has been found possible to hold the temperature of the jacket water to a variation of about 5 deg C.

The Exhaust Cooling System.

The exhaust pipes connected to the engine are water-jacketed, the inner pipe extending down about three feet from the exhaust port, while the outer pipe or jacket is continued from the exhaust port to the main exhaust manifold in the form of a flexible tube. The water from the annular space mixes with the exhaust gases only at a point a considerable distance from the engine.

The mixture of exhaust gases and water passes through two 5-inch pipes to the auxiliary exhaust tanks, placed just outside the chamber. Here the water is drained off while the gases pass to the exhauster.

The Exhausting System.

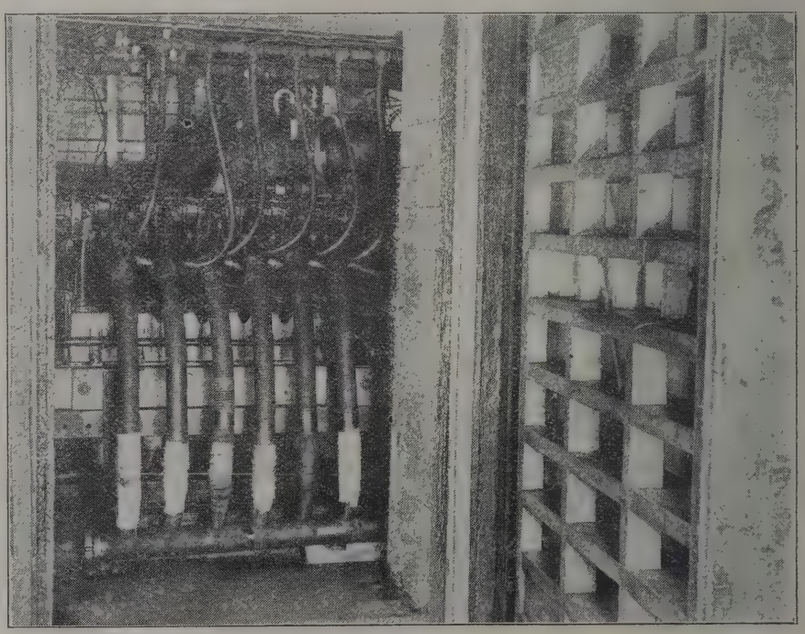
The auxiliary exhaust tanks are both connected to a 6-inch main which leads to the centrifugal exhauster. Another 3-inch pipe is led from the main directly to the altitude chamber and serves to withdraw the air from the latter, thus maintaining the barometric pressure on the exhaust and within the chamber approximately equal. By means of a valve communicating with the outside air, placed near the exhauster the pressures maintained may be easily regulated, irrespective of the speed of the pump.

The exhauster is of the Nash "Hydroturbine" type, and has a rated capacity of 1,500 cubic feet per minute at a 12-inch vacuum, at 300 r.p.m. It is belt-driven from a 75 horse-power, direct current motor, and discharges to a point outside the building.

The Dynamometer.

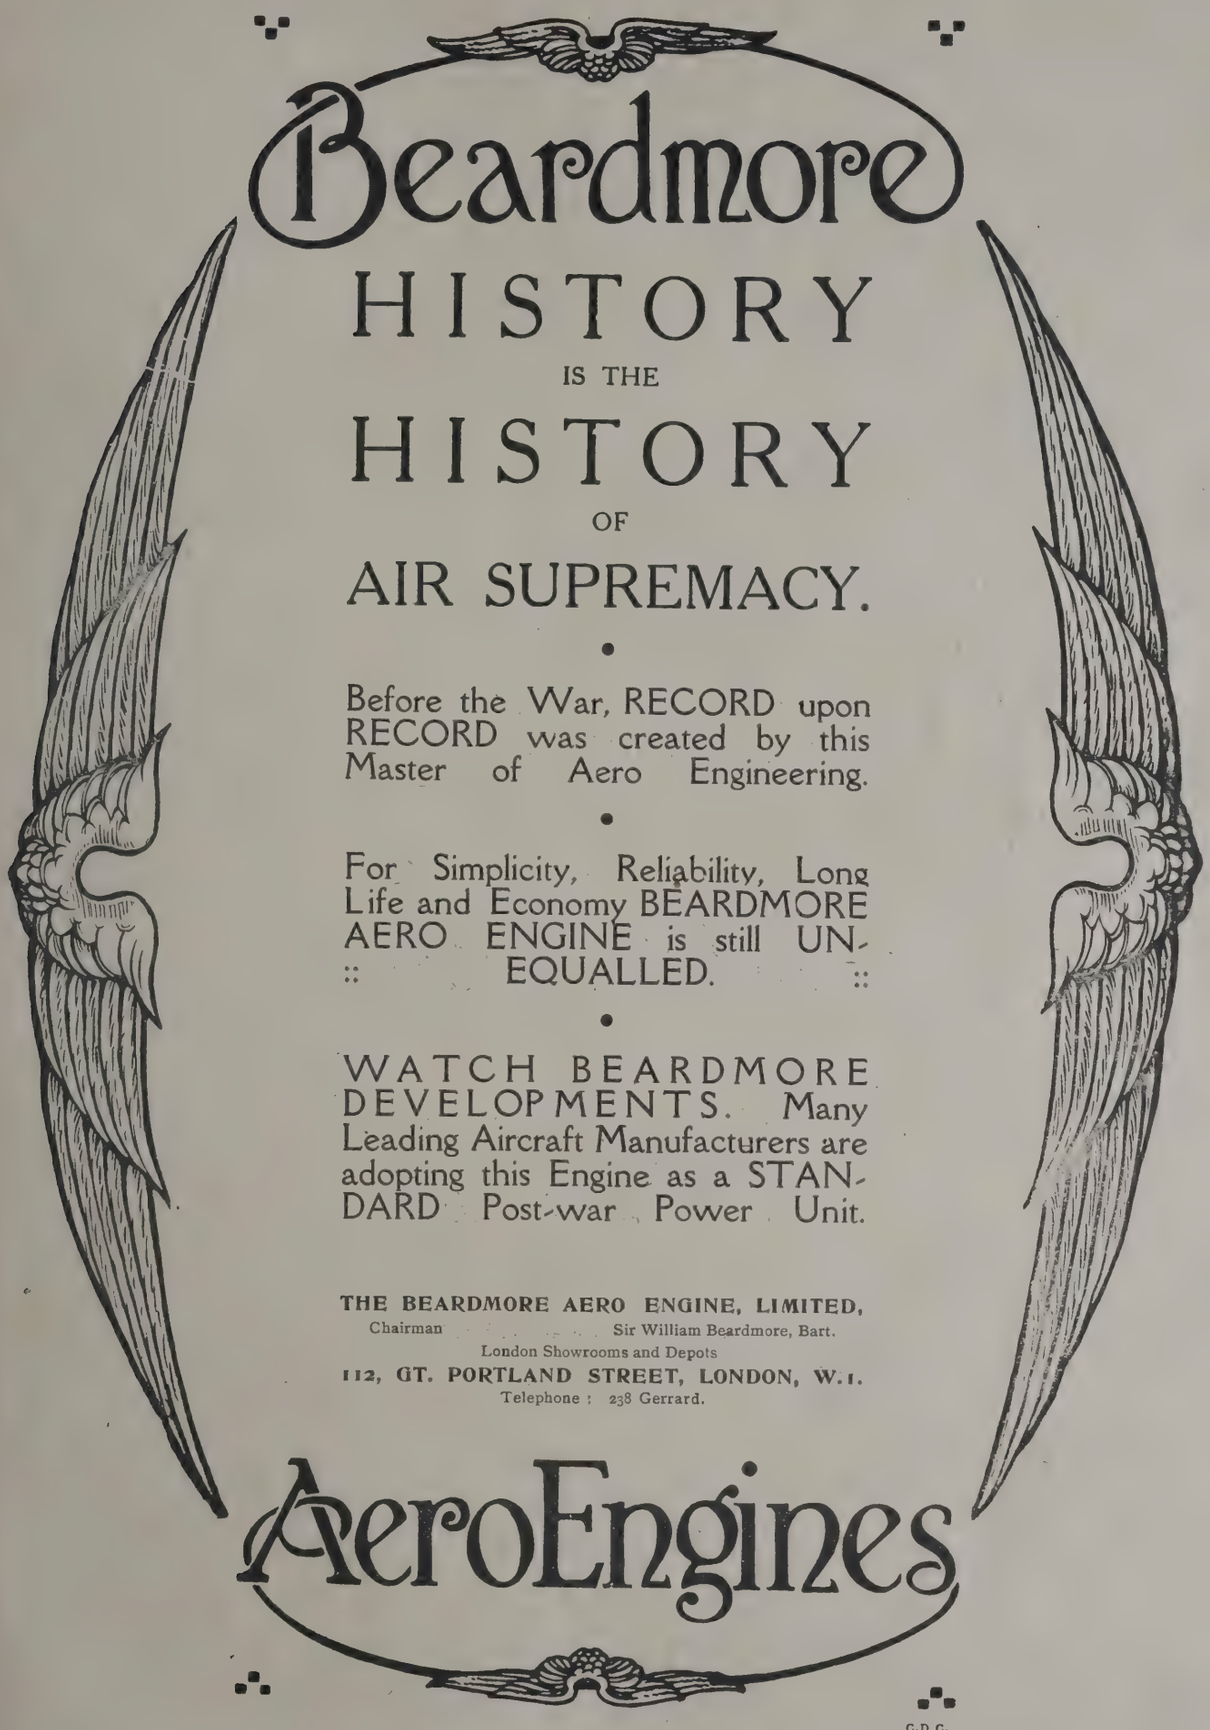
The connection from the engine to the dynamometer is made through a flexible coupling.

The electric dynamometer is mounted on a concrete foundation at the right of the altitude chamber. It has a rated capacity of 300 horse-power, though it is capable of caring for considerable overloads. The dynamometer consists essentially of a direct current generator, the field ring of which is free to rotate with the armature, except as this rotation is opposed by a connection to a scale beam, which, therefore, measures the torque delivered to the machine. An auxiliary spring balance is also used, interposed between the torque arm of the dynamometer and the scale beam, which serves as a handy means for measuring the approximate torque. Current from the dynamometer is controlled from a switch-board placed near by, and may either be dissipated in grids placed outside the building, or may be returned to the regular power lines of the Bureau.



As the plant was originally laid out for the "Liberty 8" engine, before the "Liberty 12" was decided upon, the 300 horse-power dynamometer selected for the purpose is not capable of carrying continuously the full power of the latter engine. Hence, it was necessary to increase the capacity, which was done by the addition of a specially designed water-brake. This brake consists of alternate fixed and rotating perforated steel plates.

The rotor is mounted on the shaft of the electric dynamometer, and the stator is mounted on the dynamometer field, so that the two always operate together; yet the water-brake, when empty, does not interfere with the operation of the electric dynamometer. The water-brake alone can absorb about 400 horse-power at 1,800 r.p.m.



A unique feature of this brake, made possible by the fact that it is integral with the electric dynamometer, which cares for the adjustments of load, is that it can be operated at any one of four fixed water-levels corresponding to four oblong outlets in the casing. When any one of these outlets is opened, and the rate of water-flow is approximately adjusted, a constant water-level is maintained, which is reasonably independent of small variations in supply pressure. Operated in this way the water-brake is quite satisfactory, being free from the tendency to "drift" towards higher or lower roads with small changes in water pressure.

The Gauge Boards and Engine Controls.

The copper tubes for the manometers and the engine control cables are all carried to two boards, so arranged that one man

AeroEngines

C.D.C.

can control the entire plant, and, at the same time, conveniently see all the measuring instruments. In this way the whole plant is under the observation and direction of the Chief Operator at all times.

The spark and throttle levers work in graduated quadrants, which indicate the exact positions of the levers on the engine.

The instruments mounted on the gauge board are as follows:

1. Venturi gauge for carburetter inlet air.
2. Barometer and thermometer.
3. Manometer for carburetter float chamber pressure.
4. Manometer for exhaust back pressure.
5. Auxiliary barometer.
6. Manometer showing average pressure in exhaust manifold.
7. Manometer showing the pressure difference between the entrance to the carburetter air venturi and chamber.
8. Venturi gauge for jacket-water.
9. Venturi gauge for exhaust cooling water.
10. Venturi gauge for oil cooling water.
11. Indicator showing fluctuations of chamber pressure from that desired.
12. Manometer showing average pressure in inlet manifold above carburetter choke.
13. Manometer showing difference in pressure between entrance to the carburetter air venturi and chamber.
14. Manometer showing carburetter choke pressure.
15. Manometer indicating the pressure difference between the exhaust port and the chamber.
16. Venturi gauge on gasoline supply line.

Besides the above, there are the regular gauges and indicators supplied with the particular type of engine under test.

A revolution counter, provided with a magnetic, as well as a hand-clutch, is attached to the dynanometer shaft.

Measurement of Air Flow to Carburetter.

Two means have been used to measure the amount of air flowing to the carburetter; a Thomas meter, and a venturi tube.

The Thomas meter used was specially built for the altitude laboratory, and consisted of a wooden box 6 in. square on the inside and 16 in. long, which contained a heating grid between two sets of thermocouples The principle of operation was simply that a given energy, put into the heating grid, would cause a rise in temperature (measured by the thermocouples) inversely proportional to the mass flow of air.

This meter was eventually destroyed in a small fire in the altitude chamber, and was then replaced by a large 6-in. venturi with a 3-in. throat. The venturi was calibrated against a second Thomas meter specially supplied by the Cutler Hammer Co.

Temperature Measurements.

The following temperature measurements are made by means of thermocouples:—

1. Temperature rise of oil cooling water.
2. Carburetter air at entrance to venturi meter.
3. Rise in jacket-water temperature.
4. Jacket-water outlet.
5. Exhaust cooling water inlet.
6. Rise in exhaust water temperature.
7. Chamber temperature.
8. Oil temperature at engine inlet.
9. Oil temperature at engine outlet.
10. Carburetter air.
11. Inlet manifold temperature.
12. Gasoline temperature.

Fuel Weighing Device.

The fuel used by the engine may be measured in either of two ways; by means of an accurately calibrated tank, or by two tanks mounted on platform scales. The first method gives the volume, and the second the weight of fuel used. When using the weighing tanks a test may be run continuously, one tank being filled while the other is emptying, or two fuels may be compared as follows:—

One tank is filled with the fuel to be tested, and the second with a standard comparison fuel. The engine is run first on the standard fuel, and is then changed over the test fuel, after which a third run is made on the standard fuel. In this way the least possible variation in engine condition is involved

Miscellaneous Equipment.

Suitable pipe connections are provided for obtaining samples of the exhaust gases from the engine, these samples being then analysed in an Orsat apparatus.

A compressed air system for feeding oil to the engine sump and a means for cooling the oil during a test have been installed

The laboratory is well supplied with tools and the necessary work benches, so that all ordinary small repairs to both the engines and plant may be made without outside assistance.

General Log of Operation.

Work on the Altitude Laboratory was begun in August, 1917, and the plant was ready for the preliminary installation of an engine for test purposes in November of that year. The first engine to be mounted in the chamber was a "Liberty 8," one of the first series of five engines built for experimental purposes. Although this engine was set up in the test chamber in November, there remained many minor items of experimental equipment to be completed and "tuned up" before tests could be begun.

The securing of air-tightness of the doors and other connections to the chamber, and a multitude of other minor matters, too numerous to mention, all took considerable time.

On Dec. 26th, 1917, the first test run was made with the "Liberty 8" engine for the comparison of two grades of fuel, and for data on the contamination and deterioration of lubricating oil.

On Jan. 4th, 1918, the first test at reduced pressure was made, the lowest pressure obtained being 44 cm. below atmosphere, corresponding to an altitude of about 25,000 feet.

In all, seven tests were run with this first experimental engine, representing about 15 hours actual running time. The records of these first tests show many stops for various causes, most of which were chargeable to difficulties with the engine. This was to be expected, as the 8 cylinder model had not at that time reached a stage of perfection to warrant its use for research purposes. In fact, at that time, this model had been temporarily abandoned in favour of the 12-cylinder engine, which was then being perfected.

On Jan. 19th, a connecting-rod gave way during test No. 8, and it was decided to abandon the "Liberty 8," then obsolete, and continue work with a Hispano-Suiza engine until the "Liberty 12" was in shape for research on altitude effects.

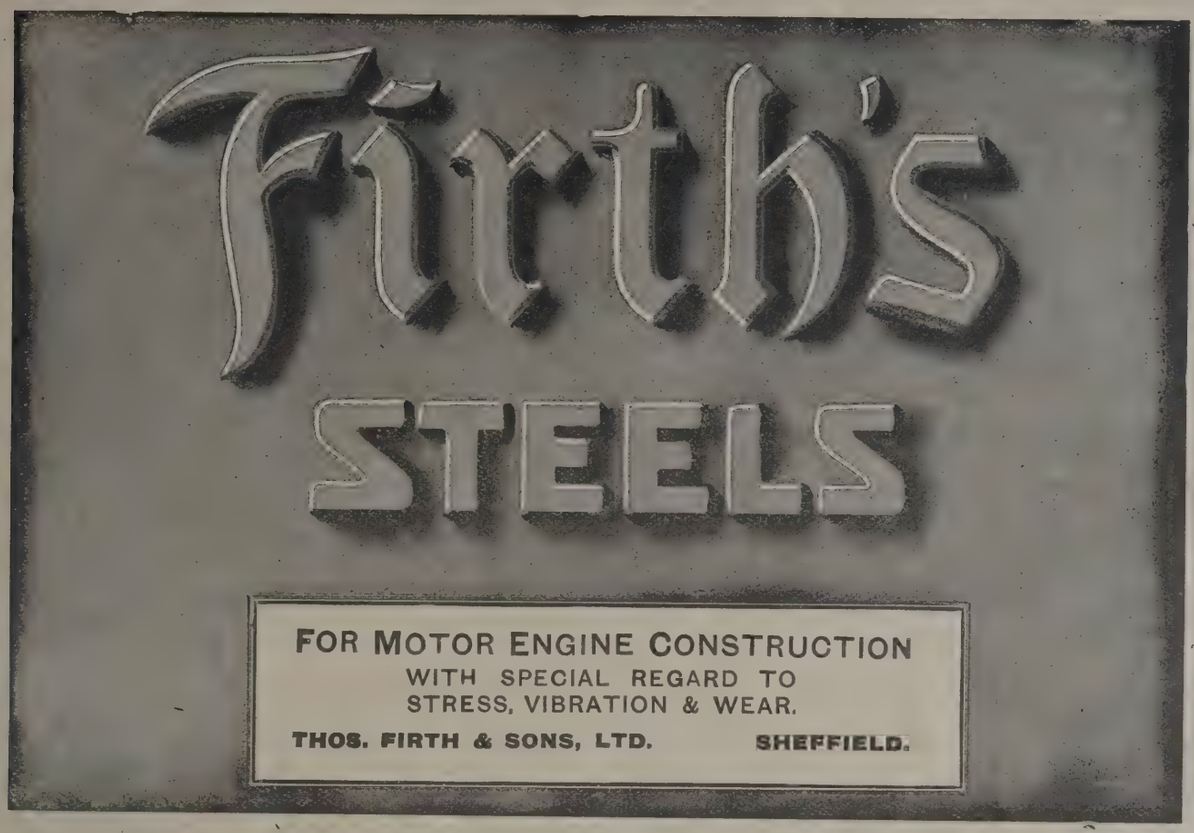
On Jan. 25th, the first experimental run was made with the Hispano-Suiza engine. This test included the first complete set of observations under conditions corresponding to a series of altitudes up to 30,000 feet.

In the year which had elapsed between Jan. 25th, 1918, and Jan. 31st, 1919, about 150 complete altitude "flights" have been made, comprising only a little less than 1,000 hours of actual engine operation.

Observations have been made with the following models of aircraft engines:—"Liberty 8"; Hispano-Suiza, 150 h.p.; Hispano-Suiza, 180 h.p.; Hispano-Suiza 300 h.p.; "Liberty 12," 400 h.p.

Of these models, several different engines of the 150 h.p. Hispano-Suiza, 180 h.p. Hispano-Suiza, and "Liberty 12" types have been included.

EMAILLITE DOPING SCHEMES FOR AIRSHIPS.



The British Emaillite Co. have long been connected with the Aeroplane "Dope" Industry, but it is little known to what a high standard of perfection they have worked in the more exacting problem of successfully doping rigid airships. The technical staff, under the control of Dr. J. N. Goldsmith, Ph.D., M.Sc., F.I.C., carried out lengthy experiments and tests with the result that they evolved a series of doping schemes for all kinds of aircraft coverings that were finally adopted as standard by the A.I.D. in 1916. When the Admiralty decided on the construction of rigid airships on a large scale it was only natural that the British Emaillite Co. should be approached, to tackle the problem of supplying a suitable doping scheme.

It must be understood that the doping of rigid airships is altogether different from the doping of aeroplanes where the dope is applied, more or less without restriction as to weight, to the fabric after it is stretched on the plane framework, and, therefore, free from further rough handling. In dealing with such a large surface as the covering of a rigid airship it is necessary that weight be kept down; consequently, the maximum weight allowed is 2 grams per sq. metre. Again, the fabric must be automatically doped before it is applied to the framework of the airship, and as the lacing has to be prepared after the proofing is applied, and, incidentally, it is rather roughly handled in the process, it can be seen that the necessarily thin protective covering must have sufficient pliability to retain it in as uniform tension as possible.

By the co-operation of the technical staff under Dr. Goldsmith and Mr. H. Bailey, the general manager of the firm, all difficulties were overcome with the result that in November, 1916, the Admiralty accepted the first Emaillite Doping Scheme for airships.

But this did not mean that the British Emaillite Co. were content to work on that one scheme. The technical department have continued, and intend to continue, their experiments, with the result that from time to time further improvements have been introduced. That the R34 should have completed the round journey —East Fortune, New York, Pulham—against almost every kind of weather condition is sufficient proof that the eminently useful work of the British Emaillite Co. has produced a highly successful scheme of weather-proofing.

The Airship Doping Scheme "P," as used on the R33 and R34, has since been improved, so that on the new ships under construction schemes known as "R" and "RA" are being used.

Can you smile at the day's work?

THE normal, *healthy* man can laugh at longer office hours of extra brainwork. Conscious of his strength, he sustains such burdens easily, making his decisions instantly because his brain and body are working in perfect accord. His vitality is renewed from a reserve of stamina, which provides unnoticed for such calls upon his strength as would cause depression, sleeplessness, and raw nerves to his less healthy friends.

THAT reserve of stamina, the source of his vigour and cheery optimism, can be built up by means of 'BYNOGEN,' which supplies the extra nourishment necessary to perfect health in the convenient form of a powder, which is pleasant to the taste and may be taken mixed with food, or dry.

'BYNOGEN' consists of glycerophosphates (organic phosphorus) combined with concentrated pure milk protein (the most powerful nutrient) and a soluble energising extract of whole-wheat and malt.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

THE OWNERSHIP OF AERIAL SERVICES.

By "MEDWAY."

In recent articles I have advocated the temporary ownership of experimental services in various parts of the world, either by individual manufacturers or by the aircraft manufacturing industry as a whole. There is all the difference between carrying out the proposition that I have outlined and adopting the principle of the establishment of services by manufacturers with a view to permanent ownership.

Personally, I am very strongly of the opinion that the manufacturer's business is to sell his products rather than to operate them. At the present juncture temporary operation is justifiable, because we want data for the encouragement of future sales. Once the business is properly established, it is not the job of the manufacturer to run his own machines. By all means let him give the fullest possible service to the owners of those machines, but if he is wise he will not himself remain their owner for a minute longer than is necessary.

An Analogy.

This is one of those points with regard to which we can take a line from the development of the commercial motor vehicle. Experience shows that directly the vehicle manufacturer begins to take big financial interest in operating concerns competitive operating concerns will certainly withdraw their orders from him and will probably settle down to manufacture for themselves in preference to purchasing from the established industry. They are in fact more or less compelled to do so if their requirements are anything approaching sufficient to absorb a decent output.

In the early days of the motor omnibus some vehicle manufacturers took a considerable interest in operating concerns. The policy may have been justifiable, inasmuch as by watching their vehicles in service the manufacturers gained useful experience in design and data as to running costs. The fact remains, however, that it is now very much the exception for any motor manufacturer to do more in the way of operation than is represented by, perhaps, the hire department. On the other hand, the big London omnibus companies have set out to manufacture for themselves. The moral is a sound one. If you do not want other people to cut into your business, do not cut into theirs. When a big organisation of motor traders began to father an insurance business a prominent insurance company promptly retaliated by going into the retail motor trade on an extensive scale. This sort of thing is inevitable.

The Legitimate Job.

It is primarily for the purpose of eliminating any idea that the manufacturer is out to compete with his own clients that I suggest that even experimental services should be worked by the industry as a whole rather than by individual concerns. I have deliberately harped on this string because I am certain very much depends upon our getting a clear idea as to where the manufacturer's legitimate job begins and ends.

From what has gone before, my readers will see that I am not among those who would criticise the manufacturer for not exhibiting his confidence in his own wares by going into the transport business. Such business is, of course, speculative for the present, and it is speculative from two points of view. We do not know what our total operating costs are likely to be, neither have we any reliable data to indicate tht probable growth of traffic receipts.

Every new transport concern, land, sea, or air, is to a certain degree speculative. Receipts may fall short of the estimates. Traffic may not develop as quickly as was anticipated. In any established system, however, the other side of the case—namely, the cost of operation—is, or should be, accurately assessable in advance. The experimental services that I have suggested would put commercial aeronautics fairly onto a level with other transport systems in this respect. So soon as this point is reached we have a reasonable proposition to put to any business man with a leaning towards speculation. We can, in effect, say: "If you choose to start a concern under such and such conditions, your costs will be so much per mile flown, or so much per ton-mile carried. It is for you or your expert advisers to judge whether you can within a reasonable period work up receipts so as to show a profit in face of these operating costs."

An Element of Guesswork.

Of course, if people are so faint-hearted that they will take no risk at all, until the extent of the obtainable traffic can be exactly gauged, we shall never make much progress. There is necessarily an element of guesswork at the present stage. A single serious accident might have a very damaging effect upon receipts for a long period. Such risks have, however, been taken in the past by the promoters of transport concerns of all kinds.

Let the manufacturing industry accumulate sufficient information to enable it to take the responsibility for the publication of data of complete operating costs on the clear understanding that if such costs are exceeded under the conditions specified, either the wrong machines have been chosen or else the methods of the operating company are hopelessly bad. The manufacturers ought to be able to indicate in general terms what those methods should be. I do not think they are yet able to do so, and I cannot see how they are going to accumulate the necessary experience except by working more or less along the lines that have been roughly indicated in these pages during the past few weeks.

R.A.F. PEOPLE IN THE AIRCRAFT INDUSTRY.

Among the aircraft firms employing late Air Force personnel is the British Aerial Transport Co., Ltd., at Hendon.

Major J. C. Savage, late R.N.A.S. and R.A.F., is the commercial manager, and he is assisted by Lieut. H. W. Hern, late R.N.A.S. and R.A.F. Major R. E. Nicoll, late R.N.A.S. and R.A.F., is in charge of flying operations.

The pilots are:—Major C. Draper, D.S.C., chief test pilot, late R.N.A.S. and R.A.F.; Capt. C. R. Vaughan, late R.N.A.S. and R.A.F.; Lieut. C. C. Turner, late R.F.C. and R.A.F.; Lieut. R. E. Duke, late R.F.C. and R.A.F.: Lieut. H. M. Russell, officer in charge of W/T, late R.N.A.S. and R.F.C.

The chief of the photographic department is Mr. G. Green, late serjeant R.N.A.S. and R.A.F.

Late R.N.A.S. and R.F.C. mechanics are also employed at the Flying Ground at Hendon.

The clerks are:—Mr. T. J. Dingley, late chief writer, R.N.A.S. and R.A.F.; Mr. E. W. Westfield, late serjeant-major Scots Guards and R.A.S.C., attached London Air Defence Area Staff.

Miss M. Rye, late personal clerk to Major-Gen. Sir Godfrey Paine, K.C.B., is acting as shorthand typist.

HANDLEY PAGE, LTD.

Everyone in England knows the name of the machines which night after night flew over Germany carrying tons of heavy bombs, and succeeded in putting the wind well up the inhabitants of nearly all the towns on the Rhine. In the daylight these big, slow machines would have been an easy prey to the fast enemy scouts, on account of their size, low speed, and "unstuntability," but at night, painted black, and almost invisible, with their big load of petrol, they could go right over Germany, and their chief troubles were the searchlights and the unpleasant "woofs" of Archie.

The war has been over for so long now that we have actually had the official Peace celebrations, but Handley Page, Ltd., are still constructing machines for the R.A.F. which are *not* being built in order to be reduced to produce. On August 1st, the R.A.F. took over a number of the V type 4-engined machines. One of their pilots, who should have known better, succeeded in getting into such a position on the aerodrome at Cricklewood that prevented the heavily loaded Bournemouth week-end trip machine from getting the run it should have had, but it managed to clear the trees by a few feet.

All the long-distance trains were crowded on the August Bank Holiday week-end. Waterloo was no exception. People waited hours scrumming in the crowded station for trains to the South. The weather was hot, and it could not have been at all enjoyable standing most of the journey or well squashed in a seat. One wonders, of those people who could afford it, how many knew that they could have travelled in coolness and comfort in a Handley Page machine that left Cricklewood on the afternoon of Friday, August 1st.

The machine had a load of five passengers, the pilot and four mechanics. Two passengers were seated side by side in the nose of the machine, they got the best view, and could hear each other talking. The pilot and a mechanic sat behind them. In the rear of the gigantic petrol tank there were six more seats on the top deck. The top of the fuselage, including the rear, machine-gun position, had been removed, and the passengers' heads came just above the fuselage. To get into these rear seats it was necessary to dodge the cross-bracing wires, but, having arrived, the possessors found the seats were most comfortable. Underneath these seats the luggage was stowed. Passengers are allowed to take as much as they can carry.

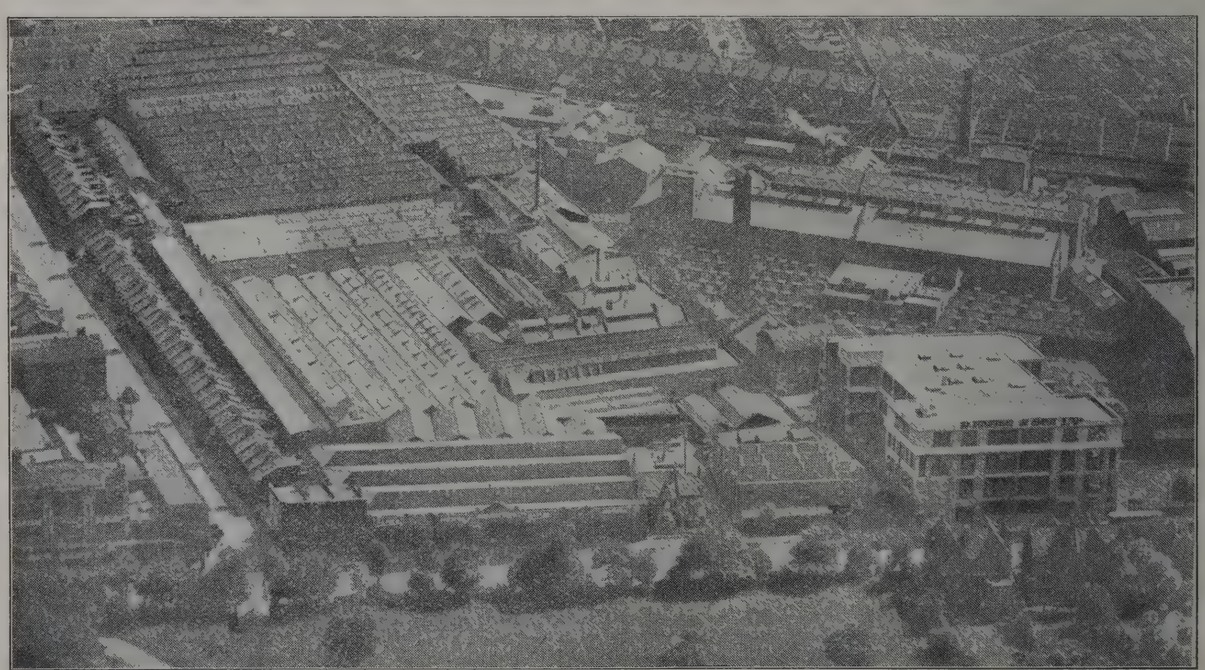
The machine, with its big load, left the aerodrome at 4.20 p.m. The Rolls-Royce engines had had their compression reduced to give them longer life. As the machine did not climb very well at first, the pilot made a wide circuit over Cricklewood. The climb improved, and so the journey was started. A machine, which looked like a B.A.T. Commercial, overtook and passed the H.P. very easily just after leaving the outskirts of London. The reservoirs at Staines were soon sighted and passed over, and then no town was sighted until Winchester was reached, from which it was possible to see the sea at Southampton.

It was very easy to see one large and three small fires that were burning in the New Forest. One realised the great use of the aerial forest patrol for spotting fires, which is in operation over the large American forests.

After passing over Brockenhurst the pilot crossed the coast at Highcliffe, and went about a mile out to sea before reaching Bournemouth, which was approached between the two piers. A successful landing was made at the rather small aerodrome of the Bournemouth Aviation Co. at 6.30 p.m. The flight was carried out at a height of 2,000 to 3,000 feet.

All the passengers were delighted with the trip. A man who had not flown before inquired if there would be any stunting, as he wanted notice before he was looped. He should have been told that the only pilot who tried to loop an H.P. is now very busy pushing up daisies.

A passenger, who must have weighed 16 stone, immediately on arrival at Bournemouth rushed to the station to catch the first train back to town.



One who had been a pilot in the R.A.F. was very glad he had not gone by train, although it would have been the quickest way of reaching his destination, which was some distance from Bournemouth. He was offered a parachute at Cricklewood with which to alight at his home, but graciously but firmly declined the offer.

The machine returns to Cricklewood most week-ends on Monday, bringing the passengers home in time for lunch in town. The fare for the single journey is five guineas, and for the double journey ten guineas. Tickets may be booked at the Lepaerial Travel Bureau in Piccadilly Circus.

Handley Page, Ltd., in one record week during the war, turned out 13 machines. At the present time, they are producing an average of six machines per week. They are making a number to the order of the Chinese Government

Two machines were sent to Amsterdam for the Exhibition. One, a four-engined V type, was exhibited in the hall. The other, a two-engined machine, with a saloon body, beautifully fitted up, will carry 20 people, including the pilot. It is fitted with two aerials. One encircles the fuselage, and the other is fitted inside the length of the wings. These are used for wireless telegraphy, directional wireless and for wireless telephony.

When civil flying becomes general, and trips can be made freely to other countries, the Handley Page will come into its own. In flights from London to Paris and beyond it will be able to carry more passengers with luggage than other machines. Although flights are made with success every week-end to Bournemouth, England is so well connected up with railways that such a comparatively slow machine as the Handley Page cannot compete successfully commercially.—G. I. D.

THE NAPIER WORKS AT ACTON.—An aerial photograph taken by Captain Gathergood (late R.A.F.). Although a French firm is in existence which takes photographs from the air for commercial purposes, little use of this form of advertisement has been made in this country. As most large manufacturing firms publish "bird's eye" views of their works, there should be a good field for a firm that would specialise in aerial photo graphs.

THE
SUPERMARINE CHANNEL TYPE FOUR SEATER FLYING BOAT

illustrated above has been designed and constructed by THE S.A.W., Ltd., Southampton, and passed for sea and air worthiness by the British Air Ministry. We have standardised this machine, which is fitted with folding wings, 160 H.P. Beardmore engine, and the latest and most up-to-date improvements in marine aircraft. We are using this model for our FLYING BOAT Passenger Service on the South Coast. Demonstration flights will be given by arrangement. Enquiries are invited for these machines, which we have ready complete for shipment to any part of the world. We are prepared to act as consultants to give advice as the result of our experience on the establishing of a Flying Boat Passenger Service. A FLYING BOAT Passenger Service is the best paying proposition to-day in Civil Aviation.

COMMERCIAL AVIATION IN FRANCE.

The following letter has been received:—

Sir,—While "Engineer Officer" and other armchair experts are showing at great length that there is no profit in Commercial Aviation, in France the following companies are operating at a profit without sitting on the fence waiting for subsidies:—

Societé des Avions H. and M. Farman.
Cie des Messageries Aériennes.
Cie Aériennes Française.
Cie de Navigation Aérienne.
Cie des Grandes Expresses Aériennes.
Societé des Transports Aeronautiques du Sud-Ouest.

Fares and freight rates are reasonable, being from one to two francs per kilometre, according to the size of the machine. The fares in the large 'busses average 1f. 25c., or 1s. a kilometre. The fares are:—

From Paris to Lille, 250f.
From Paris to Brussels, 365f.
From Paris to London, 400f.
From Biarritz-Bordeaux, 200f.

Freight, 10f. per ton per kilometre. The amounts paid for passengers and third party insurances amount to 20 per cent. of the fares.

Now that the subsidies are established, the amounts paid for carrying the post pay all running expenses, so that freights and passengers represent profits.

Commercial Aviation does show a profit even now, and next year the activity in France will nearly equal that during the war. There are seven other companies getting ready to operate next Spring in addition to those who propose working for British companies. JOHN STRONG.

COMMERCIAL AVIATION IN SCOTLAND.

The Superintendent of the Admiralty Meteorological Service (Mr. Hugh Duncan Grant, F.R.A.S., F.R.G.S., F.R.Met.Soc.) has recently put forward proposals for civil coastal seaplane services in Scotland. Much interest has been aroused up there in that and other commercial aerial schemes owing to the difficulties in inter-communication now experienced in many parts of Scotland.

The following is an extract from an article which appeared in the "Glasgow Herald" of July 25th, written by Major A. A. Walser:—

Aerial Transport in Scotland.

"In the southern portion of the British Isles, which is well equipped with railways, there is not so much scope for the transport of passengers and mails by air. Scotland, on the other hand, where conditions are somewhat different, seems to afford a profitable field for commercial aviation.

"There is no doubt that in certain parts of Scotland existing railway facilities are far from satisfactory, and this must necessarily have a deterrent effect on the development of the country. The northern districts and many portions of the west coast are so badly served with railways and cables that visitors are cut off from the outside world for all practical purposes.

"The difficulties and expense involved in rendering this part of the United Kingdom more accessible by building railways are very great. The Highlands do not lend themselves readily to the construction of fresh railways. Moreover, the population in many parts of Scotland is a very fluctuating one. In summer and autumn a considerable number of visitors from the South invade even the most remote districts. These visitors are largely drawn from the wealthier classes, eager to escape for a time from the turmoil of city life.

"The man engaged in affairs of State, the financier, the business man, and others, though anxious for a holiday, are not always in a position to cut themselves entirely adrift from their affairs. They must be within reach of news, and if necessary must be able to return to their respective spheres of activity in a reasonably short time.

"There is no doubt that many people are deterred from visiting the most beautiful districts of the North because they know the difficulties of travel and communication in those parts.

"It is here that aircraft would be used to great advantage. In many localities it would no doubt be difficult to construct aerodromes, but inland lochs, rivers, and sheltered waters along the coasts would afford suitable landing grounds for the seaplane. There are many ways in which aviation could materially assist in the development of Scotland. Chief amongst these is the delivery of mails and newspapers.

Seaplane and Aeroplane Routes.

"The scheme most likely to be successful would probably be one which combined seaplane and aeroplane lines working in conjunction. Two main seaplane stations established, as proposed by the Superintendent of the Admiralty Meteorological Service, one on the Firth of Forth, the other on the Clyde, could be the starting bases of their respective lines.

"The first of these would establish a regular service along the East Coast, and eventually extend to Inverness; the second would work on the Clyde and to the more important districts of the West Coast, and possibly extend along the Caledonian Canal.

"Intermediate stations would be established at regular intervals along the route, where landings could be effected when necessary. All along these routes a series of dropping stations could be established, at which mails and newspapers could be dropped by means of parachute. It would be comparatively easy for stations to signal to passing aircraft, stating whether they required machines to pick up passengers or mails, and it would be possible to arrange a code of signals whereby machines flying on the regular circuit would return to the head office with information gathered from ports all along the line.

"In conjunction with these two main coastal services, all the larger cities would in time have their aerodrome and be connected by aeroplane lines. A regular service between Edinburgh, Perth, and Inverness would very quickly pay its way, and would be of great assistance in the commercial development of the country.

Local Support.

"In conclusion, it might be stated that such a scheme as the one very roughly sketched out in the foregoing remarks would undoubtedly obtain the whole-hearted support and assistance of the Scottish landowners and corporations, who are eagerly inquiring as to the possibilities of a commercial air service to improve their communications.

"Hand in hand, but supplementary to the regular service of passenger and mail carrying machines, small groups of 'pleasure' machines established at the various holiday resorts, as well as near the larger towns, would not only reap profits for their parent company, but, if properly controlled, would go far towards popularising aircraft as a practical means of travel."

A NEW COMPANY.

The American Handley Page Company, with headquarters in Ogdensburg, N.Y., was incorporated on June 17th "to establish aeroplane routes within the United States to carry passengers and merchandise." The capital stock is $5,000,000.

PROTECTION TO THE EYES.

An officer of 29th Squadron, R.A.F., flying an Avro at Croydon, side-slipped, fell 100 ft., and crashed badly, hitting his head on the instrument board. The impact sheared off the nut of the petrol pressure release valve, which can be seen in the illustration embedded in one of the lenses of his Triplex goggles.

The Triplex lens of a pair of goggles in which a nut was embedded in a crash.

TRANSITIONS IN TRANSIT

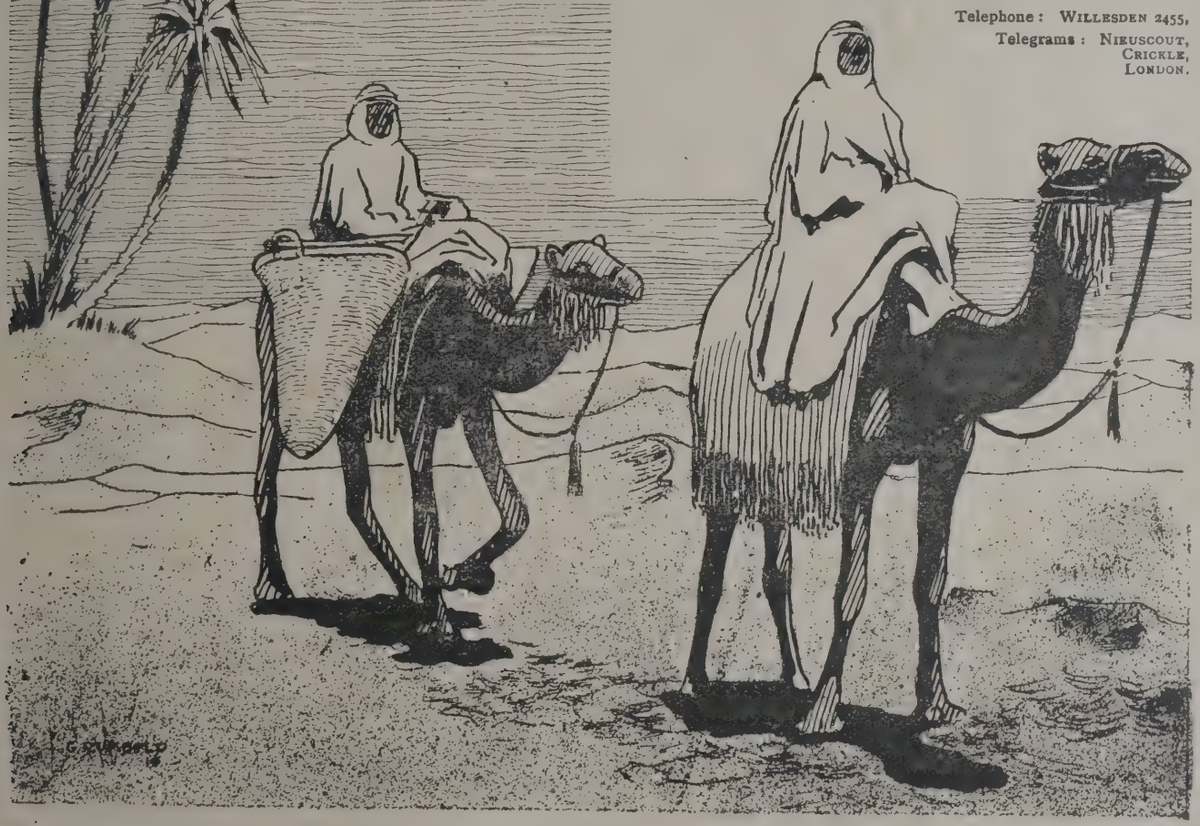
No. 3. The Ship of the Desert.

Blistering sand and a scorching sun.

The tinkling of Camel bells. The soft "sug—sug" of padded feet. The drowsy murmur of voices. These are the only sounds which break the simmering silence of the desert.

Plodding along the desert trails, the lumbering camel takes on an air of majesty which five thousand years' unrivalled supremacy has given him.

And now at last comes a monarch greater than he. The monarch of the sky—the Aeroplane!



The time is not far distant when the ship of the desert must give place to the ship of the air.

The machine illustrated above is the Nieuport single seater biplane.

CIVIL AERIAL TRANSPORT NOTES.

GREAT BRITAIN.

London-Paris Air Services.

The Air Ministry makes the following announcement:—

"Pending the final signature of the International Convention a provisional agreement to allow of flying between France and Great Britain from Monday, Aug. 25th, has been arrived at between the respective Governments."

Great Britain is so well served by fast railway routes that competition by aircraft is hardly possible. If passengers or goods were carried from London to any big town in the Midlands by aircraft the cost would be very high. It could not be less than one shilling per mile.

The passengers would first have to make a journey out of London to the aerodrome. At the other end of the journey they would have to be taken from the aerodrome to the town. The time taken in getting to and from the aerodromes added to the time in the air could not be much less than the time taken by an express train. A train takes one from the heart of one town to the heart of another. A railway journey costs 1½d per mile

An aerial service to the continent is a much better commercial proposition. The journey by land and sea to Paris is very long and quite costly. By air the journey can be made in 2½ hours by the Aircraft Transport and Travel, Ltd. Handley Page, Ltd., are charging 15 guineas for the trip.

The somewhat dry announcement of the Air Ministry has given the companies owning long-distance and large capacity aeroplanes an opportunity to show their worth. Two of the companies, at least, have not been long in taking the chance.

It was announced in The Aeroplane last week that the Aircraft Transport and Travel, Ltd., were starting a daily service to Paris on Aug. 25th. On Aug. 25th the service was started. A D.H.4a machine left Hounslow at 9.10 a.m. with a pilot, a Press representative, a number of newspapers, a consignment of leather, several brace of grouse, and a number of jars of Devonshire cream.

The machine arrived at Le Bourget (Paris) at 11.40 a.m. Left Le Bourget at 12.40 p.m. and reached Hounslow at 2.45 p.m.

A D.H.16 left Cricklewood at 12.30 p.m., piloted by Mr. Cyril Patterson, and carrying four passengers and goods. It arrived at Le Bourget at 2.45 p.m. This machine was announced to return to London on Aug. 26th.

Bookings of passengers have been received, covering the whole of the first week of the service.

Mr. Holt Thomas anticipates 80 per cent. efficiency on the service. The machines will leave for Paris every day that it is humanly possible to go. Whether there are passengers or not, they will go to scheduled time.

The Postmaster-General has not yet given permission for letters to be carried. In America they have found it actually cheaper and obviously quicker to send letters over long distance by air. The Post Office should realise the advantages of the speed of air transport. The aerial services would be put on a secure basis if they carried the mails.

Handley Page, Ltd., are starting a regular service to Paris and Brussels on Sept. 1st. Machines will leave at 12 noon for Paris on Tuesdays, Wednesdays and Fridays, and will return on alternate days. For Brussels they will leave on Mondays, Wednesdays and Fridays, also returning on alternate days.

The fare for the single journey, as before stated, is 15 guineas. Goods will be carried at 2s. 6d. per lb., with a minimum charge of 5s. The O.400 twin-engined type of machine will be used, with covered-in limousine fuselage, having seating accommodation for 14 passengers inside and two outside. In order to have a big margin of safety, only 10 passengers and 500 to 600 lb. of freight will be carried. The journey will take three hours.

For Paris the machines will land at the Le Bourget aerodrome. For Brussels at Evere aerodrome. Motors will be provided to take passengers from these aerodromes to the respective capitals. At present a stop has to be made at Hounslow to pass the Customs. It is hoped that sanction will be received to start the journey from Cricklewood.

As an experimental trip, a Handley Page left Cricklewood complete with 11 journalists on Aug. 25th at 8.30 a.m. to fly to Hounslow. This machine arrived in Paris soon after 10 p.m. It was due to return to London on Aug. 26th.

Accordng to the "Daily Express" of Aug. 22nd, some housewives are contemplating sending their laundry to Paris by air in view of the high prices and ruinous methods of washing in this country.

Arrangements have been made for copies of the "Times" newspaper to be sent daily by the service. These copies will be available for delivery to subscribers at special rates.

Free Flights.

The "Daily News" is offering free flights at the following places on Saturday, Aug. 30th:—Cricklewood, 100; Southend and Hastings, 20 each; and Great Yarmouth, 15. These flights will be the last given by the "Daily News" this summer.

Avro Flying in the North.

During the week ending Aug. 24th 766 flights were made in 17 Avro machines and 1,621 passengers were taken up at the following Avro stations:—Birkdale (Southport), Blackpool, Douglas, Fleetwood, Manchester, Rhyl, Waterloo Sands, and Windermere.

Manchester and Blackpool Air Service.

The Avro service between these towns has been run daily since the middle of May. The service is the first regular flying service to be run on civilian lines in the country. The time table, which is even published in the Manchester railway guides, is as follows:

Leave Blackpool 12 noon, leave Southport 12.15; arrive Manchester 12.45.

Leave Manchester 2 p.m.; arrive Southport 2.30, arrive Blackpool, 2.45.

Blackpool.

Many passengers were taken up in Avros during the week ending Aug. 24th, for the "wakes" were in full swing. The climax takes place this week, when the Oldham holidays are on. The five-seater Avros as usual did most of the passenger-carrying.

An engine was urgently wanted at Birkdale. One was put in a five-seaeter Avro and flown across the Ribble in 10 minutes. It would have taken the best part of a day to send it by road. The cost of transport was about £2 as against £5 for the hire of a lorry to take it round by road.

"Lucky," a famous music-hall performing dog was looped at Blackpool. He lost his flying cap and goggles during the trip. He climbed up the ladder to the aeroplane on two legs, drank the pilot's health and generally showed how thoroughly he enjoyed his flight.

Brighton.

During the week ending Aug. 24th thirty-eight flights were made in Avro machines at the Ladies' Mile Aerodrome.

Eighty-eight passengers were carried. The weather was indifferent, and no flying was possible on the 19th and 20th insts. On Sunday, Aug. 17th, a passenger and his niece were flown to Swanage and back.

Cambridge.

The Cambridge School of Flying charges only 30s. for a flight of 15 minutes over Cambridge on Avro machines. For 10s. passengers are taken up and may bomb a "circle" with sawdust bags. The youngest passenger carried so far was aged four. Most of the passengers are women, and nearly all request to be stunted. Motor 'buses are run out to the aerodrome from Cambridge (5 miles) on most Thursday afternoons.

Flying is taught on D.H.6 machines for £100, and on Avros for £180. They also have several Caudrons, but as they are not being licensed they will be written off.

An expert photographer will take photographs of passengers in the machines. Long-distance flights can be arranged, and the company claim that they charge down to 20 per cent. less than any other company for similar journeys.

Conway.

The site at the Morfa is being levelled and will be used as a landing-ground by the Avro Co. It is a fine centre for North Wales, the aerial views being magnificent. The air is very bumpy for flying, owing to the proximity of the mountains and the sea.

Fleetwood.

Passengers are taken up two days a week in an Avro machine by Lt. Macrae, M.C.

Harrogate.

A D.H.9 biplane is shortly expected to assist in making up passengers with the D.H.6 and the D.H.4a machines. The last machine will be used for daily flights to Redcar costing 10s. return.

Hunstanton.

Capt. Birkbeck, D.F.C. (late R.A.F.), of the Cambridge School of Flying has flown an Avro to Hunstanton, where he is taking up passengers.

Isle of Man.

Lieut. Moxon, flying on probably the most difficult aerodrome in the North, is carrying many passengers on Avro machines. He has started another licensed aerodrome at Ramsey, where the flying conditions are very much better.

Kendal.

A. V. Roe and Co., Ltd., are still negotiating with the landowners and Post Office authorities who have refused to lay their telegraph wires underground for a short distance. This would make the only good piece of ground in the neighbourhood suitable for landing on.

London.

Cricklewood.—A Handley Page, piloted by Capt. Shakespear, left Cricklewood Aerodrome on Aug. 21st with passengers for Brussels. Whilst the machine was circling over the aerodrome to gain height a messenger arrived on the ground with an important letter for one of the passengers.

CELLON

S.B.A.C. SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS

AMSTERDAM EXHIBITION

FULL PARTICULARS OF CELLON

from our agents

Messrs. R. S. STOKVIS & ZONEN, Ltd.

Stands 452, 454, 456 & 458.

Unsuccessful efforts were made to attract the attention of the pilot, and so the letter was taken by Major Meintjes in a fast two-seater machine, which overtook the Handley Page at Hounslow, where it had descended to pass the Customs.

HOUNSLOW.—A Vickers-Vimy limousine with 350-h.p engines and carrying fourteen passengers left Hounslow Aerodrome at 10 a.m. on August 20th. They flew to Amsterdam, where they were entertained to lunch by the Committee of the E.L.T.A. Exhibition.

During the week, ending Aug. 24th, 140 passengers were carried in Avro machines. Cross-country flights were made to Margate, Southsea, and the Isle of Wight.

MARGATE.

Although there was only four days' flying during the week, ending Aug. 24th, owing to the weather conditions, over 100 passengers were taken up in Avro machines.

MORECAMBE.

For five days a week Lt. Macrae, M.C., takes passengers up in an Avro machine at Morecambe, and is kept very busy.

NOTTINGHAM.

The Air Ministry has refused to sanction the flying in the "Forest" in the centre of the city for the flying week in the middle of September. A. V. Roe and Co. intend running a Nottingham-Derby air service at that time.

A commercial aeroplane service is about to be established at Nottingham. The promoters have acquired under Government sanction a site of about 30 acres near the river Trent, and the land is being adapted for an aerodrome. A start will be made with five aeroplanes for carrying passengers and goods. Special attention will be given to the transportation of lace, Nottingham's main product, which, being light in bulk, is specially suitable for the purpose.

PAIGNTON.

Four flights for lunch and two for tea were made to Teignmouth in Avro seaplanes during the week ending August 24th.

A race between the two seaplanes was arranged in conjunction with the Regatta for the afternoon of Saturday, Aug. 23rd, but as one of the machines was sent to Amsterdam it had to be scratched. It is hoped to arrange a race on August 27th.

PRESTON.

The Avro aerodrome has been licensed and requires a little levelling before passenger flying can take place.

RAMSGATE.

An Avro seaplane on its way from Southampton to Holland with a passenger was compelled to alight at Ramsgate on Aug. 25th owing to shortage of petrol. The machine was towed in Ramsgate Harbour undamaged.

RHYL.

Flying is very popular at Rhyl, and many passengers are taken up in the Avro machines. Capt. E. Maitland Heriot, D.S.C., has started upside-down flying as an attraction. The first time he did this, forgetting the laws of gravity, he inadvertently dropped a number of things out of his machine, which descended on the sands. The people there were very surprised at the sudden appearance of souvenir cards, tickets, and cushions from the sky!

Many people have come from St. Asaph, Chester, Birmingham, Denbigh, and Ruthin to fly, and inquiries for cross-country flights are numerous. When it is possible to reduce the fare there will be no dearth of bookings.

SCOTLAND.

During last week Capt. Simpson moved his two Avros from St. Andrews to Montrose, where 30 passengers have been taken up. This week he proposes to visit Dundee.

Aerial Photos, Ltd., of 81, George Street, Edinburgh, propose forming a Scottish Flying Club with centres in Edinburgh and Glasgow for the purpose of encouraging civil flying and commercial aviation in Scotland. Those interested are invited to write to the Secretary.

SOUTHAMPTON.

The Supermarine Aviation Co., Ltd., are carrying passengers in their flying-boats from Southampton to Bournemouth and the Isle of Wight. Passengers are also taken up at Southsea. The service will soon be extended to Havre and the Channel Islands.

SOUTHPORT.

The Sopwith Aviation and Engineering Co., Ltd., have the sole concession rights for making passenger flights at Southport. The Avro Company are taking up passengers at Birkdale near by. The Sopwith Company have three "Gnu" three-seaters and one "Dove" two-seater machines at Southport.

During the last six weeks Mr. King and Mr. Clapham have taken up about 1,000 passengers in two "Gnu" and one "Dove" machines. The aerodrome is in a central position adjoining the Pier and the Marine Drive.

SWANSEA.

Great interest was aroused on Aug. 15th by the arrival of the Swansea Town Crier, complete with his bell, on the Avro aerodrome.

From his pocket he produced a coil of rope which he seriously handed to the pilot with a request that he might be firmly tied into the Avro.

Then, for the first time, surely, a town crier was to be seen and heard flying above the main streets of the town plying his trade to the accompaniment of his bell and a 110 h.p. Le Rhône engine.

On Tuesday, Aug. 19th, a wonderful exhibition of aerobatics was given to the many visitors to Llandrindod by Capt. T. B. Bruce on one of the Swansea Avros.

During the week ending Aug. 24th, 24 flights were made and 47 passengers carried in Avro machines.

WATERLOO SANDS (LIVERPOOL).

Flying on this aerodrome takes place on Wednesdays and Saturdays, otherwise it is only used by the Avro machines as a landing ground.

WINDERMERE.

Capt. Pixton took the "Daily News" over to the Isle of Man several times during the week ending Aug. 24th. His trips are scheduled to take place when the midnight boats do not run from Liverpool, which is two or three times a week.

Passenger-flying is quiet, but improving, on Lake Windermere, where the air over the mountains is none too steady for flying. The Avro seaplanes are as reliable as the aeroplanes.

THE ARGENTINE.

A party, consisting of 16 French officer pilots and 44 picked mechanics, have embarked for Buenos Aires in connection with the French Aviation Mission to the Argentine Republic.

It is proposed to introduce a measure into the Argentine Chamber of Deputies providing for admission of aeroplanes into the country free of duty.

DENMARK.

The Handley Page machine piloted by Major T. Gran, which left Cricklewood on Aug. 17th for an aerial tour, as noted in the last issue of THE AEROPLANE, made several exhibition flights at Copenhagen. It left Copenhagen for Norway on Aug. 23rd, stopping at Aarhus, Jutland, at noon.

The Danish correspondent of THE AEROPLANE writes:—

Naval Captain Ulliditz flew last week as passenger with the German Capt.-Lieut. Reppert on his Brandenburg two-seater seaplane to Warnemünde, where he negotiated with various people regarding the possibilities of starting air lines to Copenhagen. They continued by air to Berlin on the same business and returned expeditely. Capt. Ulliditz has connection with the Danish Air Traffic Co. under formation.

Late in the evening of Aug. 13th the Farman twin Renault-engined Goliath No. 2 arrived in Copenhagen, carrying a pilot, two passengers and a mechanic. The rest of the 12-passenger seats were stored with spare parts. This machine is the first of such size to visit Copenhagen, and no shed at the aerodrome could house it, nor could the tent, which was erected for the special purpose.

A passenger said that great difficulties had been experienced in getting permission to leave France, and he himself had to call personally on the War Office. The giant aeroplane will stay for some days in the Danish capital, giving passenger flights.

After the inexperienced civil pilot, Dir. Nehm, had met with a fatal accident on an overland flight in an old, retouched Rumpler, he and his passenger being burned to death, civil flying has been forbidden, till the Air Bill before Parliament has been passed.

The provisory regulations requiring a safeguard of 10,000 crowns against third party damage and 60,000 crowns against third person hurting. This should speed up the efforts of Scandinavian insurance companies to tackle the new field of enterprise in union. Before being allowed to fly the pilot has to pass tests before the Commander of the Army Flying, Lieut.-Col. Koch, equalling those for obtaining a military certificate. Otherwise he must show papers of his flying career abroad.

The first to obtain a passenger-carrying brevet was the German, Hubricht, engaged as private pilot of one Mr. Tholstrup, who has repeatedly flown as passenger in a Brandenburg seaplane of his own, with the object of saving time in travelling to his dairies on the off-lying Danish island Bornholm. Mr. Tholstrup also owns half a dozen aeroplanes, including a Fokker VII. The others are L.V.G. two-seaters, the interests of which company he pushes. One of these biplanes has been flown on exhibition and joy-riding trips in Jylland, piloted by several Army aviators when on leave.

Now he has disposed of four L.V.Gs. and the Fokker to a new company which he has formed, with three Flight Lieuts., who have hired the Army aerodrome at Lundtofe, near Copenhagen, from where joy-riding, tuition and advertising flights will be carried out. This scheme was to have been carried out originally with Rumpler machines, and some were flown there: but, as the pilots had neither permit to export them from Germany, nor permit to import them into Denmark, they were arrested. They spoke of an invasion of 200 Rumpler aircraft.

You must show the World what you can do — You have been silent too long!

The BRITISH INDUSTRIES FAIR, February 23rd to March 5th, 1920, will give you an opportunity.

The goods you can show at Birmingham, and Birmingham only, are enumerated at side, and the manufacturers who take space there will be able to submit their products to all the largest buyers in all the markets of the World.

A National Trade Fair, every visitor will be there by official invitation of the Board of Trade, and for business purposes purely.

Every day the space available gets less, and although every suitable building in Birmingham will be utilised for exhibits, you must not delay in booking or — you'll be too late.

Apply now:—General Manager, British Industries Fair (Birmingham) 1920, Chamber of Commerce, Birmingham.

FRANCE.

An experimental postal service is being tried between Gabes and Tunis. On August 10th a 300-h.p. Breguet biplane did the journey in 2 hrs. 10 mins., as against 15 hours which is the time taken by the train.

The Farman "Goliath," piloted by Lt. Bossoutrot, which left Toussus-le-Noble Aerodrome on Sunday, Aug. 10th, to fly to Dakar, reached Casablanca in 17 hours 20 mins. without a stop. On the following Friday the flight to Dakar was resumed, and the last that was heard of the "Goliath" and its crew of eight was a wireless message asking for the direction of the wind on the Saturday morning. It was then near Cape Blanco, more than half the distance of the final stage having been accomplished.

A very systematic search was organised from Dakar, both by warships to search the coast, and by relief columns to search inland. For a week nothing was heard, and all hope had been abandoned as to their safety.

On the 24th inst. a message was received by the French Minister of Marine from the commander of the Naval Division in Morocco, stating that the "Goliath" had been discovered near the coast at a point 90 miles north of St. Louis with a broken propeller and that all the crew were safe. The delay in receiving the information was due to the fact that at this time of the year the native villages are deserted.

Commandant Wuillemin and Lieut. Dagnaux arrived at Cairo on Saturday, August 16th, having flown from Paris, with stops at Marseilles, Naples, Salonica and Constantinople. The last stage—Constantinople-Cairo—occupied nine hours' flying time.

On the 21st inst. two Portuguese aviators, Capt. Souza-Maia and Lt. Portila, on Bréguet biplanes, flew from Paris to Brussels, en route for Amsterdam in 1 hr. 38 mins.

The French reliability and endurance competition promoted by "L'Avenir" has, it is stated, been abandoned owing to the difficulties in the way of getting the competing machines ready in time.

The annual International Exhibition of Aeronautics, organised by the Chambre Syndicale des Industries de l'Aéronautique, will be held at the Grand Palais in the Champs Elysées from December 19th next to January 4th, 1920.

The exhibits will be classified in eleven groups as follows: (1) Aerostatics; (2) heavier than air apparatus; (3) motors and propellers; (4) sciences; (5) art; (6) structural materials; (7) transport and shelters; (8) cartography and bibliography; (9) commerce; (10) motor navigation; (11) various industries.

M. Malicoir, flying a Caudron biplane, flew twice under the Bridge of Var near Nice. The span of the bridge is 65 feet and the height 20 feet, as compared with the 45 feet span of the Caudron.

Capt. Leune, accompanied by a wireless operator and a mechanic flew from Paris to Rome. Between Corsica and Gênes the machine ran into a violent storm and for two hours and a half the pilot was completely lost over the sea. On landing at Rome it was found that the airscrew and the leading edges of the planes had suffered severely.

M. Fronval on a 110 h.p. Le Rhône "Parasol" monoplane flew from Paris to Amsterdam, a distance of 450 kilometres, in 2 hrs. 28 mins.

M. Poulet, the well-known Caudron exponent, is practising on a Caudron-Le Rhône biplane for a flight from Paris to Melbourne.

GERMANY.

The German police system has been reorganised, and provision has been made for a corps of flying policemen. Their duties will be to prevent capital leaving the country and to hunt and catch criminals. A landing-ground for police aeroplanes is being made now on the Swiss frontier, and similar stations are planned for Hamburg, Hanover, Breslau, and other towns.

The "Nieuwe Rotterdamsche Courant" states that, owing to the lack of material, the aerial mail service in Germany cannot be resumed for some time. Flights will be made only when authorised by the Government and other authorities. At Swinemunde and similar north coast holiday resorts joy-flights are still being made, but at very high prices.

Professor Junkers demonstrated his first limousine in passenger flights at the Johannisthal aerodrome on Aug. 6th. The machine was his 160 h.p. Mercédès-engined, wireless, all-metal (aluminium) monoplane for six persons, with an enclosed cabin for four passengers. The speed attained was 105 miles per hour.

The daily Zeppelin service between Berlin and Friedrichshafen, on Lake Constance, has been advertised by the D.L.R. Company to start on Aug. 24th.

A small type of Zeppelin has been constructed for this service. It is about 400 ft. in length, has a capacity of 20,000 cubic metres, and is said to be able to carry 10 to 12 tons. It has four engines giving about 1,100 h.p. and a speed of 77 m.p.h.

The passenger cabin contains 20 easy chairs and can accommodate 25 persons. It contains also a wireless telegraphy apparatus, a lavatory with running water, and a canteen, where hot and cold food and drinks can be obtained.

At first the flight will be made one way only each day, without making a landing en route. The 373 miles will be covered in seven hours. From Sept. 5th landings will be made at Munich on every journey. The fare for the whole distance is 400 marks, and Berlin-Munich 350 marks. Each passenger will be allowed 30 lb. of luggage.

The Government have made arrangements to use their passenger Zeppelins for the conveyance of letters and parcel post. For letters a small extra charge will be made. The "urgent" rate for parcels will be charged plus five marks for every kilogramme.

The service started on Aug. 24th with the Stan-dirigible "Bodensee," belonging to the Delag (Deutsche Luftschiffahrts A.G.), after repairs by the Luftschiffbau Zeppelin.

The airship left Friedrichshafen at 10 a.m. on its first trip to Berlin.

It carried 10 newspaper representatives and 13 other passengers, including three women.

The airship arrived over Berlin at 4 p.m. and landed at 5 p.m. at Staaken, near Spandau.

The Danish correspondent of The Aeroplane writes:—

The German coal strikes have influenced commercial aviation so much that the Sablatnig Traffic Co. and the German Aerial Shipping Co. had to stop their service on July 31st, owing to the lack of fuel, as only home-produced benzole was available, and there was not enough of that.

The latter enterprise states that the prospects for the near future are not good, and regrets it, as August and September would probably have turned out the best flying months. Special flights to order may soon be carried out with foreign petrol, but at much increased cost, as the price of this petrol will be five to six shillings against 1s. 3d. of benzole.

The company recently suffered the loss of one of its passenger aeroplanes near Johannisthal in an accident that cost half a dozen lives.

The twin-engined aircraft are equipped with parachutes. Lieut. Treibner jumped from 1,500 ft. during a passenger flight at the Johannisthal aerodrome on July 19th with a Heinike parachute. On July 21st the control of the latter was proved, as the wind drove him over unsuitable ground and he increased his falling speed by serving the central cable.

Piloted by Engineer Schwandt, a new A.E.G. twin-engined biplane has put up a new world's record for altitude flight with eight passengers.

HOLLAND.

E.L.T.A. News.

On Aug. 12th a Caudron machine, piloted by Boulard, collided with an Avro machine. The damage was slight.

The Avro "Baby" flew from Hamble to Amsterdam via Hounslow on Aug. 14th. The non-stop flight from Hounslow to Brussels took 2 hours 50 min. No trouble of any kind was experienced en route. A number of spares was carried. The machine has made a good impression at the E.L.T.A. Exhibition.

Two Avro seaplanes have also left Hamble for the Exhibition, where they will take up passengers. Nine Avros have now been dispatched to the E.L.T.A.

The only drawback to flying there is the sand which has been pumped out of the canals on to the aerodrome. It gets into the engines and causes the mechanics a good deal of trouble.

On Aug. 15th one of the Spyker machines fell from a height of about 30 ft. The propellers and the undercarriage were smashed and one wing was destroyed. The pilot, Serjt. V. D. Grient, escaped with injury.

A "Vickers-Vimy-Commercial" aeroplane, piloted by Captain S. Cockerell, carrying numerous copies of the London daily papers, left London for Amsterdam at noon on Thursday, Aug. 21st, and arrived at its destination at 3 p.m. The papers were then sold for a local charity.

Local flights were made by Verstugh on a Spyker, Mr. Duke on a B.A.T. "Bantam," Signor Guglio Motti on an Ansoldi, Capt. Stanley Cockerill on a Vickers "Vimy," and a Handley Page flew to England.

The Blackburn Aeroplane and Motor Co., Ltd., are exhibiting one of their big "Kangaroo" bombing machines converted for passenger-carrying at the E.L.T.A. Exhibition.

The machine was flown from Hull *via* Hounslow by the Blackburn test pilot, Mr. R. W. Kenworthy, and averaged a speed of 90-100 m.p.h. on the journey.

The trip from Hull to Hounslow was made in two hours. The next stop was made at Marquise for petrol. At Evere, near Brussels, a good landing was made, although part of the aerodrome was under water and it was getting dark and foggy. H.M. King of the Belgians viewed the machine at Evere.

Amsterdam was reached from Brussels in two hours. After circling round the E.L.T.A. Aerodrome for an hour till he understood from the authorities the best place to land, the pilot made a good landing.

The Handley Page and the Vickers Vimy cannot fly there on account of the bogginess of the aerodrome, but the Kangaroo has been taking up passengers, seven at a time, all day since its

THE ROYAL AERO CLUB,
3, CLIFFORD STREET, W.1.

30th June, 1919.

Messrs. Burberry's,
Haymarket,
London, S.W.

Dear Sirs,

I am writing to tell you how very satisfactory the outfit has proved which I ordered from you for the Atlantic flight.

Although in continual mist, rain or sleet and the altitude varying from 200 to 11,000 feet causing great variation in temperature, I kept as dry, warm and comfortable as possible under such conditions.

This was a wonderful achievement even for "Burberry" especially considering that I never adopted any electrical or other artificial means of heating; and that no rubber or cement is used in your waterproofing.

I feel you are entitled to know how pleased I was with your airman's dress.

Yours faithfully,
J. Alcock
Capt. D.S.C.

Burberry Carapace Airsuit
The Burberry outfit worn by Sir John Alcock and Sir Whitten Brown on their Atlantic flight. Provides a wealth of luxurious warmth and comfort under the severest conditions. 2282

arrival there. Numbers of people wish to fly in the Kangaroo, and many offers have been made for seats for the return journey to Leeds or Hull.

The Blackburn Co. may send another Kangaroo to the Exhibition. Their other exhibits are models of the Cuckoo torpedo-carrying aeroplane and the Nib, a small flying-boat.

INDIA.

The Indian Government had decided to carry aerial mails in its own aircraft. It has now reversed its decision and has decided that everything shall be done by contract. A large number of aviation experts is expected from England at the end of the year, when it is expected that the preliminary arrangements will be completed.

The British mails will be landed probably at Karachi, and will be distributed over the country by subsidiary aerial services.

Sites for the aerodromes have been selected at all the principal cities except Bombay, where land is very expensive.

ITALY.

Reuter states that the Italian dirigible "M.1" left Rome on Aug. 25th with 20 passengers on board, including a party of journalists. It arrived at Naples after a three hours' flight, and circled over the town. The dirigible was due to leave for Rome again in the afternoon.

Signor Gabriele D'Annunzio is giving his whole time to the organisation of the Rome-Tokio flight. Five SVAs. of the two-seater Vienna type, with big radiators and tanks, will compose the escadrille.

The journey is expected to take 15 days and will show the value of organisation and regular performance rather than of speed or brave expedients. It will not be attempted till October. They are arranging to stop at Salonika, Adalia, Bagdad, Bassorah, Raratti, Delhi, Agra, Benares, Calcutta, Rangoon, Bangkok, Handi, Canton, Shanghai, Kiao-Ciao, Pekin, somewhere in Corea and Osaka, and then Tokio.

A three Liberty-engined Caproni triplane piloted by Capt. Laureati flew from the Taliedo aerodrome, Milan, to Orly, having flown over the Alps. The journey was resumed next morning for Amsterdam, via London and Brussels.

With regard to Taddeoli's flight over the Alps on a Savoia—S.I.A.1—S.13 type seaplane with an I.-F. 250 h.p. engine from Lage Maggiore to Geneva, it is well to remember that Taddeoli, though in the service of Italy, is Swiss, and one of the first to do waterplane flying. A small sister machine was at the Taliedo Show.

The linking up of the Italian to the Swiss lakes was a scheme dear to Oscar Bider, lately deceased, who was hoping to promote a company with this object. One hopes his death will not cause the scheme he initiated to be dropped.

Messrs. Thos. Cook and Son have advised that the dirigible and aeroplane excursions over the Roman countryside are suspended. This is the natural result of the heat and the slack period of the year.

Messrs. Isotta-Fraschini, of Milan, have stated to the Press that neither of the three engines on the Caproni which crashed at Verona were products of their firm. Presumedly they were Fiats, or, possibly, Liberty engines.—T. S. H.

SOUTH AMERICA.

The American Consul at Buenos Aires reports that an aeroplane service will be established within a few months to connect Buenos Aires with Bahia, Brazil, and intermediate cities.

SPAIN.

Captain Truelove is on his way to Spain with a standard Avro machine painted with the Spanish national colours. This machine will give demonstrations before H.M. the King of Spain and in various parts of the country.

SWEDEN.

The Scandinavian correspondent of The Aeroplane writes:—

The first two flying-boats for the new Swedish Air Traffic Co. have arrived in Stockholm. They hope to start services soon to Helsingfors (Finland), Berlin, Malmoe and Gothenburg, the flying time to be respectively: Five, seven and a half, four and three hours.

SWITZERLAND.

Lieut. Ackermann with a passenger left Thun in an aeroplane at 5.30 a.m. on August 17th to fly to the Jungfrau. They flew round the Aletschhorn and the Eggishorn. The pilot was about to land near the Jungfraujoch, where a landing-ground had been prepared, when the machine nose-dived and fell into the snow on the side of a crevasse. The machine was scarcely damaged and can be repaired on the spot.

Another aviator attempted the same exploit on August 19th but also crashed, hitting the ground twenty yards from the landing-place.

A Commission, consisting of sundry Swiss Army officers and the aeroplane constructor, Largier, have visited Jungfraujoch, with a view to finding a suitable landing-ground thereon in order to open up a passenger service over the Jungfrau.

An aerodrome has been built at St. George's, near Geneva, with accommodation, so far, for four machines. It is rumoured that an English firm is about to run a regular service, London-Interlaken, with a landing at Geneva, with machines capable of carrying twenty passengers.

UNITED STATES OF AMERICA.

There were 62 entries for the New York-Toronto Air Race on Aug. 25th. Buffalo, Syracuse, and Albany are the intermediate landing places.

Out of the 45 machines due to start from New York, 40 started. Three of these were S.E.5. machines, and one carried a letter officially inviting the Prince of Wales to visit New York.

The American competitors started from Roosevelt Field, Long Island, at 1.55 p.m. The first machine to leave was a La Pere. The second machine, piloted by Capt. Foote, carried a message from President Wilson to the Prince of Wales, inviting him to visit America. The other competitors left at five-minute intervals. Capt. Foote was the first arrival at Albany, and reached there at 3.16 p.m. Colonel Barker, V.C., D.S.O., M.C., flew a Fokker machine.

Only 12 out of the 17 machines entered for the race, started from Toronto.

The Prince of Wales was to start the machines from Toronto.

The first arrival at Buffalo from Toronto reached there at 1.25 p.m. Another machine landed there one minute later.

The prizes, which were worth $10,000, were given by Mr. John McE. Bowman, the President of the Hotel Commodore Co. A committee, composed of members of the American Flying Club and the Aero Club of Canada, had charge of the arrangements.

The "Aerial Age Weekly" of August 4th states that the longest flight undertaken by civilian fliers in a flying boat since 1914 will start from New York early next month, when Majors S. E. Parker and G. Talbot Willcox, late R.A.F., will set out for New Orleans by the inland water route. They may continue their flight around the Gulf of Mexico to Panama and South America. The machine used will be a Curtiss "Seagull" equipped with wireless telephone and telegraph.

The U.S.A. Government proposes to establish three aerial mail routes radiating from Bogota, Columbia. Bids will be received from Nov. 20th from companies willing to provide aircraft to make trips on days designated by the Government. The bidders have to deposit 10,000 dols. with the bids and to give a guarantee of 40,000 dols. that they will carry out the contract. They must agree also to forfeit 5,000 dols. for each failure.

Secretary Daniels has authorised the sale of 265 surplus navy seaplanes of various types by public auction. They are in good condition. Seaplanes are in commercial service already between New York and Atlantic City, San Pedro and Santa Catalina, Key West and Habana, and Chicago and Milwaukee.

George White and Co., of Los Angeles, California, the manufacturers of the White seaplane, a monoplane, are going to attempt a flight over the following route:—Los Angeles—Francisco, Victoria (British Columbia), Sitka (Alaska), Petropavlovsk (Kamschatka), Yokohama, Shanghai. This is a total of some 5,780 miles.

Mr. George D. White is also planning to build a 660-h.p. three engined monoplane with which to cross the Pacific Ocean.

He will take the northern route from San Francisco to Shanghai. The journey is estimated to take three days, it now requires three weeks on the fastest boat.

The National Air Service Corporation of America has announced plans for an aerial passenger and freight service on the route New York-Bridgeport-New London-Boston. Two biplanes will be used.

Six large Missouri property-holders have purchased a Curtiss aeroplane for the rapid inspection of their ranches. The properties range in size between three and four thousand acres each.

Two aviation companies are in active business, and a third in the process of organisation in the vicinity of Spokane, Washington.

Over 1,000 radio stations, covering districts in all parts of the United States, have been established by the American Flying Club. Any aviator flying cross-country can always be in touch with any city or town in the United States. The district radio operator can procure assistance to any machine which has an accident or a forced landing in an inaccessible place.

The National Air Service of New York has announced an aeroplane passenger and commercial service between New York and Boston, with intermediate stations at Bridgeport and New London

A SALE OF AERO-ENGINES.

The Aircraft Disposal Department, the Ministry of Munitions, have a job-lot of aero-engines for sale. The engines include Hispano-Suizas, Sunbeams, and Gnomes, and are suitable for spare parts, ball-races, etc.

They can be viewed at the Waddon depot, near Croydon, and tenders are requested. Permits to view and all particulars may be obtained from the Controller, Aircraft Disposal Department, York House, Kingsway, W.C.2.

CONGRATULATIONS.

A practical clip at last!—the "Mark 1" Clip.

NO LEAK at 250lbs. pressure!

At a recent test, the Simko water pipe clip held a joint at over 250lbs. pressure per square inch. This efficiency is due to the powerful contracting action of its stranded wires and prepared webbing. The simplicity of its construction, and the fact that it can be fitted and dissembled indefinitely, clearly show its advantage over ordinary clips.

AIRCRAFT FINANCE

CURRENT TOPICS.

A Step towards Normality.

It stands to reason that the removal of the embargo on international financial movements must straighten out the Industrial position generally. Therefore, the decision is to be welcomed for what it promises to accomplish, and the grumbling at the temporary disturbance, inseparable from the change over, is uncalled for. The Financial World will be all the better for this freedom: it is a question of time.

Whiteheads.

The reminder at the creditors' meeting that Whitehead Aircraft preference and ordinary shares obtain "something" out of the sale of the undertaking has failed to arouse any interest in the shares. The last transaction in the 10 per cent. cumulative and participating £1 ordinary shares was on the basis of 5s. 6d., and in the deferred 1s. shares at 1s. to 1s. 3d. There are possible buyers of large quantities of the former under 5s., which suggests that that will prove to be their real worth under terms to be offered. One cannot wonder at the reluctance of holders to sell; the shares were originally issued at 21s. 6d. each, and the average investor would rather hold on against the chance of getting more of the capital back than cut the loss now.

The Warings Investments in Aircraft.

There has been a slight rally in Waring and Gillow shares, the ordinary to 8s. 6d. and the preference to 13s. 6d., on what was said at the meeting. Some references were made to the subject of aircraft auxiliary. Thus, investments in subsidiary undertaking had increased, it was explained, from £140,112 on Jan. 31st, 1916, to £322,319, owing chiefly to the establishment of the Alliance Aeroplane Co. This was formed to carry out "very important Government contracts and to perpetuate the excellent reputation earned as builders of aeroplanes." At Acton new up-to-date works to carry on ultimately the aeroplane business are being erected, and, meantime, to engage in the manufacture of motor bodies, etc. Every step that human foresight could suggest had been taken to ensure a profitable career for the Alliance Aeroplane Co. For the present year, at any rate, there was sufficient business to make it a profitable undertaking.

Thornycroft's Capital.

John I. Thornycroft and Co., who are concerned principally with shipbuilding but also have interests in Aircraft, propose to increase the capital to £750,000 by the creation of 250,000 7½ per cent. participating preferred ordinary shares of £1 each. An Indian Auxiliary has been established with a capital of £160,000.

NEW COMPANIES.

The Norman Thompson Flight Co., Ltd., aeroplane manufacturers, Bognor, Sussex.

A largely attended meeting of the creditors of the above was held on July 28th at the Institute of Chartered Accountants, Moorgate Street, E.C., when the chair was occupied by Mr. H. J. Morland, of Messrs. Price, Waterhouse and Co., C.A., of 3, Frederick's Place, E.C. The chairman stated that the shareholders of the company had passed a resolution in favour of voluntary liquidation, and he and Mr. W. R. Clemens, of Aldermans House, Bishopsgate, E.C., were appointed to act as the liquidators. A statement of affairs was submitted showing the position as at July 10th last, and this disclosed assets estimated to realise £82,618.

The assets were as follows: cash in hand and at bank £736; bills receivable £350; book debts £51,690; sundries £5,520; expected to produce £2,719; stocks on hand £32,397, estimated to realise £11,623; land at Middleton, £2,914, valued at £500; workshops, etc., £15,273, valued at £7,500; plant and machinery, £12,968; expected to produce £2,500; and equity in new buildings valued at £5,000. No value was placed on the goodwill, which appeared in the books at £1,500. The new buildings were erected at a cost of £21,372, but the Ministry of Munitions were responsible for a third of the cost. The company was liable for £14,248 in connection with the new buildings, and the equity was valued at £5,000.

The assets were subject to preferential claims of £5,021. £34,498 was due on a prior lien and £14,248 was owing in respect of the new buildings. Those three items totalled £54,781, and after allowing for them the assets were reduced to £27,837. The prior lien was due to Messrs. Cox and Co., and that firm also held first Mortgage Debentures on which £32,291 was due. Under a scheme of arrangement previously come to Messrs. Cox and Co. had agreed to take in discharge of those debentures a sum equivalent to three-fourths of the balance of £27,838.

A sum of £20,878 would therefore go to them, which would represent a dividend of 12s. 11d. in the £ on their debentures, leaving £6,959 for distribution to the holders of the second Mortgage Debentures. The amount due to the latter was £50,846, and they would receive a dividend of 2s. 9d. in the £. It was pointed out that the second debenture holders were the old creditors of the company. The claims of the old creditors amounted to £47,962, and a debenture was issued to Mr. E. H. Hawkins, as trustee, on April 18th, 1918. There was interest due to the debenture holders of £2,883. The amount due to the sundry trade creditors was £279, and they would not receive any dividend.

The chairman said that to a considerable extent the figures in the statement of affairs were subject to variation. The liquidators would have to complete some of the work which was in hand.

Mr. Clemens explained the statement in detail and pointed out that the surplus of £27,837 available for distribution amongst the debenture holders was subject to the expenses of the liquidation and the cost of carrying on the business. The situation of the works at Middleton militated against the successful working of the company. The works were some six or seven miles from Bognor and there were practically no transport facilities. With regard to the new buildings they were practically erected at the command of the Government. They had never been used, having only just been completed at the date of the armistice. Owing to the cessation of hostilities there had been a great drop in the value of aeroplane stocks. The company had a large stock on hand which it was feared would not realise well at break-up prices. There was, however, a quantity of timber which should realise well.

Mr. Terry, solicitor, who appeared for one of the largest creditors, said that some time ago Mr. Handley Page offered 3s. in the £ to the creditors, and he understood that that offer was again being put forward. The creditors desired to be represented in the liquidation of the company, and he therefore proposed that an application should be made to the Court for the appointment of Mr. E. H. Hawkins, of Messrs. Poppleton, Appleby and Hawkins, 4, Charterhouse Square, E.C., as joint liquidator of the company. He also proposed that a committee should be appointed consisting of the representatives of Messrs. Joseph Owen and Sons, Ltd., Sellon Ltd., and the Palmer Tyre Co.

Mr. W. H. Cork, who seconded the motion, said he was surprised at the way in which the liquidators had written down the assets. They could not expect possible buyers to make good offers for any of the assets when they had been written down so drastically.

Mr. Houstoun, who supported the motion, said that the principal creditors were called together twelve months ago, and as a result of their efforts the general body of creditors were in a better position. It was as a result of the efforts of the principal creditors that they got a quarter of the amount which went to Messrs. Cox under the debentures held by that firm.

After some discussion the resolution was carried by a very large majority on a show of hands, only two creditors dissenting, and the chairman then announced that it was necessary for the motion to be carried by a majority of the creditors in number and value. A poll would therefore have to be taken.

The representative of Messrs. Cox and Co. said that they were by far the largest creditors and would vote against the resolution, and under the circumstances it could not be carried by a majority of the creditors in value.

It was, however, pointed out that Messrs. Cox and Co. were partly secured creditors and could only vote for the amount for which they were unsecured.

It was stated that the result of the voting would be reported to the Court when the application was made.

West of Scotland Aviation Co., Ltd.—Private company. Registered August 5th. Capital £2,000 in £1 shares. To carry on the business indicated by the title. The subscribers (each with one share) are:—F. W. French, J.P., Stayer House, Eye, Suffolk; Lt. J. Fryer, R.D.C., Kingsthorn, Ashford, Kent. The first directors are T. H. French, F. W. French, R. W. Reeve and J. Fryer. Qualification £100. Secretary, F. W. French. Registered office: Station Road, Eye, Suffolk.

Aerial Photos, Ltd.—Private company. Registered in Edinburgh, July 18th. Capital £18,000 in £1 shares. Objects: to carry on the business of (a) aerial photography, including cinematograph films, (b) aerial passenger transit and (c) commercial aerial advertising, etc. Agreement with Capt. R. S. J. B. Andrews, Major C. H. C. Smith, and Capt. O. Hardie. The subscribers (each with one share) are:—H. E. Haig, Clayton, Dairsie, Fife, papermaker; A. R. Wilson Wood, 7, Abbotsford Crescent, St. Andrews, Fife, gentleman; L. W. Allen, 77, Station Street, Coventry. The first directors are Capt. R. S. J. B. Andrews, C. H. C. Smith, and O. Hardie. Registered office: 81a, George Street, Edinburgh.

AIRCRAFT IN PARLIAMENT

The following written answer was given on August 18th :—

FEMALE CIVILIAN SUBORDINATE.

Major-Gen. SEELY replying to Lieut.-Commdr. Kenworthy said : The number of female civilian subordinates employed by the Royal Air Force (exclusive of the female staff at the Air Ministry) was as follows : January 1st, 1919, 1,823; July 1st, 1919, 2,547; August 1st, 1919, 2,500. This increase has been rendered necessary in order to facilitate the very rapid demobilisation of the Royal Air Force

* * *

The following oral answer was given on August 19th :—

ANTI-AIRCRAFT GUN DEFENCES.

Mr. FORSTER replying to Sir John Butcher said .—The numbers employed in this country in connection with anti aircraft defences on August 11th were : Officers, 273; other ranks, 2,319 The corresponding numbers on November 11th, 1918, were : Officers, 717; other ranks, 11,948. The work of removing the equipment from stations that are no longer required is in progress, and when this is completed the personnel will be further reduced.

* * *

The following written answers were given on August 19th :—

MISS DOUGLAS-PENNANT (INQUIRY).

Sir ROBERT THOMAS asked the Lord Privy Seal whether the Government are prepared, on certain conditions, to take part in the House of Lords Inquiry concerning the dismissal of Miss Douglas-Pennant; if so, whether he will inform this House what those conditions are; and will he state the reasons which have led the Government to take this course after refusing in this House the demand for a judicial inquiry.

Mr. BONAR LAW : The Committee has power to summon witnesses and to ask for papers. I am informed that the Air Ministry will assist the Committee in making any necessary arrangements for the attendance of witnesses, and will produce papers which the Committee wish to have. The Secretary of State has approved the appointment of counsel to represent the Air Ministry before the Committee.

CIVIL AVIATION.

Lieut.-Col. MALONE asked the Under Secretary of State to the Air Ministry whether he can give an assurance that, in taking every step to cut down expenditure and ensure economy in his Department, he will support and strengthen the Department of Civil Aviation in order to assist the development of British aircraft production, the success of which industry will add materially to the general prosperity of the country; and whether he will be prepared to give an account of the progress and work of that Department when Parliament reassembles.

Major-Gen. SEELY : With regard to the first part of the question, I am not at present in a position to add anything to the statement I made when introducing the Estimates, but my hon. and gallant friend may rest assured that the Government are fully alive to the importance of civil aviation to this country. The answer to the second part of the question is in the affirmative.

AERODROMES (TADCASTER AND SHERBURN-IN-ELMET).

Major-Gen. SEELY replying to Major Lane-Fox said :—The staff of officers and other ranks at July 31st, 1919, at the aerodromes referred to in my hon. and gallant friend's question was as follows :—

	Tadcaster	Sherburn-in-Elmet.
R.A.F.—Officers	48	2
Other ranks	159	58
W.R.A.F.—Officers	2	0
Other ranks	66	0
Civilian Subordinates—Male	2	22
Female	2	9
	279	91

Neither of these stations is included in the Royal Air Force post-war programme, but the use of one of them will have to be retained for civil aviation until a more suitable aerodrome, closer to the City of Leeds, has been provided. These aerodromes will shortly be handed over to the Disposal Board for disposal. The cost of construction has been : Tadcaster, £108,000; Sherburn-in-Elmet, £195,000.

ATLANTIC FLIGHT (EXHIBITION OF AEROPLANE).

Major-Gen. SEELY replying to Lieut.-Col Malone said that the Vickers-Vimy aeroplane which flew the Atlantic is the property of a private firm (Vickers Ltd.), and that he had not been informed officially whether the firm wished to part with it, so that it could be placed in the South Kensington Museum with other pioneer examples of locomotion. He was asking his right hon. friend whether he could arrange for the placing of it in the South Kensington or other suitable public museum, if the firm desired to present it to the nation

CIVIL AERODROMES.

The Air Ministry makes the following announcement.

The following lists are issued in order to provide the Aircraft Industry, pilots, and the public with information regarding aerodromes and landing-grounds open to civil aviation, and the location of Service stations which are not available to Civil Aircraft except in case of emergency.

It should be clearly understood that these lists are purely provisional, and are subject to alteration or addition from time to time. Such amendments will be duly published.

In those cases in which it is stated that " accommodation " does not exist, no facilities other than the actual landing-grounds are available. No guarantee can be given at the present time that personnel to handle aircraft is available either at the Service stations or at the privately licensed aerodromes.

The list of aerodromes published on April 25th as being available for Civil Aviation is now cancelled.

The schedule of prohibited areas published in Air Navigation Regulations, 1919, Schedule 6, remains in force for the present, but a revised list, considerably reducing the number of prohibited areas, will be issued shortly.

A map showing the Service stations and aerodromes and prohibited areas will be available shortly, and will be placed on sale to the public so soon as it is ready.

LIST A.

Service Stations Available Only for Civilian Machines in Emergency.

Aerodrome or Seaplane Station.	Nearest Railway Station and Distance in Miles.	Postal Town and Distance in Miles.
ANDOVER	Andover Junction (1½) (L. & S.W.)	Andover (2)
BALDONNEL	Lucan (2) (M.G.W. & G.S. & W. Rlys.)	Lucan (2)
BICESTER	Bicester (2) (G.W.R.)	Bicester (1)
BIRCHAM NEWTON	Docking (4) (G.E.R.)	King's Lynn (14)
BIGGIN HILL	North or South Bromley (5) (S.E. & C.R.)	Bromley (5)
BRACEBRIDGE	Boultham (1) (G.N.R.); Lincoln (3) (G.N.R. & G.E.R.)	Lincoln (2)
BROCKWORTH	Gloucester (4) (G.W.R.)	Gloucester (3½)
(S) CALSHOT	Brockenhurst (12) (L.S.W.R.); Southampton (15)	Southampton (15)
CRANWELL	Caythorpe (4) (G.N.R.)	Grantham (10)
CROYDON (Beddington)	East Croydon (2) (S.E.C.R. & L.B.S.C.R.)	East Croydon (2)
DETLING	Bearstead (2) (S.E.C.R.)	Maidstone (5)
DONIBRISTLE	Inverkeithing Bay (2) (N.B.R.)	Inverkeithing (2)
(S) DOVER (Marine Parade)	Dover Harbour (¾) (S.E.C.R.)	Dover
DOVER (Swingate Downs)	Dover Town (2) (S.E.C.R.)	Dover (2)
DUXFORD	Whittlesford (2) (G.E.R.)	Cambridge (12)
EASTCHURCH	Queenborough (5) (S.E.C.R.)	Queenborough (5)
FARNBOROUGH	Farnborough (2) (L.S.W.R.)	Farnborough (2)
FLOWER DOWN	Winchester (3) (L.S.W.R. & G.W.)	Winchester (3)
FORD JUNCTION	Ford Junction (1) (L.B.S.C.)	Arundel (5)
FOWLMERE	Royston (5) (G.E.R.)	Royston (4)
FRIESTON	Boston (5) (G.N.R.)	Boston (5)
GOSPORT	Fort Blockhouse (L.S.W.R.) (close at hand)	Gosport (½)
(A & S) GRAIN	Port Victoria (¼) (S.E.C.R.)	Sheerness (1¼)
HALTON	Wendover (1) (G.W.R.)	Aylesbury (5)
HARLAXTON	Grantham (4) (G.N.R.)	Grantham (4)
HAWKINGE	Folkestone (2½) (S.E.C.R.)	Folkestone (2½)
HENLOW	Henlow adjoining (M.R.)	Bedford (11)
KINGSNORTH	Beluncle Halt (S.E.C.R.)	Chatham (4)
LARKHILL	Amesbury (6)	Salisbury (12)
(S) LEE-ON-SOLENT	Lee-on-Solent (¼) (L.S.W.R.)	Southampton (11)
LEUCHARS	Leuchars Junction (½) (N.B.R.)	St. Andrews (5)
(x) MANSTON	Minster (1) (S.E.C.R.)	Ramsgate (3)
MARSKE	Marske (1) (N.E.R.)	Whitby (18)
MARTLESHAM HEATH	Bealings (1) (G.E.R.) Woodbridge (4) (G.E.R.)	Ipswich (6)
NETHERAVON	Bulford (5) (L.S.W.R.)	Salisbury (13)
NORTH WEALD BASSETT	North Weald Bassett (½) (G.E.R.)	Epping (2)
OLD SARUM	Salisbury (4) (L.S.W.R.)	Salisbury (4)
ORFORDNESS	Woodbridge (12) (G.E.R.)	Felixstowe (15)
(S) PORTLAND	Portland (300 yds.) (L.S.W.R.)	Weymouth (4)
SCAMPTON	Lincoln (5) (G.E.R., G.N.R., G.C.R.)	Lincoln (6)

List A (continued).

Scopwick	Scopwick (4) (G.N.R., G.E.R.)	Sleaford (9)
Shrewsbury	Shrewsbury (1½) (G.W.R.)	Shrewsbury (1½)
Smoogroo	Thurso (thence by boat) (G.N. of S.R.)	Kirkwall (8)
South Carlton	Lincoln (4) (G.E.R., M.R., G.C.R., G.N.R.)	Lincoln (3)
Spittlegate	Grantham (2) (G.N.R.)	Grantham (2)
Stonehenge	Amesbury (4); Salisbury (9) (L.S.W.R.)	Salisbury (8)
Sutton's Farm	Hornchurch (¾) (L.T. & S.)	Romford (5)
Tangmere	Drayton (1) (L.B.S.C.R.)	Chichester (4)
(S) Tresco	Penzance (thence by boat) (G.W.R.)	St. Mary's (2)
Upavon	Pewsey (5) (G.W.R.)	Salisbury (15)
Weston-on-the-Green	Bicester (6) (G.W.R.)	Bicester (4)
Worthy Down	Winchester (3) (L.S.W.R., G.W.R.)	Winchester (4)
Yate	Yate (1) (M.R.)	Bristol (9)

Notes.—(S) Seaplanes only. (A & S) Aeroplanes and Seaplanes. (x) Not available for civil use after 1919.

LIST B.

Service Stations also Available for Civil Use.

Aerodrome or Seaplane Station.	Nearest Railway Station and Distance in Miles.	Postal Town and Distance in Miles.
Castle Bromwich	Castle Bromwich (5) (M.R.)	Castle Bromwich (5)
Coal Aston	Beauchief (2½) (M.R.)	Sheffield (3)
(S) Dundee	Stannergate (¾) (N.B.R.)	Dundee (2)
Eastleigh	Eastleigh (1½) (L.S.W.R.)	Eastleigh (1½)
(S) Felixstowe	Felixstowe (G.E.R.)	Felixstowe (2)
Kenley	Upper Warlingham (1) (L.B.S.C.)	Kenley
(x) Manston	Minster (1) (S.E.C.R.)	Ramsgate (3)
Luce Bay	Stranraer (5) (G.S.W.R.)	Stranraer (5)
Pembroke	Pembroke (5) (G.W.R.)	Pembroke (4)
Renfrew	Fultar Street (1) (N.B.R.)	Glasgow (5)
Sherburn-in-Elmet	Sherburn-in-Elmet (1) (G.N.R.)	Selby (6)
Shotwick	Queensferry (1) (L.N.W.R.)	Chester (6)

Note.—(S) Seaplanes only. (x) Included in B List during 1919 only.

LIST C.

Stations Temporarily Retained for Service Purposes, but also Available for Civil Use.

Aerodrome or Seaplane Station.	Nearest Railway Station and Distance in Miles.	Postal Town and Distance in Miles
Aldergrove	Aldergrove (1) (G.N.R.)	Antrim (4)
(A & S) Brough	Brough (¼) (N.E.R.)	Hull (12)
Didsbury	Didsbury (1) (M.R.)	Manchester (3)
Filton	Filton (1) (G.W.R.)	Bristol (5)
Hendon	Hendon (1) (M.R.)	Hendon (1)
Hucknall	Hucknall (1) (G.C.R.)	Nottingham (6)
Lympne	Westonhanger (1) (S.E.C.R.)	Hythe (4)
Montrose	Montrose (1) (N.B.R.)	Montrose (2)
Newcastle (Town Moor)	West Jesmond (½) (N.E.R.)	Newcastle-on-Tyne (2)
Tallaght	Dublin (7) (G.S. & W.R.)	Dublin (7)
Turnhouse	Turnhouse (1) (N.B.R.)	Edinburgh (6)

Note.—(A & S) Aeroplanes and Seaplanes.

LIST D.

Civil Aerodromes Already Licensed.

(*a*) Aerodromes at which accommodation exists.

Aerodrome.	Nearest Railway Station and Distance in Miles.	Postal Town and Distance in Miles
(x) Hounslow	Hounslow Junction (1) (L.S.W.R.)	Hounslow (2)
Bournemouth	Bournemouth (3) (Central) (L.S.W.R.)	Bournemouth (3)
Cricklewood	Cricklewood (½) (M.R.)	Cricklewood (½)
Cheltenham	Churchdown (2) (M.R.)	Cheltenham (4)
Feltham	Feltham (½) (L.S.W.R.)	Feltham (½)
Kingsbury	Hendon (½) (M.R.)	Hendon (1)
Stag Lane	Edgware (½) (M.R.)	Edgware (½)
Southport (Sands)	Hesketh Park (¾) L. & Y.)	Southport (1)

Note.—(x) Government-owned, London terminus.

(*b*) Aerodromes licensed as suitable only "for Avro 504K and other similar types of aircraft." Except in a very few instances, accommodation does not exist. The licences have also been issued for limited periods only.

Aerodrome.	Nearest Railway Station and Distance in Miles.	Postal Town and Distance in Miles.
Blackpool (Squire's Gate)	Waterloo Road, Blackpool (2½) (L.N.W.R.)	Blackpool (2½)
Brean Down (Weston-super-Mare)	Bleadon and Uphill (1¼) (G.W.R.)	Weston-super-Mare (2)
(x) Burgh Castle	Belton (1) (G.E.R.)	Belton (1)
Cardiff (Ely Racecourse)	Ely Station (½) (G.W.R.)	Cardiff (1)
Chichester	Chichester (1½) (L.B.S.C.R.)	Chichester (1½)
Hardwick (near Cambridge)	Lords Bridge (3) (G.E.R.)	Cambridge (6)
Ladies' Mile (Brighton)	Preston Park (3) (L.B.S.C.R.)	Brighton (3)
Llanwrytd Wells	Llanwrytd Wells (½)) (L.N.W.R.)	Llanwrytd Wells, Breconshire (½)
Manstone (near R.A.F. Aerodrome)	Minster (1) (S.E.C.R.)	Ramsgate (3)
Porthcawl	Porthcawl (1) (G.W.R.)	Bridgend (5)
Preston	Preston (1½) (L.N.W.R.)	Preston (1)
Scarborough	Scarborough (1½) (N.E.R.)	Scarborough (1)
Southsea	East Southsea (½) (L.S.W.R.)	Southsea (¼)
(x) Stray (Harrogate)	Harrogate (½) (N.E.R.)	Harrogate (½)
Sunderland	Monkwearmouth (1) (N.E.R.)	Sunderland (1½)
	Situated on Sands—i.e., Not Available at High Tide.	
Blackpool	Waterloo Road (½) (L.N.W.R.)	Blackpool (1½)
Douglas (Isle of Man)	Douglas (¼) (Isle of Man)	Douglas (½)
Fleetwood	Fleetwood (½) (L.N.W.R.)	Fleetwood (¼)
Morecambe Bay	Morecambe (½) (L.N.W.R.)	Morecambe (1)
Rhyl	Rhyl (½) (L.N.W.R.)	Rhyl (½)
St. Andrews	St. Andrews (¼) (N.B.R.)	St. Andrews (½)
Waterloo-with-Seaforth	Bootle (1) (L. & Y.)	Bootle (1)

Note.—(x) Licensed for all but larger types of aircraft.

NAVAL & MILITARY AERONAUTICS

NAVAL.

Admiralty Appointments and Promotions.

The following promotion has been made :—
Aug. 21st.—Engr. Lieut. (Temp. Capt., R.A.F.).—R. G. Parry, D.S.O., to rank of Engr. Lieut.-Commdr., seny. Aug. 1st.
The following appointments have been made :—
Aug. 19th.—Sub-Lieut.—C. F. B. Arthur, to "Furious," Aug. 18th.
Aug. 23rd.—Artfr Engrs.—F. H. Causfield, to "Argus," Aug. 22nd.

It is now stated that in the recent Naval action off Kronstadt, when some British C.M.Bs. sank two Bolshevik battleships and a destroyer, the C.M.Bs. were accompanied by three aeroplanes. No mention of aircraft was made in the official communiqué on the subject.

On Aug. 18th British aeroplanes, supported by some C.M.Bs., attacked the fortress of Kronstadt. One of the aeroplanes was forced to descend at the Styrsudd Lighthouse. The pilot was unhurt.

* * *

Mr. John Pollock, the "Daily Mail" correspondent, writes of the Kronstadt affair of Aug. 18th :—

"The attack was opened on Monday afternoon by aeroplanes, which dropped incendiary bombs on the harbour and photographed the positions. The entire attention of Kronstadt was concentrated on the attack from the air. All the batteries and search-lights were directed against the flying peril; but the aeroplanes' assault was merely a blind. The airmen wirelessed to the Fleet, giving the exact positions of the ships in the harbour.

"At 2 a.m. on Tuesday four British high-speed motor-boats approached the harbour. The attack with aeroplane help met with extreme success, and was carried out to the minute, the object being to deliver a blow at all points simultaneously."

* * *

To commemorate the work done during the war by the Metropolitan Observation Service, under Comdr. Paget, it is the intention of the members of this corps to endow a cot in the new Children's Ward at the Charing Cross Hospital. Donations may be sent to the hospital. £276 3s. 6d. has already been subscribed. This corps was formed to give information of the presence and position of hostile aircraft.

MILITARY.

From the "London Gazette."

War Office, August 18th.

Regular Forces.—Infantry.—4th Bn. Gord Highrs.—Sec. Lt. J. W. Mennie (Lt., R.A.F.) to be Lt., and to remain secd., Sept. 28th, 1918.
Oversea Forces.—Canada.—Can. Forestry Corps.—Temp. Lt. H. E. Rosborough ceases to be secd. for duty with the R.A.F., June 4th (substituted for "Gazette" notification, March 14th, page 3465).

War Office, August 19th.

Regular Forces.—Royal Army Chaplains Department.—The Rev. R. N. O'Shaughnessy, temp. Chapln. to the Forces, relinquishes his comm. on transfer to the R.A.F., Aug. 1st
Oversea Forces.—Canada.—Commands and Staff.—Memorandum.—Temp. Capt. D. R. MacLaren, D.S.O., M.C., D.F.C. (Br. Columbia R.). to be actg. Maj., and to remain secd. whilst empld. as Liaison Officer, vice temp. Capt. (actg. Maj.) F. A. Landry, May 16th.

War Office, August 20th.

Regular Forces.—R.A.F.—Mil. Wing.—The following appointment is made :—Flying Officer.—Temp. Sec. Lt. (on prob.) N. A. Meintjes, Gen List, and to be confirmed in his rank, Oct. 14th, 1917.
Infantry.—Yorks L. I.—R. D. H. Draper (temp. Lt., R.A.F.) to be temp. Lt., Dec. 20th, 1918, seny. May 22nd, 1918.

War Office, August 21st.

Regular Forces.—Rif. Brig.—To be Lt.-Col.—Maj. and Lt. Lt.-Col. W. W. Seymour, vice Lt.-Col. (temp. Brig.-Gen., R.A.F.) B. H. H. Cooke, C.M.G., C.B.E., D.S.O., who is removed from Regtl. List, Aug. 22nd.

War Office, August 22nd.

Regular Forces.—Oversea Forces.—Canada.—Can. Engrs.—The following retire in the British Isles :—Temp. Lt. (actg. Capt.) J. F. D. Tanqueray, D.F.C., Aug. 12th; Temp. Lt. (actg. Capt.) J. F. D. Tanqueray, D.F.C., ceases to be secd. for duty with the R.A.F., Aug. 6th.
Westn. Ontario R.—Temp. Lt. F. L. Baker ceases to be secd. for duty with the R.A.F., June 13th (substituted for "Gazette" notification June 28th, page 8197, incorrectly specifying date as April 25th).
Manitoba R.—Temp. Lt. C. R. Gross ceases to be secd. for duty with the R.A.F., Aug. 8th.
Saskatchewan R.—Temp. Lt. L. A. Smith ceases to be secd. for duty with the C.A.F. as Lt., Flying, March 31st.
Alberta R.—Temp. Lt. A. Rose, M.M., ceases to be secd. for duty with the R.A.F., July 20th.
Infantry.—9th Bn. Hamp. R.—Sec. Lt. A. F. Harris (Sec. Lt., R.A.F.) to be Lt., and to remain secd., March 1st.

War Office, August 23rd.

Staff for R.E. Services.—Temp. I.O.W. and Capt. T. Ridge relinquishes his commn. on transfer to the R.A.F., Sept. 26th, 1918
Territorial Forces.—General List.—Qrmr. and Capt. A. E. Brooks resigns his commn. on transfer to the R.A.F., May 27th, 1918.

Official Communiqués.

The following communiqué was issued at Simla on August 18th :—
An aeroplane bombed the gang of Sulciman Khel Wazirs which raided a post on August 9th, inflicting 30 to 40 casualties.
The following communique was issued at Simla on Aug. 19th :—
An aerial reconnaissance from Fort Sandeman on the 17th inst. saw no hostile gatherings

---

It has been brought to light during the compilation of the official aerial history of the war, that several R.F.C. Squadron Record Books, which are of great value for historical purposes, are missing.

The Air Ministry requests that any such books as may be in the possession of demobilised officers or others should be returned, at once, to the Officer in Charge, Air History Branch, Offices of the War Cabinet, 2, Whitehall Gardens, S.W.

AIR FORCE.

From the "London Gazette."

Air Ministry, August 19th.

R.A.F.—Permanent Officers.—Promotions.—Air Vice-Marshal Sir Hugh Montagu Trenchard, Bart., K.C.B., D.S.O., to be Air Marshal, Aug. 11th.
The following temp. appointments are made at the Air Ministry :—Staff Officer, 1st Class (Air).—Lt.-Col. J. A. Chamier, C.M.G., D.S.O., O.B.E., Aug. 1st.
Staff Officer, 2nd Class (Air).—Maj. B. E. Sutton, D.S.O., O.B.E., M.C., July 31st, vice Capt. W. A. A. Chauncy.
Staff Officer, 3rd Class (Air).—Capt. W. A. A. Chauncy, from (S.O.2), July 31st.
The following temp. appointments are made :—Staff Officers, 1st Class (P.)—Lt.-Col. C. T. MacLean, D.S.O., M.C., Aug 15th. (T.)—Maj. A. Levick, from (S.O.2), Aug. 2nd.

Conferred by the President of the French Republic.

Legion d'Honneur, Officier.—Maj.-Gen. Sir F. H. Sykes, K.C.B., C.M.G. (Ret. List).

Legion d'Honneur, Chevalier.—Lt.-Col. G. W. F. Fraser, O.B.E.; Capt. (actg. Maj.) G. Gude, O.B.E.; Maj. C. A. L. Harrison, O.B.E.; Capt. L. E. Innes-Baillie (R.M.L.I.).

Croix de Guerre, avec Palme.—Capt. (actg. Maj.) E. J. Briscoe, O.B.E.; Capt. C. B. Dalison, A.F.C.; Lt.-Col. R. B. Davies, V.C., D.S.O.; Maj. C. Draper, D.S.O.; Capt. W. L. Elder, C.M.G., R.N. (formerly R.N.A.S.); Lt. W. J. Gillespie (41st Sqdn.); Capt. J. A. Glen, D.S.C.; Maj. H. P. L. Higman, D.F.C.; Lt. J. D. Newberry (deceased); Capt. L. V. Pearkes; Lt. E. C. Potter; Wt. Offr., Cl. II. (now Sec. Lt.) J. Rees.

Croix de Guerre, avec Etoile, en Vermeil.—245207 Serjt.-Mech. J. P. Hazell (107th Sqdn.).

Medialle d'Honneur avec Glaives, en Argent.—216604 Serjt. Obsr. W. J. Middleton, D.F.M.

Medialle d'Honneur avec Glaives, en Bronze.—25970 Pte. A. Weickers; 8259 A./Mil. C. H. Cobden.

Conferred by the King of Italy.

Officer of the Order of St. Maurice and St. Lazarus.—Lt.-Col. (actg. Brig.-Gen.) R. H. More, C.M.G., C.B.E.

Cavalier of the Order of St. Maurice and St. Lazarus.—Maj. A. McAlister, Lt. L. F. de Peyrecave.

Cavalier of the Order of the Crown of Italy.—Maj. R. P. Whitehead.

Conferred by the King of the Belgians.

Medialle de la Reine Elizabeth.—Asst. Admtr. Miss M. S. Cole-Hamilton, W.R.A.F.

Conferred by the King of Rumania.

Officer of the Order of the Crown, with Swords, and Knight of the Star of Rumania, with Swords.—Capt. (actg. Maj.) F. S. Moller, M.C., D.F.C.

Conferred by the Bey of Tunis.
(For Services at Bizerta.

The Order of Nichan Iftikhar, Third Class.—Lt. F. H. Bell (Flying Officer); Lt. A. V. Gash; Lt. A. Smith (Flying Officer).

Order of Nichan Iftikhar, Chevalier, Classe I.—209246 L.A.C. Blight (St. Austell); 208551 A./C.1 G. C. Crane (Stratford); 206142 L.A.C. F. Coward (Ventnor); 211479 L.A.C. S. Reeve (Norfolk); 209464 L.A.C. A. F. Mason (Newmarket); 206403 L.A.C. E. Thompson (Wimbledon).

Correction.

Maj. James Percy Carre Cooper, O.B.E., M.C. (10th Bde., France) is the correct description of the officer awarded the Star of Roumania, Officier, in "Gazette," July 15th, 1919.

As a considerable number of officers and other ranks of the Royal Air Force have been awarded a foreign decoration during the war, and have not yet received the insignia, a list of such cases is being compiled by the Air Ministry with a view to the decorations being obtained.

Officers and other ranks concerned (a) who have now been released from the Service, or (b) who are not serving either abroad or in the area commands at home, are accordingly requested to communicate with the Secretary, Air Ministry, quoting A.M.W.O. 946, and giving the following particulars :—Air Force number; rank; full Christian name and surname; designation of decoration not received; date (approx.) of "Gazette" in which notification of award was made; and full postal address.

Pilots of aircraft are warned by the Air Ministry that kite-balloons will be flown from time to time for purposes of meteorological observation at the following places:—Merifield (Tor Point); Larkhill (Salisbury); Caldafe (Orkneys); North Queensferry (near Edinburgh).

The cables of these balloons when flying will be marked by streamers at intervals of not more than 500 ft.

* * *

It is notified by the Air Ministry that in the event of R.A.F. officers on duty landing at aerodromes not owned by the Government, the aerodrome authorities, having charges to be paid, should render a bill to the Officer Commanding the Unit to which the officers belong. Officers have been instructed to sign a receipt for services obtained in these circumstances.

The Air Ministry announces that the aerodrome at Guston Road (Dover), and the landing ground at New Holland (Yorks), are being relinquished by the R.A.F.

* * *

In future, visitors to R.A.F. aerodromes must first obtain permits from the Air Ministry.

Requests for permits should be addressed to the Secretary, Air Ministry, and should state clearly the purpose for which a permit is required. The permits, if granted, will be issued subject to such restrictions as the Air Ministry may direct.

* * *

It is announced by the Air Ministry that Sir H. H. Shephard, father of the late Brig.-General G. S. Shephard, D.S.O., M.C., R.A.F., has, in memory of his son, placed a sum of money in trust, the income of which is to be applied to the provision of annual prizes for essays by Officers, N.C.Os., and Men of the R.A.F.

The subjects for the essays will concern the airman's work in the air, and this year separate prizes will be given for essays on (1) Sea and Fleet Reconnaissance, and (2) Aerial Navigation and Pilotage.

The administration of the yearly competitions will be carried out by the Air Council.

* * *

The Danish correspondent of The Aeroplane writes:—

A British flying officer has passed Bergen en route for Spitzbergen. He will be stationed there with an air mechanic.

* * *

A British aeroplane operating with the forces of General Denikin was recently brought down at Tcherny, on the Volga, South-East of Tsaritsin. Another British aeroplane, which was returning to the British lines with a punctured petrol-tank, seeing the aeroplane land and noticing the approach of enemy troops, also landed and opened fire on the Bolsheviks with its machine-gun while the pilot and observer of the first aeroplane set light to their machine. They then boarded the second aeroplane, which contrived to ascend, and returned to the British lines.

The observer, by standing on the right wing of the aeroplane, largely saved the situation by plugging the hole in the petrol tank with his finger.

* * *

An air station is being established at St. Raphael (Var), and has been placed under the command of Sqdn. Leader A. S. MacLaren, R.A.F. This station, which is situated near to the French Naval Air Station at Frejus, will form an important landing-ground on the England-India aerial route. It is stated that Flt. Lt. Berwick, R.A.F., is the second in command.

Three flying-boats arrived at St. Raphael on Aug. 18th on their way to India from England.

Another British aeroplane (Lieut. Halliwell, R.A.F.) arrived on August 25th on his way to India.

* * *

The construction of big rigid airships appears to have been stopped by the authorities. Short Bros. have three ships under construction and are stopping work on one.

* * *

No. 1 Aircraft Constructional Wing at Camden Road has developed very greatly. It is fortunate in having the personal interest of officers of the highest rank in the Air Ministry, who do everything they can for the furtherance of the scheme. Two of these officers are Air Marshal Sir Hugh Trenchard, K.C.B., D.S.O., and Group Captain Philip Game, C.B., C.M.G., D.S.O.

On July 23rd the Mayor of St. Pancras received the Military and Air Attachés of the Belgian Legation at the Headquarters, and among those present were the Right Hon. Lord Rothschild, F.R.S., Brig.-Gen. Lord Montague of Beaulieu, C.S.I., Sir Horace Byers, K.C.M.G., and Col. L. Rees, V.C., D.S.O., M.C.

On July 26th a guard of honour of the Wing turned out to welcome General Corvisart (the French Military Attaché), Captain Finsi (the Italian Air Attaché), the French Air Attaché, and representatives of the Esthonian Army, the Military Mission, and the Russian War Office.

Major F. G. Moore, T.F.A., the Officer Commanding this Wing, is the Chief Technical Inspecting Officer for the County of London, and has been lucky in getting as his second in command Major C. W. F. Morgan, of the Martinsyde firm. There is now a complete staff of 28 officers who instruct the cadets in rigging, engines, gunnery, etc. In September classes will be held every night except Saturdays.

As mentioned in a previous issue of The Aeroplane, the Air Ministry have given to the Wing many drawings and small parts, and many big aircraft firms have given aeroplanes and engines. If only there were more accommodation at the Wing, advantage could be taken of the offers of these firms to give and lend more aeroplane parts, etc. The Marconi Company have supplied a complete wireless telephony and telegraphy set with a range of 600 miles which is to be erected over the headquarters

On Aug. 2nd some 200 cadets went down to Eastbourne for a week. They were housed in the huts on the aerodrome, and were given practical instruction on the aeroplanes and seaplanes there. At present they are enjoying a month's leave, until the classes start again in September.

Great attention is given to games, and later on a football club will be run on Service battalion lines by the cadets themselves.

A second Aircraft Construction Wing is being formed in Hackney, affiliated to the 10th London Regiment (Hackney Rifles). Major Moore states that before Christmas five or six more Aircraft Wings will be in existence in various parts of London.

On leaving the Wing the cadets, many of whom worked during the war in aircraft factories in N. and N.W. London, are free to join the R.A.F., an aircraft firm, or anything they please. The wireless set will doubtless make many keen to become wireless operators at sea or on land for the Marconi Company.

In the second week in September another function is taking place at which those interested in the scheme at the Air Ministry, and many leading men in the Aircraft Industry will be present. The work will then be carried out on a far bigger scale than hitherto.

A scheme having so many men high up in the Aeronautical World interested in it, and having attained so much since its official opening by Major-Gen. Trenchard on June 20th, must continue to grow until Aircraft Constructional Wings are in operation all over the country.—G. L. O.

* * *

On Aug. 21st the Royal Air Force held their annual athletic meeting at Stamford Bridge. The King's Cup was won by the South-Western Area after keen competition, the Midland Area running them very close. This Cup is given to the Area with the greatest number of points.

Three Mile Race.—Capt. Irwine (Northern Area), 1; Serjt. C. I. Clibbon (Halton), 2; A./C. Pratt (S.E. Area), 3; Capt. Austin (R.A.F., Rhine), 4. Won by a yard. Time, 15 min. 15 3-5 sec.

W.R.A.F. Relay Race (440 yards).—S.-W. Area, 1; Halton, 2; Northern Area, 3. Won by eight yards. Time, 57 1-5 sec.

440 Yards Race.—Capt. A. P. Mitchell (Halton), 1; Cpl. Bosberry (R.A.F., Rhine), 2; Serjt. Poigndestre (S.-E. Area), 3; Lieut. Jones (R.A.F., Rhine), 4. Won by 12 yards. Time, 51 4-5 sec.

One Mile Race (open to members of Imperial Allied Forces).—Lieut. R. D. Chalmers (A.I.F.), 1; Drvr. W. G. Battersbie (R.F.A.), 2; H./C. H. Ashby (late R.A.F.), 3; Serjt. R. H. Geary (R.A.F.), 4. Won by 20 yards. Time, 4 min. 51 1-5 sec.

880 Yards Race (open to former members of the R.A.F.).—Cpl. P. A. Beard, 1; Cadet J. Noble, 2. Won by 10 yards. Time, 2 min. 9 4-5 sec.

One Mile Race (R.A.F.).—Capt. Gibbs (Midland Area), 1; A./C. Nix (S.-W. Area), 2; Flight Serjt. Darlington, 3. Won by 15 yards. Time, 4 min. 34 1-5 sec.

100 Yards Race.—Serjt.-Maj. Mawby (Midland Area), 1; Serjt.-Maj. Kressler (Northern Area), 2; Cpl. Bosberry (R.A.F., Rhine), 3. Won by half a yard. Time, 10 3-5 sec

880 Yards Race.—Flying Officer Shaw (S.-W. Area), 1; A./M. Morris (Midland Area), 2; Lieut. Catchpole (Northern Area), 3. Won by 10 yards. Time, 2 min. 3 2-5 sec.

120 Yards Hurdles.—Flying Officer Fraser (S.-W. Area), 1; Flight Lieut. Scott (S.-W. Area), 2; Lieut. Bellin (R.A.F., Rhine), 3 Won by five yards. Time, 17 1-5 sec.

880 Yards Race (for Enlisted Boys).—Snaith (Northern Area), 1; T. Weatherall (S.-E. Area), 2; Fox (Midland Area), 3. Won by six yards. Time, 2 min. 9 1-5 sec.

220 Yards Race.—Serjt.-Maj. Mawby (Midland Area), 1; Capt. A. P. Mitchell (Halton), 2; Serjt. Clarkson (Midland Area), 3. Won by three yards. Time, 23 1-5 sec.

100 Yards Race (Imperial and Allied Forces).—Serjt. Wilson (New Zealand), 1; Drvr. L. J. Hume (Australia), 2; Lieut. N. V. Webbe, 3. Won by a yard, after a dead-heat. Time, 10 3-5 sec.

Tug-of-War.—Midland Area beat R.A.F., Rhine, by two pulls to none.

High Jump.—Lieut. F. C. Penny (Irish Group) and Serjt.-Maj. Miller (Midland Area), tied at 5 ft. 7 in. for first place; Lieut. Walmsley (Midland Area), 5 ft. 3 in., 3.

Putting the Weight.—Serjt.-Maj. Mawby (Midland Area), 32 ft. 3 in., 1; Lieut. Fish (Midland Area), 32 ft., 2; Capt. Jones (Northern Area), 31 ft. 8½ in., 3.

Long Jump.—Flying Officer Fraser (S.-W. Area), 21 ft. 4¾ in., 1; Flight Lieut. Lieut. Scott (S.-W. Area), 20 ft. 7 in., 2; Maj. Saul (R.A.F., Rhine), 20 ft. 6¼ in., 3.

One Mile Relay Race.—South-Western Area, 1; Northern Area, 2. Won by 12 yards. Time, 3 min. 47 1-5 sec.

Composite Relay Race (Field Officer, Officer, Warrant Officer, N.C.O., or Man, each to run 100 yards; W.R.A.F. to run 40 yards).—Midland Area, 1; Northern Area, 2; R.A.F., Rhine, 3; South-Eastern Area, 4. Won by six yards. Time, 49 4-5 sec.

FRANCE.

It is announced Lieut. de Vaisseau Sablé has been appointed Air Attaché to the French Embassy in London.

GERMANY.

On Aug. 18th a German aviator bombed Sosnowice, Poland. Several people, including some civilians, were killed. The Polish Government ordered its Mission in Berlin to make a protest and to demand satisfaction from the German Government. The Note was handed in on Aug. 20th.

The following is an extract from the Memoirs of General Ludendorff which have been recently the subject of some four articles in the "Times" newspaper:—

"The battle cost me a great deal also. My wife's youngest son fell on the 23rd. He was a flying officer, and was at first reported missing. On the battlefield we found a grave with the English inscription, 'Here rest two German flying officers.' I had the sad task of identifying my son. Now he rests in German soil. The war has spared me nothing."

A message from Dortmund states that Lieut. Bongartz crashed from a height of about 150 ft. during an exhibition flight at Neheim. His condition is said to be hopeless. Lieut. Bongartz brought down 39 Allied machines during the war, and was brought down by a British aviator in May, 1918.

The Danish correspondent of THE AEROPLANE writes:—

A Commission to control and represent German flying sport has been formed after negotiations with the Government Air Ministry. The President is Major von Tschudi, the former manager of the Johannisthal aerodrome. Lieut.-Col. Siegert, who was the second in command of the German Air Forces during the war, is on the Committee.

ITALY.

On Aug. 23rd four Italian military aviators were killed at the Aspern Aerodrome, near Vienna, owing to their machine crashing.

SWEDEN.

A correspondent in Sweden writes that the first German machine for the Swedish Air Force has arrived in Sweden.

RUSSIA.

OFFICIAL COMMUNIQUÉ (BOLSHEVIK).

AUG. 19TH.—A flotilla of fast enemy ships having broken into Kronstadt Harbour, our guard ships sank three of them by artillery fire. At the same time a considerable number of enemy aeroplanes made an attack on Kronstadt.

* * *

On Aug. 18th the Bolshevik Forces carried out what is claimed to be a retaliatory air-raid upon Teri Joki. It is stated that this raid was a reprisal for the sinking of the Bolshevik warships by the British. No casualties were caused.

U.S.A.

It is understood that the U.S. Navy are entering N.C.4 (Lt. Cmdr. A. C. Read) for the trans-Pacific Competition. The prize is again £10,000, and there is again two alternative routes, and once again Lt. Cmdr. Read will probably take the Southern route, which means refuelling at sea, so that history may be given another opportunity of repeating itself.

* * *

The two U.S. Army aviators, Lieuts. Petersen and Davis, whose capture by Mexican bandits has been already reported, returned to the States under the escort of a Capt. Matlock, U.S. Cavalry, who had successfully paid but half the ransom money to the bandits. These latter are now being pursued by U.S. Cavalry and aeroplanes, but hitherto have, despite the pursuers' advantages, managed to get away.

A flying base for this expedition has been established at Presidio.

It was announced later that Jesus Renteria, the leader of the bandits, was shot from an aeroplane during a skirmish between the American troops and the bandits. The U.S. troops returned to the States on August 24th.

PERSONAL NOTICES.

NAVAL.

ENGAGEMENT.

ELLWOOD—MATTHEWS.—The engagement is announced between Capt. Aubrey B. Ellwood, D.S.C., R.A.F., youngest son of the Rev. C. E. and Mrs. Ellwood, Cottesmore Rectory, Oakham, and Lesley Mary Joan, daughter of Mr. and Mrs. W. P. Matthews, The Old House, Walmer, Kent.

MILITARY.

BIRTHS.

O'BRIEN.—On Aug. 16th, 1919, at Nakuru, British East Africa, the wife of Maj. A. K. O'Brien, late Queen's Bays and R.A.F., of Mtaragon, Lumbwa, British East Africa, of a son.

HEAD.—On Aug. 17th, to Peggy, (nee Grant), wife of Lieut. I. Laurence Head, Royal Sussex Regt. and R.A.F., a son.

AIR FORCE.

MARRIAGES.

HALL-SMITH—HUTCHINSON.—On May 13th, 1919, at St. George's Church, Hanover Square, London, Lieut. Philip Hall-Smith, R.A.F. (since killed), eldest son of the Reverend Philip Merton Smith, of Vancouver, British Columbia, was married to Marjorie Emma Hutchinson, widow of Capt. J. S. Hutchinson, 2nd South Lancashire Regiment, and daughter of Frederick Wrigley, Esq., of Broadoaks, Bury, Lancashire, by the Rector.

OMMANNEY—CHAMBERS.—The marriage took place on July 15th, at Brompton Parish Church, of Major Patrick Gream Nelson Ommanney, R.A.F., younger son of Admiral Sir Nelson and Lady Ommanney, and Miss Pansy Nina Grace Chambers, daughter of Major Grahame Chambers, R.A.F. Prebendary Gough performed the ceremony.

POLLARD—CHEETHAM.—On July 31st, 1919, at St. Martin's Church, Brighouse, Capt. George Reginald Pollard, R.A.F., youngest son of Sir George H. Pollard and Lady Pollard, "Sundown," Southport, was married to Sarah Dorothy, youngest daughter of Mr. and Mrs. John A. Cheetham, "Oaklands," Brighouse, by the Rev. Canon Hone, Vicar.

SANDERS—SPROT.—On July 23rd, at St. Baldred's, North Berwick, Capt. Denis C. W. Sanders, A.F.C., R.A.F., eldest son of Dr. and Mrs. Gordon Sanders, Villa Martha, Cannes, France, was married to Nancy M. G., widow of the late Ivan B. Sprot, Lieutenant, 1st Bn. The Queen's Own Cameron Highlanders, and daughter of Sir George and Lady Berry, Drumsheugh Gardens, Edinburgh, and King's Knoll, North Berwick, by the Right Rev. the Lord Bishop of St. Andrews, assisted by the Rev. T. A. Hughes, M.A., Rector.

SNOW—COLWELL.—On July 29th, at St. Jude's, Southsea, Capt. C. C. Snow, D.F.C., R.A.F., only son of Mr. and Mrs. C. Snow, South Kirkby, Wakefield, was married to Gladys Burton, eldest daughter of the late General Colwell, C.B., Royal Marines, and Mrs. Colwell, Claremont Lodge, Southsea, by the Rev. C. E. Matthews, C.F., the Right Rev. Bishop Ingham, D.D., Vicar, and the Rev. W. R. Musselwhite.

STEDDY—HARVEY.—On July 23rd, at Chartham Parish Church, Capt. Edwin Seymour Steddy, R.A.F., youngest son of Mr. and Mrs. G. T. Steddy, of Sarre, Kent, was married to Elsa Dorothy, younger daughter of Mr. and Mrs. W. R. Harvey, of Hatch House, Chartham, Kent, by the Rev. E. W. Taylor Jones.

TOZER—DAVIES.—On July 30th, at St. Peter's, Parkstone, Lieut. Philip H. S. Tozer, R.A.F., was married to Margaret E. H., younger daughter of the late Edward Davies, Machen House, Mon., and of Mrs. Davies, Bruffe Lodge, Parkstone.

BIRTHS.

ALLEN.—On August 11th, at nursing home, Colchester, the wife of Claude A. B. Allen, Chaplain R.A.F.—a son.

CURTIS.—On July 28th, 1919, at 40, Alwyne Road, Wimbledon, the wife of James Stanley Curtis (late Capt. R.A.F.), of a daughter.

ELPHICK.—On Aug. 7th, at 10, Coates Crescent, Edinburgh, the wife of Capt. R. Elphick, R.A.F., of a son.

GOODE.—On July 17th, at 24, Walpole Street, S.W., the wife of Captain H. M. Goode, R.A.F., of a daughter.

LOWE.—On Aug. 1st, at Baston Lodge, St. Leonard's-on-Sea, the wife of Lieut. L. G. Lowe, R.A.F., of a son.

ON THE AERONAUTICAL PROSPECTS IN CANADA.

It seems that the British Aircraft Industry and the Civil Aviation Department of the Air Ministry are showing a regrettable lack of interest in the prospects of aeronautics in Canada. There is in that country a vast opportunity for British enterprise, and a few facts on the subject deserve the attention of all concerned with Commercial Aeronautics.

There was introduced into the House of Commons in Canada, on April 29th, Bill Number 80, entitled "An Act to Authorise the Appointment of an Air Board for the control of Aeronautics." This Bill passed the Committee stage without amendment on May 6th. It was drafted by Mr. J. A. Wilson, the Assistant Minister of Naval Service, and was introduced by Mr. Maclean of Halifax.

The Act provides for the appointment of a Minister of the Crown to be Chairman of the Air Board and for another member of the Air Board to be Vice-Chairman. One member of the Air Board shall be a representative of the Department of Militia and Defence and one a representative of the Department of Naval Service.

The text of the Bill is as follows:—

THE HOUSE OF COMMONS OF CANADA.

BILL 80.

An Act to authorise the appointment of an Air Board for the control of Aeronautics.

His Majesty, by and with the advice and consent of the Senate and House of Commons of Canada, enacts as follows:—

SHORT TITLE.

1. This Act may be cited as "The Air Board Act."

AIR BOARD.

2. (1) There shall be a Board on Aeronautics (hereinafter called the "Air Board") which shall consist of not less than five and not more than seven members, who shall be appointed by the Governor in Council.

CHAIRMAN AND VICE-CHAIRMAN.

(2) The Governor in Council shall appoint a member of the Air Board who is one of the Ministers of the Crown to be Chairman of the Board, and shall appoint one of the other members of the Air Board to be Vice-Chairman.

REPRESENTATIVES OF MILITIA AND DEFENCE AND NAVAL SERVICE DEPARTMENTS.

(3) One member of the Air Board shall be appointed as a representative of the Department of Militia and Defence and one as a representative of the Department of the Naval Service.

TERM OF OFFICE.

(4) The members of the Air Board shall be appointed for a term of three years, and shall be eligible for reappointment.

SALARIES.

(5) The members of the Air Board shall be paid such salaries as the Governor in Council may determine.

DUTIES OF AIR BOARD.

3. It shall be the duty of the Air Board:—

(a) to supervise all matters connected with aeronautics;

(b) to study the development of aeronautics in Canada and in other countries, and to undertake such technical research as may be requisite for the development of aeronautics, and to co-operate with other institutions in carrying out such research;

(c) to construct and maintain all Government aerodromes and air stations, including all plant, machinery and buildings necessary for their efficient equipment and upkeep;

(d) to control and manage all aircraft and equipment necessary for the conduct of any of His Majesty's Services;

(e) to operate such Services as the Governor in Council may approve;

(f) to prescribe aerial routes;

(g) to co-operate with other officers of His Majesty, and to assist in the carrying out of any Services under their jurisdiction which may require aerial work of any nature, and to collaborate with the officers employed in existing Air Services of His Majesty in such extension of their present work as the development of aeronautics may require;

(h) to take such action as may be necessary to secure, by International Regulation or otherwise, the rights of His Majesty in respect of his Government of Canada in International Air Routes;

(i) to co-operate with the officers of the Departments of Militia and Defence and of the Naval Service on all questions relating to the air defence of Canada;

(j) to co-operate with the Air Staffs or Authorities of other Governments or countries for any purposes pertaining to Air Services;

(k) to investigate, examine and report on all proposals for the institution of commercial Air Services within or partly within Canada or the limits of the territorial waters of Canada;

(l) to consider, draft, and prepare for approval by the Governor in Council such regulations as may be considered necessary for the control or operation of aeronautics in Canada or within the limits of the territorial waters of Canada; and,

(m) to perform such other duties as the Governor in Council may from time to time impose.

POWERS OF AIR BOARD TO MAKE REGULATIONS WITH APPROVAL OF GOVERNOR IN COUNCIL.

4. (1) Subject to approval by the Governor in Council, the Air Board shall have power to regulate and control aerial navigation over Canada and the territorial waters of Canada, and in particular, but not to restrict the generality of the foregoing terms of this section, it may, with the approval aforesaid, make regulations with respect to—

(a) licensing pilots and other persons engaged in the navigation of aircraft, and the suspension and revocation of such licenses;

(b) the registration, identification, inspection, certification, and licensing of all aircraft;

(c) the licensing, inspection, and regulation of all aerodromes and air-stations;

(d) the conditions under which aircraft may be used for carrying goods, mails, and passengers, or for the operation of any commercial service whatsoever, and the licensing of any such services;

(e) the conditions under which goods, mails, and passengers may be imported and exported in aircraft into or from Canada or within the limits of the territorial waters of Canada, or may be transported over any part of such territory;

(f) the prohibition of navigation of aircraft over such areas as may be prescribed, either at all times or at such times or on such occasions only as may be specified in the regulation, and either absolutely or subject to such exceptions or conditions as may be so specified;

(g) the areas within which aircraft coming from any places outside of Canada are to land, and the conditions to be complied with by any such aircraft;

(h) aerial routes, their use and control;

(i) the institution and enforcement of such laws, rules and regulations as may be deemed necessary for the safe and proper navigation of aircraft in Canada or within the limits of the territorial waters of Canada; and,

(j) organisation, discipline, efficiency, and good government generally of the officers and men employed under the Air Board.

Penalty.

(2) Any person guilty of violating the provisions of any such regulation shall be liable, on summary conviction, to a fine not exceeding one thousand dollars, or to imprisonment for any term not exceeding six months, or to both fine and imprisonment.

Publication of Regulations.

(3) All regulations enacted under the provisions of this Act shall be published in the "Canada Gazette," and, upon being so published, shall have the same force in law as if they formed part of this Act. Such regulations shall be laid before both Houses of Parliament within 10 days after the publication thereof if Parliament is then sitting, and if Parliament is not then sitting, then within 10 days after the next meeting thereof.

Officers and Men.

5. The Air Board shall have power to employ such officers and men under this Act as may be authorised by the Governor in Council, under such conditions as to discipline and pay as the Governor in Council may determine, and may make such arrangements for their proper training, housing, board, clothing, and equipment as may be deemed necessary and as may be approved by the Governor in Council.

Civil Staff.

6. Subject to the provisions of the Civil Service Act, 1918, the Air Board shall have power to employ such officers, clerks, and employees as may be necessary for attending to the business of the Air Board.

Payment of Expenses, etc., under Act.

7. All salaries mentioned herein and all expenses incurred under the provisions of this Act shall be paid out of such money as may be appropriated by Parliament therefor.

Since that Act came into force a number of offices have been created under the Canadian Air Board, as was duly recorded in this paper recently, but so far the names of the officials appointed to those offices have not been made known. The future of aeronautics in Canada, so far as the British Aircraft Industry is concerned, will depend largely on whether these officials are pro-British or pro-American in their sympathies. But to a far greater extent it will depend on whether the British Aircraft Industry has the energy to go and get the Canadian business, or whether it is to be left entirely to the enterprise of cute business men from the United States.

Vast Opportunities.

Although undoubtedly Aeronautics in Canada must develop comparatively slowly, there seem to be very many people in that Dominion who are not merely enthusiastic about flying as such, but who believe firmly in its commercial future. In this they are fully justified because of the fact that Canada is a country of vast expanses with very imperfect communications. The waterways and the plains of Canada afford great opportunities for flying-boats and land-going aeroplanes, and aerial traffic can be established long before railways can be developed.

In this connection it is interesting to note that a trans-Continental route has already been mapped out for aeroplanes. The instructions to those who were given the job of mapping were to keep within reach of a railway as nearly as possible. The particular point of interest in the route chosen is that it is peculiarly suitable for waterplanes of modern type in that, excepting in the Rocky Mountains, there is only one gap between lakes of as much as 150 miles. In most cases the distances between lakes is not more than 20 miles.

Another matter of interest is that, with a view to educating Canadian Members of Parliament as to the uses of aircraft, waterplanes have been told off to make a photographic survey of forest lands between Ottawa in order to check the existing topographical land survey.

Yet another use for water-going aircraft is to be found in communication between the old trading points of the Hudson Bay Company which were originally established so as to give inter-communication by canoes. The great Quebec Company of Reville Frères, who trade with hundreds of these Hudson Bay stations, have been lent a waterplane of some sort to test its possibilities for an exhibition of inter-communication this summer.

In all these cases, one is told, the machines so used are low-powered Curtiss flying-boats which, though good enough in their day, are now utterly obsolete, and would be despised by any pilot with experience of modern seaplanes. Consequently they are much more likely to do harm than good by their evolutions.

Forest patrol, as a safeguard against fires, has been mentioned on various occasions as one form of activity for aircraft in Canada, and it is interesting to learn that two American flying-boats have been lent to the St. Lawrence Forest Protective Association to patrol the large districts north of the St. Lawrence River, and the Quebec Government has made a substantial subsidy to support these boats. It is very much to be regretted that no British firm of seaplane builders had the enterprise to send machines and men to Canada to demonstrate to all and sundry the capabilities of the machines of to-day.

New Activities.

A Canadian evening paper reports that the firm of Greenshields is bringing out a big Canadian company for the manufacture of Handley Page machines. Nothing has been heard of the flotation on this side of the Atlantic, but it is possible that the business may have been achieved. If so, one would like to hear more of it.

Another sphere of activity is disclosed by the fact that the Canadian Pacific Railway about a month ago took out a charter for a flying department, the duties of which would be to organise aeroplane services as auxiliaries or feeders to the railway.

Those interested in flying in Canada would do well to note that practically every Canadian country town has an exhibition ground or racecourse which in most cases is actually suitable for a landing-ground, and in any case could be easily adapted to the purpose.

The Political Situation.

The Canadian House of Commons is utterly lethargic, as one would expect in such a thoroughly British institution, and the expenditure of money is more necessary in developing business in Canada than it is in England, but the business is certainly there to be done.

One point which British manufacturers should particularly note is that the group of Toronto people which is interested in aviation is very largely Americanised, and that if the British Aircraft Industry is to get business in America it will have to make up its mind to fight strenuous American competition.

It must be remembered that a group of American speculators bought 400 Curtiss aeroplanes which had been built either in America or Canada for the training of the Canadian Air Force, and that these machines have been planted on Canadian buyers. In the end this may very possibly work to the advantage of the British Aircraft Industry, as proving that British aeroplanes are the best in the world, but it is bound to give aviation in Canada a set-back unless the British Industry gets to work immediately. Without in the least decrying the quality of material or workmanship in the Curtiss machines, it must be obvious to anybody who knows anything of aviation that, good as a 90 h.p. or 120 h.p. Curtiss machine may be for training purposes, it is not the type of machine with which to develop serious aviation in a vast country like Canada.

The Need for British Enterprise.

If the Canadian business man is to be impressed with the practical utility of aircraft he must be convinced by means of demonstrations with the very latest and best types of British commercial aeroplanes, and not by means of converted war machines, and most certainly not by means of elementary training machines.

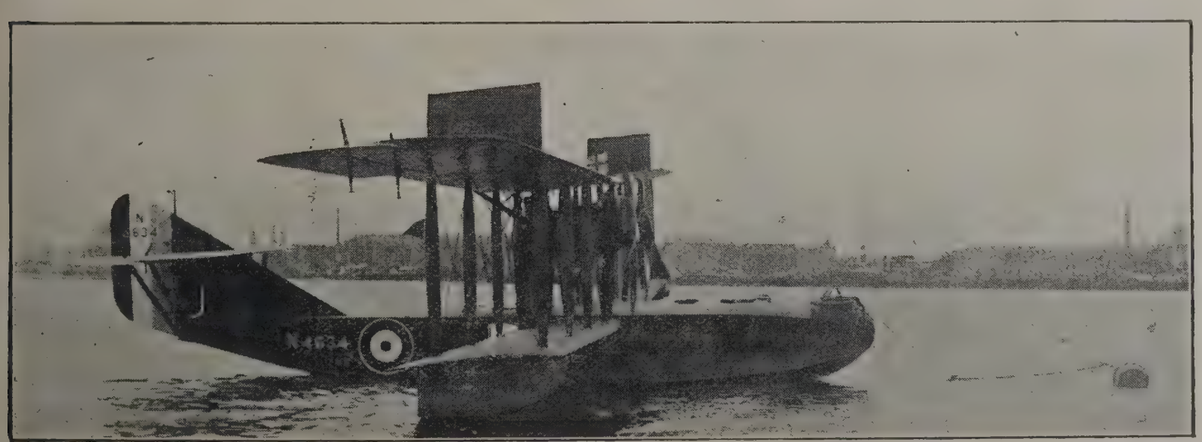
British firms who want to do business in Canada must not expect Canadians to fall upon them with entreaties to be allowed to buy British aeroplanes; they have got to go and get the business. They have got to convince the Canadians that aeroplanes are practical vehicles; they have got to remove any bad impression which may have been given by failures of inferior machines; and they have got to do a great deal of the actual operating of the aeroplanes with their own money during that period. When British aeroplanes and British transport services have made good in Canada, then Canadian money will be forthcoming for further developments.

THE SAVING CLAUSE.

Happily there is a strong pro-British element among those in Canada who are interested in aviation; for example, a new Association has recently been formed in Montreal which embraces 300 ex-flying people of the R.A.F. who have broken loose from the Americanised Canadian Aero Club, and who are full out to support British enterprise, but they in turn must be supported by British enterprise.

The British Aircraft Industry has a great opportunity in Canada if it will only lay itself out to grasp that opportunity; but the Industry will wreck the progress of aviation in Canada as well as all its own prospects of future business there if it leaves the field at the moment to get-rich-quick Americans who are only intent on planting what in this country would be low-grade salvage stuff on the innocent Canadian buyer.—C. G. G.

"ECONOMY" IN AIRSHIP CONSTRUCTION.



In earlier and happier days the more popular news-prints, deprived of the humour of Parliament, the thrill of murder, or the absorbing charms of Divorce Court drama by the placid instincts of late summer and autumn, resorted to a form of amusement aptly termed "Silly Season Topics." Started by an an intriguing letter written by a member of the editorial staff, though signed by "A Father of Nine" or "A Tooting Cyclist," leaders, correspondence columns, and news pages were each day charged with argument and enthusiasm as to some such subject as "Paper-Bag Cookery" or "Are Tomatoes Nourishing?" The amusement served its purpose. It filled the columns and helped music-hall comedians, while it did no harm to the public, as none of discrimination ever read one single line of all that was written.

To-day, in sadder times, there are greater subjects with which to fill the summer hours of idleness. The war is over, the debt of life is paid, and all that remains is to settle that part of the bill which money alone will satisfy. The paying of the bill gives a happy opening to the editors of "Silly Season" columns, and they have not failed to avail themselves of the opportunity. Each day the cheaper news-prints are filled with heavily leaded columns demanding retrenchment and economy without ever suggesting any reasonable method of obtaining either. The public, angered by the price of beer or butter, has accepted readily the opportunity to criticise in tube, tram, and dining-room those who are charged with the care of the national finances. All humankind are spending wildly in the reaction of peace, but none approve of the governing classes in their methods of settling the national accounts.

There is waste—and colossal waste—in many branches of the Government Services, but it is entirely the result of war. If the nations demand war, the nations must pay for war. All amusements are expensive, and after the joy is dead regrets are only too apt to linger. It was necessary in war-time to order far in advance of immediate requirements, and with no knowledge of the time when such material would cease to be necessary. War is not like the shooting season, with a definite calendered beginning and end. It ends only with victory or defeat, and either of these are in the hands of Fate alone.

But the news-prints and popular clamour have scared Mr. Lloyd George, whose dislike of unpopularity amongst the proletariat is the prevailing instinct in his life. The fear of downfall has driven him to incite his colleagues to ruthless "economy." At the same time he is forming new Ministries to control everything except the sea tides, which even his mental predecessor, King Canute, found unamenable to his will.

At his direction works begun during the war and rapidly nearing completion are being destroyed at vast expense. Staffs are being reduced in every working department of State, regardless of the morrow. The machinery of government is suffering from the pruning of an amateur gardener, whose only true knowledge is oratory. But the future disasters will be camouflaged for the present, while the public happiness is increased

The F5 Flying-boat (two 350 h.p. Rolls-Royce engines) built by the Gosport Aviation Co., which was exhibited and demonstrated by that company at the E.L.T.A., Amsterdam, by permission of the Air Ministry. The photograph shows the boat moored off Amsterdam. This Flying-boat has now returned to England.

by the sight of widespread destruction wrought in the name of "economy." (It would do Mr. Lloyd George but little harm if he were to look up the word "economy" in the New English Dictionary. He would then perhaps realise its meaning.)

But that side of the "economy" campaign which interests the aeronautical industry is the action taken this week by the Admiralty in the practical stoppage of all work on airships.

Before the war we were a decade behind the Germans in the theory and practice of airship design. Where we had argued they had done the work. With the war came the realisation of the value of airships, and in a curiously haphazard way we began to make up for lost ground. Against innumerable difficulties the Airship Department of the Admiralty carried through a programme which in the last year of war produced rigid airships but little behind the best German rigid airships in design and performance, whilst in the non-rigid classes we lead the world.

As a result of the experience gained, several rigid airships of large size were at the beginning of this week under construction in the works of Armstrongs, Vickers, and Shorts. All work has now ceased at these three places, though the R37 at Shorts may be completed at a later date. As a result about 1,400 workpeople experienced in the intricacies of airship construction are out of work, and will disperse to other industries more stable of existence. Their training is wasted, and shortly they will forget all they have learned.

The one industry in which Great Britain can gain and maintain a world supremacy is that of aeronautics. Yet now as a measure of economy we are to throw aside one part of our leadership. Airship design is in its infancy—that period in which careful nurture is most essential. The child industry cannot live by itself. It must be supported. Yet that support is being removed.

The immediate prospects of profit from the employment of airships are not promising. Further progress, both in design and performance, is essential before an airship transport service can be safely and profitably maintained. And the Government alone can bring about that progress by the economical (in the proper sense) production of a series of airships.

If these airships are completed, they will possess a certain capital value. If they are left in their present state, they are entirely valueless. The expense of shutting down the works will be almost as great as that of completing the ships.

Cannot the public, who are mainly responsible for the shutting down of construction, wake up a little from its drugged dream of "economy" and demand that here at least we shall not waste future prosperity through present parsimony.

It is useless to blame the Admiralty. The airship programme would still be carried out were it not for the effect of public clamour on the thoughts of Mr. Lloyd George. Therefore as Mr. Lloyd George is so easily influenced, it is the duty of the people, if they are to show that democratic rule has any advantages at all, to insist that the Admiralty decision must be reconsidered at once.

W. E. DE B. W.

AN HONOUR FOR MAJOR-GENERAL SIR F. H. SYKES, K. C. B., C. M. G.

The appointment of Major-General Sir Frederick Hugh Sykes, K.C.B., C.M.G., to be Knight Grand Cross of the Order of the British Empire (Military Division) was gazetted on August 26th. This award has been made specifically because of his services to aeronautics. He has been a loyal servant of the new science since the very early days of practical successes in aviation, and he has by his efforts contributed largely to the attainment of the position now held by the Royal Air Force.

All who appreciate the work he has done will congratulate him on the honour the King has chosen to bestow upon him.

THE RETIREMENT OF SIR RICHARD GLAZEBROOK, C.B., F.R.S.

It is officially announced that Sir Richard Glazebrook, C.B., F.R.S., retires from the Directorship of the National Physical Laboratory, on reaching the age limit on Sept. 18th, and that Professor Joseph Ernest Petavel, D.Sc., F.R.S., has been appointed to succeed to that position.

Sir Richard Glazebrook, who is a scientist of world-wide renown, and a recognised authority upon methods of accurate physical measurement, has, both as Director of the N.P.L. and as a member of the National Advisory Committee on Aeronautics, exercised an important influence upon the progress of the science of aerodynamics in this country.

It is to be held to his credit that the experimental measurements made at the National Physical Laboratory, both in the Aeronautical Department and elsewhere, bear a universal reputation for accuracy and reliability.

Whether the deductions which have been drawn therefrom are equally accurate and reliable is a matter with which the late Director of the N.P.L. has probably had little to do.

In Professor Petavel the N.P.L. has a worthy successor to Sir Richard Glazebrook, and it may safely be expected that under the new Directorship the existing high standard of accuracy will be maintained by the establishment.

THE JACQUES SCHNEIDER INTERNATIONAL SEAPLANE RACE.

The following communiqué has been issued by the Royal Aero Club :—

This race will be held at Bournemouth on Wednesday, Sept. 10th, 1919, and machines representing France, Italy and Great Britain will compete. The course is 200 nautical miles, over a circuit of 20 miles (10 times round) in Bournemouth Bay. The start of the race will take place about 2.30 p.m.

The Royal Aero Club has obtained the loan of the T.S.Y. "Ombra" (350 tons) to accommodate the members on the day of the race. This yacht will be anchored off Bournemouth Pier, and will be the official starting and finishing point, the competitors passing 10 times during the race. Tickets, £2 each, including luncheon and tea on board.

Members are requested to make early application to the Club for tickets.

Motor launches will convey members from the pier to the yacht between 12 noon and 2 p.m. on the day of the race.

Arrangements have also been made for a members' enclosure at the head of the pier, Bournemouth, and tickets admitting to the pier and enclosure may be obtained from the Club.

The following are the competitors :—

GREAT BRITAIN.

Sopwith (450-h.p. Cosmos 'Jupiter"), pilot, H. G. Hawker; Supermarine (450 h.p. Napier "Lion"), pilot, Squad-Comdr. B. D. Hobbs, D.S.O., D.F.C.; Avro (Siddeley-Deasy "Puma"), pilot, Capt. Hammersley; Fairey (450 h.p. Napier "Lion"), pilot, Lieut.-Col. Vincent Nicholl, D.S.O.

(Three competitors from the above are being selected by the Royal Aero Club to represent Great Britain.)

FRANCE

Nieuport (300-h.p. Hispano-Suiza), pilot, M. Malard; Nieuport (300-h.p. Hispano-Suiza), pilot, M. Casale; Spad (300-h.p. Hispano-Suiza), pilot, M. Sadi Lecointe.

ITALY.

Savoia S.13 (250-h.p. Isotta-Fraschini), pilot, Sig. Janello.

OFFICIALS OF THE RACE.

STEWARDS OF THE MEETING (Commissaires Sportifs).—Brig.-Gen. Sir Capel Holden, K.C.B., F.R.S. (Royal Aero Club); Mr. G. B. Cockburn (Royal Aero Club); Lieut.-Col. Alec Ogilvie (Royal Aero Club); M. Paul Rousseau (Aero Club de France).

STARTERS.—Lieut.-Col. F. K. McClean; Lieut.-Col. Spenser D. A. Grey, D.S.O.

TIMEKEEPERS.—Mr. A. V. Ebblewhite and Mr. A. G. Reynolds.

PRESS STEWARD.—Lieut. B. Stevenson.

MARK-BOAT OBSERVERS.—Mr. Howard T. Wright; Lieut.-Col. H. T. Tizard; Squadron Leader T. O'B. Hubbard, M.C., R.A.F.; Major R. H. Mayo; Major R. E. Nicoll.

BRITISH MOTOR-BOAT CLUB PATROL.—Mr. R. H. Cobb; Mr. T. Desnos; Mr. B. S. Millard; Col. C. Pierce.

CLERKS OF THE COURSE.—Group Captain C. R. Samson, C.M.G., D.S.O.; Lieut.-Com. Harold E. Perrin.

CIVIL FLYING

WITH

THE SOPWITH "DOVE" 2-SEATER
SPORTING MODEL

COMFORT AND ECONOMY

The Sopwith "DOVE" is a sporting and utility aeroplane, based, in point of design and general arrangement, upon the famous Sopwith "PUP."

With its fast climb, high-speed, quick manoeuvrability and wide-speed range it is an ideal safety-first pleasure aircraft.

THE RIFF-R.A.F.

By "THE SNIPE."

Many years ago one remembers talking to an American journalist who had come to London under the impression that British newspapers needed what in those days was called "hustling." He had the idea—common in that country at the time—that British newspapers were dull because they did not contain coloured pictures and did not appear with front pages that looked like posters owing to the magnitude of the type used for headings.

When he had become accustomed to the fact that we preferred reading-matter to contents-bills and examples of the draughtsman's lack of art he became a fairly broad-minded critic—of the Yellow Press of his own country.

Regarding the different policies, he said he was most impressed by the fact that in England the Press seemed to be entirely engaged in the work of deriding everything British and in pointing out how much better all things are done in other countries. The American Press, on the contrary, stroked their readers until they purred. They derided the institutions of other nations and pleased their readers by telling them that everything in God's own country was the best. If tales of appalling political corruption had to be told, the newspapers would console the public by saying that for ingenuity and vastness of design the world could show nothing to equal American corruption and political crime.

American thieves were the most brainy, American drunkards the most drunken, and American grafters the graftiest in the universe.

SELF-DEPRECIATION.

To some extent the war has opened the eyes of America to the perils of self-adulation, but Britain retains her fondness for self-deprecation. Our newspapers, almost without exception, ooze pessimism. The national sport is the baiting of the public servant, who, because he has an official ring through his nose, is unable to hit back.

All through the war we were slanged by every morning paper, by special editions throughout the day, and by three-halfpenny editions on Sunday. Up to the very moment of the Armistice we were told that we were losing the war; after the war we were told that our enemies would beat us yet, and that if they did not our victory would ruin us for ever and ever, amen. One is getting rather tired of it.

The story of the Flying Services and the R.A.F. is a never-ending serial of abuse. Our critics in the daily Press would lead the public to believe that the greater part of the Force is made up of wild, overpaid officers given to drunken orgies and less respectable crimes, that the airman is an undisciplined lazy Cuthbert who tunnelled his way into the Force by influence in order to escape the trenches, and that every action of the Air Ministry has been inspired by lunatic minds.

Our dirty linen has not been washed in public; it has been flaunted unwashed. If any paltry charge can be trumped up, it is "An Amazing R.A.F. Scandal." If, in the terrible struggle we had to gain the mastery of the air, a little more money was spent than the ignorant Press think necessary, we have accusations of bribery and graft. If a youthful R.A.F. officer makes a slip from virtue, specially trained muck-rakers of the Press expend their iron and gall over him, and we have articles on the immorality of the R.A.F. written by "Our Own Co-respondents," judging by the knowledge displayed regarding such matters.

It is easy to say that there is no smoke without fire; but it is equally true to say that a very small spark may become a big blaze if fanned maliciously.

The campaign of calumny has been carried out so effectively that it seems likely that the Force will be known as the Riff-R.A.F. for ever.

Of course, there have been scandals; there always will be. Of course, there have been muddles; the only people who never make mistakes are those who never do anything. Of course, we are open to criticism because we dared to serve and take the pay of those who succeeded in avoiding service. Of course, we had black muttons among us—some of these ebon rams were damned good fighters.

THE OTHER SIDE OF THE PICTURE.

But in the post-mortem on the war that is now sitting we hear nothing of the other side. Our critics know nothing of the difficulties under which we laboured in the days when all seemed dark. While the outsiders jeered at the "Rabbits" in vast hotels and derided the beauty show of uniformed flappers and called down the wrath of Heaven because they took afternoon tea, the foundations were laid of the final victory in the air.

It is so easy to criticise and so hard to build up a vast organisation in the stress of a world war. It is so easy to raise a cheap laugh over a departmental letter dictated by an overworked amateur official who has had to learn his job at a moment's notice, and which has been typed by an uneducated flapper because no trained typists are available.

Of course, we blundered and muddled. It is so easy to be wise now and to see our mistakes, but most of us blundered in good honest ignorance—not through slackness. The will to win was there.

We worked with tools that were not the best. Our airmen were mostly low-categoried men, throw-outs from the other Services, but the percentage of slackness among them was probably lower than in the Army, though perhaps they did not look so smart when off duty.

One wearies of the "scandals," the fault-finding, and the heart-burnings over blunders that cannot be remedied now. It is all very well to be modest and self-deprecatory, but, hang it all, we might as well remember that, in spite of all the difficulties and muddles, we did reach the stars in the end.

THE NEW R.A.F. TITLES.

It is notified by the Air Ministry that an Order has been promulgated directing that the new titles for officers of the Royal Air Forces are to be brought into use in the Force forthwith.

The new titles, which were published on Aug. 4th last, apply to all officers of the R.A.F., whether permanent or temporary, attached to or seconded for service with the R.A.F.

ANOTHER TEA-CUP STORM.

According to information sent to the "Daily Express" by one of its readers:—"At the Eastchurch Aerodrome, near Sheerness, on the occasion of an official inspection last Wednesday, many workers, male and female, earning from 52s. 6d. to 60s. per week, were granted a half-holiday, so that they should not be seen.

"Men who have a job waiting for them are being retained, while men who have nothing to do are being demobilised. Demobilised men who cannot find employment are, of course, entitled to out of work pay, while the retained man costs the Government a considerable sum."

This merely strikes one as another example of the prominence given by the newspapers to the small "scandals," while no attention is given to the great ones.

MARTINSYDE

DESIGNERS OF THE FAMOUS

F4 FIGHTER

WHICH ESTABLISHED THE

FINEST PERFORMANCE

FOR CLIMB AND SPEED AT HEIGHT.

A ROLLS-MARTINSYDE

CARRIED GOVERNMENT DESPATCHES

FROM LONDON TO PARIS

IN 75 MINUTES.

COMMERCIAL TYPE A.

INQUIRIES INVITED FOR PASSENGER—OR MAIL—CARRYING MACHINES OF THIS TYPE.
SPECIFICATIONS WILL INCLUDE

285 H.P. ROLLS-ROYCE FALCON ENGINE, or
300 H.P. HISPANO-SUIZA ENGINE.

APPROXIMATE PRICE £2,500.

Note.—All above Types can be fitted with interchangeable land undercarriage or seafloats.
SPECIAL PROVISION IS MADE FOR HOT CLIMATES.

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

The Schneider Cup Race.

The British eliminating trials for the Schneider Cup race are being held on the afternoon of Wednesday, Sept. 3rd—too late to be reported in this issue of THE AEROPLANE.

The Avro seaplane made its first trial flight on Aug. 29th at Hamble. The tests were successful in that the machine was in excellent trim and showed a good turn of speed. On landing one float was damaged, but clever handling by the pilot, Capt. Hammersley, brought her safely to the beach.

The Fairey competitor has made a number of test flights at Hamble. It is understood that the speed attained was quite appreciably in excess of the design estimates, and that this machine will be a serious competitor even if the sea at Bournemouth on the day of the race is glassy smooth.

No details of the foreign competitors are available at the time of writing—other than those already published. It is, however, gathered that the two Nieuports entered will be, to all intents, of the type used by Lieut. Casale in the height and speed records recently chronicled, fitted with a light float undercarriage. The Spad is believed to be the Spad Herbemont type—illustrated in this paper recently—similarly adapted to the race.

For the Nieuport Company, M. Prévost—whose deeds were famous in pre-war days—and M. Kirsch will be the reserve pilots. It would be interesting to see M. Prévost again take the air in a great race, and his appearance would be popular.

The Savoia—Italy's sole representative—will probably be of the flying-boat type, but no details are yet to hand.

The England to Australia Competition.

There are four entries up to the present for the £10,000 prize offered by the Australian Government for the first successful flight from England to Australia by an Australian. The "Newcastle Chronicle" gives the names of one group of competitors. They are Lieuts. C. P. Rendle and D. R. Williams (pilots), G. H. Potts (engineer), and Capt. Wilkins, M.C. (navigator). All but Lieut. Rendle, who served in the R.A.F., were members of the Aus. F.C.

Capt. Wilkins was a member of Steffensen's Polar Expedition (1914-16), and for two years, at the end of the war, he was an official photographer for the A.I.F. on the Western Front.

They will use a Blackburn "Kangaroo," fitted with 240 h.p. Siddeley-Puma engines. They are taking no spare parts. According to the conditions of entry the journey must be completed in 30 days, and a stop must be made at Singapore.

The route to be taken is as follows:—London, Turin, Crete, Cairo, Karachi, Calcutta, Singapore, Surabaya, Timol and Port Darwin (Australia). This is approximately 10,000 miles by air.

No attempt can be made before Sept. 8th, the date on which the monsoon season in India normally temperates.

A Fatal Accident.

One regrets to record that Brig.-General Charles Lee (late R.A.F.), was killed at Weston-Super-Mare on Monday evening, September 1st. He was flying a machine and had with him two passengers, both of whom were injured. It appears that when at a height of between one and two hundred feet the engine failed, the machine sideslipped, and then nose-dived on the Weston-Super-Mare golf links.

The passengers were Lt. A. J. Andrews, of the 20th London Regiment, and Mr. Roderick Smith. The former is suffering from concussion and abrasions, and the latter from severe facial injuries, but both are progressing favourably.

Brig.-General Lee was at one time at the Air Ministry. He had seen service overseas, and was head of the British Aviation Mission to the United States of America, and did much good propaganda work for the British aircraft industry. Recently he was appointed air transport manager to A. V. Roe and Company.

The British Association at Bournemouth.

At the meeting of the British Association to be held at Bournemouth from Sept. 9th to Sept. 13th there will be discussed, among many other subjects, aviation during the war, aerial routes, aerial photography, and wireless telegraphy. The general meeting will be held in the Winter Gardens Pavilion, commencing with the presidential address by the Hon. Sir Charles Parsons, on "Engineering and the War."

The New R.A.F. Ribbon.

The following letter appeared in the "Times" of Aug. 30th.

Sir,—The changes in the ribbons of the Royal Air Force crosses and medals have come at a time when economy should be the order of the day. I am not aware of the contract prices of the ribbons in question, but it would be interesting to know what the alteration will cost—(1) the Government for the free issue of the new ribbon and the "scrapping" of the old; (2) to firms who possess many hundreds of yards of the old ribbon, which is now useless. The change from horizontal to diagonal bars of colour and white was presumably introduced for simplicity, but the orders as to the wearing of the new ribbons are complicated in the extreme, while both varieties are equally tasteless. The range of colour combinations is infinite. It would have been quite possible to design ribbons of the ordinary sort which, while distinctive, do not resemble the covering of a mattress or the material commonly used for braces. Moreover, the designers of the D.F.C. and the A.F.C. cannot be congratulated upon their taste, for the crosses are unnecessarily large, undignified, and vulgarly decorative. Those responsible for such things, however, do not appear to have much originality, for the new R.A.F. long service medal ribbon, half blue, half red, with white edges, must be suspiciously like the special H.A.C. Territorial ribbon, half blue, half red, with narrow yellow edges. ARIEL.

A Difficult Flight.

The Porte type Gosport F5 flying-boat that was at the E.L.T.A. Exhibition at Amsterdam had a very rough return voyage to England. The flight from Amsterdam to Felixstowe was made against a 50 or 60-miles an hour wind, and at times it was necessary to steer 35 degrees west of the true course. The crossing was, however, made in just under three hours.

When the flying-boat alighted at Felixstowe the sea was so rough that green waves washed over the lower planes and one hour and a half passed before a boat was able to take off the crew, which consisted of Col. R. Hope Vere, A.F.C., the pilot, Mr. H. Volk, Mr. Nicholson, and two others.

The Rolls-Royce Eagle VIII engines ran perfectly throughout. The seaworthiness of the flying-boat was very thoroughly demonstrated, for in spite of the rough sea which submerged the lower planes no damage of any kind was done to the machine.

Alleged Smuggling by Air.

At Trelleborg a case against Dr. Stockhausen and the Countess of Solms-Wildenfels is being heard. They are charged with smuggling valuables into Sweden by aeroplane. Some of the articles belonged to Prince William of Wied.

M. Lidfors, of Stockholm, who is counsel for the accused persons, explained that the Prince of Wied had a permit to export his fortune to Switzerland, but considered Sweden a safer place. The numerous German railway robberies induced him to carry his valuables by aeroplane. M. Lidfors declared that the charge of attempting to deceive the Customs authorities was ludicrous, as the duty only amounted to kr.265 (£14 14s.).

The evidence showed that Dr. Stockhausen and the Countess of Solms-Wildenfels tried to escape, and that they denied before the police that they had any valuables in their knapsacks.

The 14th Wing, R.A.F., Italy.

A dinner has been arranged for officers of the 14th Wing, R.A.F., Italy, at the Imperial Restraurant, Regent's Street, at 7.45 p.m., on Sept. 20th. Any officer of the unit who wishes to attend should forward a cheque for £2 4s. to Officer Commanding, No. 2 (Training) Group, R.A.F., Uxbridge.

No. 40 Squadron, R.A.F.

A dinner is being arranged by 40 Squadron, R.A.F., for Friday, Sept. 26th. Those who wish to attend should communicate before Sept. 19th with Capt. H. C. Todd, R.A.F. Club, 13, Bruton Street, W., or Major the Rev. B. W. Keymer, H.Q. Midland Area, R.A.F., Leamington Spa.

The Paris Aero Salon.

The organiser of the Paris Aero Salon to be held in December is M. Granet, Commissaire-General du 6E Salon Aeronautique, 12, Rue Anatole de la Forges, Paris.

"A wonderful RADIATOR TESTIMONIAL"

In addition to Aircraft Radiators the following are some of this year's Gallay Successes.

Arrol - Johnston (Victory Model), Vauxhall, Vulcan, Straker - Squire, Bentley Motors, Sizaire - Berwick, British Ensign (post-war) and numerous others. The Gallay Company "made good" before the war, during the war and after the war.

This letter constitutes a fine testimonial to Gallay Workmanship and Material.

We supplied these radiators in the ordinary course of business, and had no idea of the strenuous use to which they were to be put, until this report of their faultless performance came to hand.

The Alliance Aeroplane Company, Ltd.

14th August 1919.

Messrs. The Gallay Radiator Co.,
Scrubbs Lane,
WILLESDEN. N.W.

Dear Sirs,

You may be interested to know that the Radiators supplied by you were used in the construction of the "SEABIRD", the machine designed and built by this Company for commercial purposes, which recently made a non-stop flight to Madrid, a distance of 900 miles, in 7¾ hours.

This is the first direct flight from London to the Spanish Capital, and with the exception of the Vickers "Vimy" machine which flew the Atlantic, we believe we are correct in stating that our machine is the only one of British design which has completed a non-stop flight to its destination after covering as great a distance.

You are at liberty to make whatever use of this information you may think fit.

Yours faithfully,
For THE ALLIANCE AEROPLANE CO. LTD.

The WORLD of AERONAUTICS (continued)

A South Pole Expedition.

The British Imperial Antarctic Expedition will set out in June, 1920, for five years of exploration in the Antarctic. Mr. John L. Cope, who accompanied the Imperial Trans-Antarctic Expedition to the Ross Sea in 1914-17, is leading the expedition. An aeroplane is to be taken, and both it and the ship will be equipped with wireless telegraphy.

After leaving England in June they propose to sail for Wellington (New Zealand), and then proceed to Macquarie Island, where a geological survey is to be made. Wireless and meteorological stations will be established at Scott Island, and headquarters will be made at New Harbour.

The distance of the Pole from the base from which the aeroplane will start is 750 miles. A sledge and extra provisions will be carried on the machine in case it breaks down. Consequently, a minimum of fuel only can be taken.

High mountain ranges have to be crossed, so it is proposed, on the journey to the Pole, to dump half the petrol before they are reached.

It is hoped to use directional wireless from the base, and so get "tail bearings" on the aeroplane.

Aerial navigation is greatly dependent on meteorological forecasts. Antarctic information would help tremendously in making long-range weather charts.

One would think that rather than carry a sledge on the aeroplane another machine might well be taken on the expedition. This could locate the first if it had any trouble and carry petrol and spares to it from the base.

A more sensible way of making a dump of petrol would appear to be to make it on a trip previous to the attempt to reach the Pole. If the sledge were then dispensed with a good quantity might well be carried over the mountains and dumped on the other side.

From Propellers to Watches.

A news-sheet stated recently that "the myriad aircraft factories which turned out fuselage and propeller and aileron during the war have gone back to the manufacture of pianos and watches and perambulators."

The machinery for the manufacturing of propellers, etc., would not appear to be easily adaptable to the production of watches, but the British are an ingenious race.

A Change of Address.

The Technical Supply Branch, Canadian Air Force, is moving from 245, Oxford Street, London, to Ottawa. Letters for the branch should in future be addressed to "The Chairman, Canadian Air Board, Ottawa, Canada," and marked "for attention of O/C. Technical Section."

For the Amateur Aviator.

Writers who had the enormous advantage that ignorance gives to those who trade in fiction were fond of stating that after the war thousands of people would buy aeroplanes for private use and be their own pilots, just as ten of thousands of people own and drive their own cars.

These sanguine prophecies do not seem likely to be realised for some time. Thousands of demobilised pilots have bought cars or motor-cycles with their gratuities, in spite of high prices, but one hears of very few who have bought aeroplanes, although the Air Ministry has been almost ready to give them away.

The fact is, of course, that the machines designed for the war are quite unsuitable for private use owing to the expense of upkeep The enthusiastic amateur requires something that he can keep in tune himself without the assistance of half-a-dozen mechanics. Generally speaking, machines designed during the war were so planned that even the smallest adjustment to the engine was a matter of extreme difficulty. In some cases a machine had to be partially dismantled before any adjustment could be made to the carburetter or magneto. No motorist would tolerate a car so designed that the body had to be removed and the engine taken out of the chassis before the points of the magneto could be adjusted.

For commercial and pleasure purposes in order to save labour it will be necessary for aeroplane designers to give much more attention to "get-at-ability." A few post-war low-powered machines show that some consideration has been given to this point, but there is still much to be done.

An Altitude Record Claimed.

On July 25th, Roland Rohlfs, a Curtiss test pilot, claimed an American altitude record by ascending to a height of 31,100 ft. The machine used was a Curtiss "Wasp" triplane with a 400 h.p. Curtiss engine. Under Government tests it has attained the speed of 160 m.p.h.

An Aerial Photograph of Boulogne taken during the trip of the first machine to fly to Paris on the London-Paris Air Service.

BRITISH RECORD.

The Royal Aero Club has informed D. Napier & Sons, Ltd., that the speed attained by Captain Gathergood when he won the Aerial Derby with a 450 h.p. Napier "Airco" machine on July 21st has been accepted as a British Record for a closed circuit; the speed on that occasion was 129.3 miles per hour.

The magnetos used on the above-mentioned aeroplane were B.T.H. type AC.12s.

The WORLD of AERONAUTICS (continued)

Much Pay and No Work.

A Flight Serjeant of the R.A.F. has written to the "Times" as follows :—

". . . I . . . have earned nothing in the Air Force for months, and have been paid 9s. 3d. a day for it. I have applied on six occasions for demobilisation, and have stated my willingness to forfeit all bounty and pay, quite £50, for an Army discharge. The peace establishment of my present section is one Serjeant; there are now three Flight Serjeants and two Serjeants doing this one-man job. The difference in actual pay is £2 4s. 9d. a day, exclusive of rations, clothing, separation allowances, and accommodation. There are dozens here in a like state. Why we are not demobilised is a mystery. A telegram sent from the Air Ministry on June 3rd, 1919 (Reference A.M.T./950/Demob.) authorised the discharge of N.C.Os. and men enlisting before June, 1916. I enlisted in February, 1916."

Air News.

The "Central Airnews," of 104, High Holborn, W.C.1, is a new venture for the supply of aviation news to the public Press. According to the prospectus :—

"The universal demand for aviation news and articles has led many non-technical editors to accept penny-a-line trash from the pens of office-desk airmen, usually dwelling on the sensational side of flying—such as stunts, crashes, etc. "Central Airnews" was founded to combat this tendency by supplying popularly written yet high-class articles, for the benefit of aviation; and, at the same time, to pay its way by the sale of these articles, news paragraphs, photos, etc."

The venture has one's good wishes.

The Truth.

In an article upon the use of aeroplanes for mail carrying "Truth" says :—

"The aeroplane is a machine that must do its work quickly, and then be put on the scrap-heap. The life of its engine is only about 100 hours, but if in the 10,000 or 12,000 miles it travels in that time it can earn its own cost and a fair profit for its owners it is all to the good of trade and progress to scrap it for something newer and better. A point that Mr. Illingworth and others who think in terms of efficiency would do well to bear in mind is that the aeroplane in flight is, by reason of its vastly superior speed, more efficient than any other vehicle of locomotion, and that is surely worth something in these days."

One agrees with most of the views expressed, but one can assure "Truth" that the life of a modern aero engine is considerably more than 100 hours.

Grumbles.

The new rank titles have not been received with pæans of joy by the R.A.F. It was not to be expected that the changes would be welcomed, for we are all inclined to be conservative. Critics say that the rank titles are an unpleasing mixture of those of the Navy and Army, for example, Marshal is distinctly an Army rank, Commodore Naval, Commander suggests the Navy, and Squadron Leader turns over thoughts to Cavalry.

The junior ranks appear to be most disturbed. Sec. Lieuts. say that Pilot Officer does not sound like a commissioned rank; it suggests Petty Officer or Warrant Officer. Flight Lieutenant is generally considered a poor substitute for Captain, which was a rank that the general public understood.

The prefix "Flight" to the public does not imply a unit; to them it means aviation. It may possibly please a few administrative Captains to bask in the glamour of a title that implies to the populace that they fly, but they are by no means pleased to return to the rank of Lieutenant which they held for dreary years before promotion came.

One has not met many Majors who are pleased with the new title of Squadron Leader. Again, this seems a step back. Colonels who become Group Captains are equally unhappy.

In time the R.A.F. may become accustomed to the new rank titles, but it is useless to pretend that they are popular at present. As somone remarked at the R.A.F. Club the other day, "the only decent thing they can do is to give us all a step up to compensate us. At present it seems that we have all been demoted."

No statement has yet been made as to the position of demobilised officers. A very large proportion of them hold letters from the Air Ministry stating that they are permitted to retain the ranks of Colonel, Major or Captain, as the case may be. Most of them value this courtesy, and the apparent retrogressive step is anything but pleasing. A Colonel who has been given the right to retain that honourable rank for life cannot be expected to feel flattered if he is in future to be known as a Group Captain, a title which, for many years to come, will not indicate to the world the rank he held in the war.

Aeroplane versus Motor-Car.

The "Aircraft Journal" of America tells how an aeroplane was used for the purpose of catching a motorist at Los Angeles.

A motor-cycle officer tried to overtake a speed maniac going at 60 miles an hour or thereabout in one of the suburbs of the city. He was forced to stop due to engine trouble, but being near a commercial aviation field and being an air pilot himself, he obtained the use of an aeroplane and went after the offending motorist at the rate of 90 miles an hour. He made a good landing two miles ahead of the motor culprit, and the latter, slowing down, thinking the pilot was in trouble, was coolly informed that he was under arrest. It was the first case in the court records there of an arrest for automobile speeding by aeroplane.

Out of Work.

An officer, late of the R.A.F., who has been seeking employment since he was demobilised last March, was offered recently a job as commercial traveller for a drapery house. He regarded this as an insult. One knows of others, however, who are acting in the right spirit by taking any work that offers a living wage while they are looking for the position to which they think they are entitled. There is no doubt that many of the stories one hears of hard luck are due to the fact that large numbers of young pilots have been spoiled by the high pay and rank they enjoyed in the R.A.F. and are not ready to take positions that they would have accepted gladly before the war. One meets hundreds who idle the time away so long as their gratuities hold out, and then wail about the treatment they receive from an ungrateful country. These are not the type needed to-day for the work of reconstruction, and it is not surprising that when they do come to the end of their ready money they find themselves unable to obtain positions of any sort. There are some cases that are deserving of sympathy, but not these.

A Sports Meeting.

The staff and employees of the Weybridge Works of Vickers, Ltd., held a successful second annual sports meeting at Byfleet on Aug. 23rd, which was organised by Mr. C. Choate.

Although the ground was not an ideal one for the purposes of an athletic meeting, good tracks were prepared, and some 2,000 spectators witnessed keen running and close finishes.

The finish of the final of the 100 Yards Open Handicap was very close, S. Usher (of the Army Gymnastic Staff and Surrey Athletic Club) just beating W. A. Hill (Amateur 100 and 220 Yards Champion) by a foot in 9 4-5 sec.

Prior to the sports an informal luncheon was served in a large marquee erected on the ground.

Included among the company who sat down were Sir Arthur Whitten Brown, K.B.E., Lady Brown, Sir John Alcock, K.B.E., D.S.C., and his fiancée, Capt. Vickers, Capt. Acland (Chief of Vickers Aviation Department), Mr. and Mrs. Raynham, Mr. and Mrs. P. Maxwell-Muller, Capt. Green, Lieut. Wilson, Mr. A. Knight (Works Manager), and Mr. R. K. Pierson (Chief Designer).

There were no speeches, but one might almost say that it was a farewell luncheon to Sir A. Whitten Brown, as he is leaving England on Sept. 20th for America, where he will take part in some special flying.

Perhaps the most attractive feature of the proceedings was the exhibition of the Vickers "Vimy" Transatlantic biplane, which had been thoroughly overhauled. Capt. Sir J. Alcock and Lieut. Sir A. Brown, who were given a great reception, were kept busy accompanying visitors to the machine and explaining the functions of the "joy-stick," etc., to them.

COMING EVENTS.

AUGUST.

Amsterdam Aircraft Exhibition. (Still open.)

SEPTEMBER.

Wednesday, September 3rd.—Henlow Recruiting and Repair Depot, R.A.F. Second annual Sports at the R.A.F. Cricket Ground, Henlow.

Wednesday, September 10th.—Schneider Cup Competition, Bournemouth.

Saturday, Sept. 20th.—14 Wing, R.A.F., Italy. Dinner at the Imperial Restaurant, Regent Street, London.

Friday, Sept. 26th.—40 Squadron, R.A.F. Dinner at place to be announced.

DATES TO BE ANNOUNCED LATER.

Hendon-Paris-Hendon Air Race.

The "Daily Express" £10,000 Prize Competitions.

Hendon-Manchester-Hendon Air Race.

Are Motorists Lazy?

A well-known writer says:

"The A.A. is helping to make them so."

"Speaking as one who has never looked for a salute from A.A. patrols, but who has invariably received it, I have always appreciated their unfailing courtesy and willingness even to go out of their way to assist,

and that is, I think, the experience of most road users, but all the same, I confess to a feeling that in wanting to do so much for the motorist in roadside repairs and tyre changing, the A.A. is quite unconsciously helping to make motorists the laziest people on the road."

The above paragraph, taken from a motoring article in a London daily paper, though acknowledging the efficiency of the Automobile Association's Road Service does not do justice to its comprehensive character.

The khaki-clad A.A. patrol also gives reliable road information, warns members of bad road conditions and indicates alternate routes, renders first aid to man and machine, recovers property dropped on the road, procures replacements, and generally assists members in road difficulties.

The Roadside Telephone Service—of which the A.A. was the pioneer and remains the sole provider—includes a telephone installation in each patrol's sentry box which is at the service of any member passing.

Officially appointed A.A. Repairers undertake repairs in an efficient manner and provide replacements at reasonable charges whilst A.A. Hotels can be depended on for accommodation really satisfactory to Motorists.

In addition the A.A. supplies members with special routes to any part of the country and provides Free Legal Defence in any police court in the United Kingdom to answer charges under the Motor Car Act or D.O.R.A.

Whether the above privileges tend to make motorists lazy is a debatable point, but there is no denying the fact that they are of great benefit to and much appreciated by members of the Automobile Association.

If you are not a member of the A.A. send a post card to-day to the Secretary, The Automobile Association, 41, Fanum House, Whitcomb Street, London, W.C.2 for a free booklet and other information which will show you how to motor in comfort and safety.

CIVIL AERODROMES.

The following lists of aerodromes are issued by the Air Ministry as an addition to the lists recently published. It may be seen that in the majority of cases the aerodromes referred to below can only be considered as possible emergency landing-grounds. Attention is again drawn to the fact that these lists are purely provisional and subject to alteration or amendment from time to time.

LIST C (2).

Stations Temporarily Retained for Service Purposes.

It should be assumed that no facilities normally exist at these stations for dealing with civil aircraft. The aerodromes, however, may be considered as emergency landing grounds.

Aerodrome.	Nearest railway station and distance in miles.	Nearest town and distance in miles
BEVERLEY	Beverley (1), N.E.R.	Beverley (1)
BOSCOMBE DOWN	Amesbury (1½), L.S.W.R.	Salisbury (8)
BROOKLANDS	Weybridge (2), L.S.W.R.	Weybridge (2)
CATFIRTH (S)	Thurso, in Scotland, by boat	Lerwick (9), Shetland Isles
CHATTIS HILL	Stockbridge (2), L.S.W.R.	Stockbridge (2)
COLLINSTOWN	Portmarnock (5), G.N.R.I.	Dublin (6)
COVENTRY	Coventry (2), L.N.W.R.	Coventry (1)
CRAIL	Crail (½), N.B.R.	Crail (½)
CRAMLINGTON	Cramlington (1), N.E.R.	Newcastle-on-Tyne (7)
DONCASTER	Doncaster (1), G.N.R.	Doncaster (1)
DRIFFIELD	Driffield (2), G.N.R. and G.E.R.	Driffield (2)
EASTON-ON-THE-HILL	Stamford (3), M.R. and G.N.R.	Peterborough (12)
EAST RETFORD	East Retford (3), G.N.R.	Gainsborough (10)
FELTWELL	Lakenheath (1½), G.E.R.	Brandon (5½)

RENDCOMBE	Foss Cross (2½), M.R. and L.S.W.R.	Cirencester (6)
ROCHFORD	Rochford (1), G.E.R.	Southend (5)
SEATON CAREW	Seaton Carew (1), N.E.R.	West Hartlepool (6)
SEDGEFORD	Sedgeford (1), G.E.R.	Hunstanton (5)
SHAWBURY	Hadnall (3), L.N.W.R.	Shrewsbury (10)
SHOREHAM	Shoreham (1), L.B.S.C.R.	Shoreham-by-Sea (1)
SHREWSBURY	Shrewsbury (1½), G.W.R.	Shrewsbury (1)
TADCASTER	Thorrer (2), N.E.R.	Tadcaster (4)
TERNHILL	Ternhill (2), G.W.R.	Market Drayton (5)
THETFORD	Thetford (2), G.E.R.	Thetford (2)
THROWLEY	Charing (4), S.E.C.R.	Faversham (6)
UPPER HEYFORD	Lower Heyford (2), G.W.R.	Bicester (6)
WADDINGTON	Waddington (1½), G.N.R.	Lincoln (5)
WESTGATE (S)	Westgate (¾), S.E.C.R.	Westgate-on-Sea (¼)
WHITLEY ABBEY	Coventry (2), L.N.W.R.	Coventry (2)
WITNEY	Witney (2), G.W.R.	Oxford (12)
WITTERING	Stamford (3), G.N.R. and M.R.	Peterborough (10)
YATESBURY	Calne (5), G.W.R.	Marlborough (9)

LIST D (a).

Aerodromes Licensed for all but larger types of Aircraft.

YEOVIL	Yeovil (1½), G.W.R. and L.S.W.R.	Yeovil (½), Somerset.

LIST D (b).

Aerodromes Licensed as suitable for "Avro 504 K and similar types of aircraft" only. Except in a very few instances accommodation does not exist. The licences have also been issued for limited periods only.

Aerodrome.	Nearest railway station and distance in miles.	Nearest town and distance in miles
ABERYSTWYTH	Aberystwyth (½), G.W.R.	Aberystwyth (½), Cardigan.
CHESTERFIELD	Chesterfield (2), M.R.	Chesterfield (2), Derby.
CONWAY	Conway (1), L.N.W.R.	Conway (1), Carnarvon.
DERBY	Normanton (1½), M.R.	Derby
HERNE BAY	Herne Bay (1), S.E.C.R.	Herne Bay (½), Kent.
NOTTINGHAM	Nottingham (2), M.R., G.N.R., and G.C.R.	Nottingham

Situated on Sands Not Available at High Tide.

HUNSTANTON	Hunstanton (½), G.E.R.	Hunstanton (½), Norfolk.
LLANELLY	Llanelly (1), G.W.R.	Llanelly (½), Carmarthen.
RAMSEY, I.O.M.	Ramsey (½), I.O.M.	Ramsey (½), I.O.M.
ROTHESAY, ETHERICK BAY	By boat to mainland	Rothesay (4), Isle of Bute.
SOUTHPORT	Southport (1), L.Y.R.	Southport (½), Lancs.
SWANSEA	Swansea (1), G.W.R.	Swansea (½), Glamorgan.
WESTON-SUPER-MARE	Weston-super-Mare (½), G.W.R.	Weston-super-Mare (½), Somerset

ROLLS ROYCE

WARNING

Changes to Rolls-Royce Cars

Rolls-Royce Ltd. have recently learned that attempts are being made by certain persons to "bring up to date" pre-war Rolls-Royce chassis by substituting for Rolls-Royce Springs of old type cantilever springs which are not of Rolls-Royce manufacture; also by substituting other radiators and bonnets which are not of Rolls-Royce manufacture. Some of these changes have been brought to the attention of the Company, who have found them to be not only unsatisfactory but possibly dangerous to the users. Owners who are asked to have such changes made to their Rolls-Royce cars, or potential purchasers of Rolls-Royce cars on which such changes have been made or may be suspected, should communicate with Rolls-Royce Ltd., 15, Conduit Street, London, W.1, and the Company will, for a small fee, inspect the chassis in question and inform the applicant what parts, if any, are not supplied by Rolls-Royce, and what the effect of such parts in their opinion is likely to be. Furthermore, any such alterations which interfere with or depart from Rolls-Royce standards will probably put the car out of action for an indefinite period in cases of accident or breakage, as Rolls-Royce new parts cannot be expected to replace foreign broken parts in a "bedevilled" chassis.

ROLLS-ROYCE Ltd., 14 & 15, Conduit Street, London, W. 1.

LIST E.

Stations No Longer in Use by the R.A.F.

These stations have been passed to the Government Surplus Property Disposal Board. They will be relinquished as soon as the Government property thereon has been disposed of. In many cases the aerodromes are now under cultivation, but it is probable that the sites still form the best emergency landing grounds in the immediate neighbourhood.

AN AERODROME FOR SALE.

It is announced that the Ford aerodrome near Littlehampton, Sussex, is for sale as an aerodrome. It covers 167 acres, and has accommodation for three squadrons.

The Disposal Board of the Ministry of Munitions states that the buildings are of brick and timber. Water and electric power have been provided, the roads have been macadamised, and there is railway connection. The site is occupied by the Government under the Defence of the Realm Regulations, but can, if necessary, be purchased under, and subject to, the provisions of the Defence of the Realm (Acquisition of Lands) Act, 1916. Further information can be obtained at Charing Cross Buildings, London, W.C.2.

THE SALE OF BRITISH AIRSHIPS.

The Air Ministry announces that in view of the decision of the Government to curtail their airship programme, it has been decided to place certain airships, airship stations, stores, etc., on terms to be agreed, at the disposal of interested parties with a view to the commercial development of this type of aircraft. It is proposed as an initial step to hold a conference in connection with this matter on September 8th, at 3 p.m., in the Lower Hall, Australia House, at which the Under Secretary of State for Air will preside.

Bona fide applications from individuals or firms should be made to the Air Ministry (C.G.C.A.) for permits to be present.

AIRCRAFT FINANCE

Lloyd's and Aviation Methods.

Just now the sceptics are elated. Doubtless they magnify the deficiencies of the present-day aeroplane as an economically sound commercial proposition, as the unsullied enthusiasts exaggerate its capabilities. In both cases one can diagnose mental astigmatism.

Possibly the enthusiast is to be blamed equally as much as the sceptic, if not more so. Any way, it is maintained that commercial aviation is metaphorically trying to jump before it has learned how to walk.

Landing-Grounds Every Ten Miles.

On all long-distance aerial trade routes there should be landing-grounds every ten miles. These fields need not be exclusively devoted to aviation. They need not be owned by the aerial transport company or companies. So long as they are not under crop, but are used for cattle and sheep and physically conform to the requirements of grounding an aeroplane, they would serve the purpose excellently well.

Separated at intervals of ten miles in a defined aerial route, say, between London and Paris, they would be marked so as to be observable from "up above." Therefore, in the event of engine trouble or anything necessitating a forced landing, the pilot would be able to act with precision and without risking his own life and machine, etc., in a precipitate descent on unsuitable ground.

The Cost Would Not Be Large.

The cost would be trivial; in many cases it would not exceed a nominal rental. The effect would be beneficial because pilots, being acquainted with the existence of these reserved landing-grounds, would be more confident. This greater sense of security would obviously stimulate business, and insurance charges would be reduced automatically.

At first sight the idea may seem preposterously cautious; however, it is nothing of the sort. Great advances have been made with aero-engines, but, as everyone must candidly admit, they are not perfect, and frequently go wrong without warning.

The Registration of Navigators.

And there is another aspect of present-day commercial aerial transport that calls for serious consideration. It is the human factor. Quite true, there are regulations governing pilots and navigators; but, if one is to believe certain competent authorities connected with Lloyd's, such regulations are really of no intrinsic value.

Lloyd's—that is to say, those underwriters who specialise in aviation risks—demand a more business-like and scientific scheme regulating aerial navigators. They want something equal to the Board of Trade control over the officials of the mercantile marine. Having regard to the age of the new industry, perhaps they are asking too much. At the same time it must be admitted that the qualifications of a first-class fighting man are not necessarily those needed for an ordinary commercial venture.

A High Level of Intelligence.

What is wanted is a system of registration based on all that is known of the science of aviation. In order to secure the right to navigate a commercial aeroplane, the pilot must prove his competency by examination, as is the case with officers of the mercantile marine.

It is not fair, perhaps, to draw a strict comparison with the mercantile marine system; the aircraft pilot is half an engineer and half a navigator, whereas the two classes are quite distinct in the mercantile marine. This is a point that is overlooked by many people, who fail to recognise that, in order to obtain full qualification, the airman must be no ordinary person, but a bit of a scientist too.

In demanding an up-to-date system Lloyd's is thinking as much of its own interests as of the future of commercial aviation. Of course, as the losses diminish, the premiums on aviation risks must be reduced correspondingly, which is a goal worth striving for.

W. J. Davis.

CURRENT TOPICS.

Whitehead Aircraft, Ltd.

In pursuance of the provisions of the Companies (Consolidation) Act, a meeting of the creditors of the above was held on August 15th at the Cannon Street Hotel, London, E.C. The Chair was occupied by Mr. O. Sunderland, of the Automobile Trades Guardian Association, 15, Eastcheap, E.C.

The Chairman said it would be recollected that the company had passed resolutions in favour of voluntary liquidation and he had been appointed to act as liquidator to represent the interests of the creditors, while Mr. Oldham had been appointed to act with him to watch the interests of the shareholders. Meetings of the creditors had previously been held, at which figures from the last balance sheet of the company were presented. That balance sheet showed assets of £1,041,258, made up as follows: freehold and leasehold land and buildings, plant, machinery, fixtures, motor-cars, lorries, tools, jigs, flying-school equipment and goodwill as acquired from the vendor company with additions to date, less depreciation written off, £634,063; furniture, utensils, improvements, equipment and horses at cost with additions to date less depreciation written off, consumable stores and farm stock as valued by the company's officials £22,188; stock-in-trade and work in progress as valued by the company's officials £242,629; sundry debtors £54,855; amount due in respect of property sold with interest accrued thereon secured by second mortgage debenture £17,456; cash in hand £438; sundry unexpired portions of insurance, etc., £1,554; commission on shares issued £35,625; preliminary expenses £32,451.

On the liabilities side of the balance sheet were the following: share capital issued £518,697, less calls in arrears £1,652, leaving the net amount of issued capital at £517,044; first mortgage debentures and interest accrued thereon £147,015; advances by H.M. Government with interest accrued thereon secured by second mortgage debentures £203,009; cash due to bankers £10,301; sundry creditors £125,312; liquidator of Whitehead Aircraft, Ltd., £6,780; premiums on shares issued £21,310, and balance from profit and loss account £10,382. The authorised share capital of the company was £1,000,000, divided into 300,000 preference shares of £1 each, 650,000 ordinary shares of £1 each, and one million deferred ordinary shares of 1s. each.

Mr. Sunderland recalled the fact that two earlier meetings of the creditors had been held, when a committee was appointed to represent the interests of the creditors. That committee had suggested that the company should go into voluntary liquidation. He, as the chairman of the committee, was nominated as one of the liquidators to represent the interests of the trade creditors. Meetings of the shareholders were subsequently held, under the presidency of Lord Wemyss, when resolutions for the voluntary liquidation were carried by a very large majority. At the confirmatory meeting of the shareholders the resolutions were agreed to with practical unanimity. A petition for the compulsory winding up of the company had been presented, and had been before the Court on three occasions. He thought he could say that there was very little prospect indeed, judging from the remarks of the judge, of the petition succeeding. After the first meeting of the creditors at the First Avenue Hotel, the committee decided that they should get into communication with Mr. Ambrose Taylor, of the Cosmos Consolidated, Ltd., who negotiated for the taking over of the whole of the undertaking of the company at a figure which would allow of the creditors all being paid in full, while arrangements would also be made for the preference and ordinary shareholders in the concern to get something. Mr. Taylor had been given every facility to go down to the works of the company in order to make his own valuation of the assets for the purpose of making his offer. Within two or three days at the latest Mr. Taylor would

	Arr. London ...	3.10	

* On Thursday the passengers and goods on this service were diverted to an alternate route because the wind was blowing in gusts at hurricane strength; rain was descending with torrential force, and masses of clouds were within 100 feet of the ground.

The attention of Bankers, Merchants, and firms who have houses both in London and Paris is drawn to the unique facilities afforded by the service, which will permit passengers, urgent documents, or express goods to be transported the 250 miles between London and Paris in an average time of 2¼ hours. The service, which has just been operated daily through a week of most tempestuous weather, has been started in order to demonstrate that, with the use of skilled pilots and fast machines, such an express air service can now be run with sufficient reliability to afford a definite, daily convenience to the business world.

LONDON:
AIRCRAFT TRANSPORT & TRAVEL, LTD.,
27, Buckingham Gate, S.W.1.

PARIS:
COMPAGNIE GÉNÉRALE TRANSAERIENNE,
118, Champs Elysee,

Full particulars regarding Rates and Freights can be obtained from Aircraft Transport & Travel, Ltd., 27, Buckingham Gate, S.W.1., or from American Express Co., Queen Street and Haymarket; Thos. Cook & Son, Ludgate Circus, E.C.; General Transport, Ltd., 52, Crutched Friars; J. Jackson & Sons, 7-8, Charing Cross; Henry Johnson & Sons, 18, Byward Street; Lepaerial Travel, Piccadilly Circus (Criterion corner); Carter Patterson & Co., 6, Maddox Street, W., and 3, Cannon Street, E.C.; and Hernu Peron & Co., 98-100, Queen Victoria Street, E.C.

be making his offer. The latter would undoubtedly be one that would allow of all the creditors being paid in full.

A creditor asked how much was due to creditors at the present time, and Mr. Sunderland said that the amount due to the creditors was in the neighbourhood of £60,000. The liabilities shown in the balance sheet included the issued share capital of the company. The amount due to the debenture holders was £143,000, while £60,000 was owing to the Ministry of Munitions. The assets shown in the balance sheet were in excess of a million sterling.

Mr. A. Houston said he understood that a receiver had been appointed to act on behalf of the debenture holders. He inquired if the receiver was well disposed towards the creditors, and pointed out that if he was not he might have power to wreck any scheme.

Mr. Sunderland said the debenture holders were the Investment Registry, whose claim amounted to more than £140,000, and it was at the suggestion of the committee of the creditors that a receiver was appointed. The committee recommended that that course should be followed in order that the assets might be protected as proceedings had been commenced against the company.

Mr. Houston asked if more than one petition had been presented to the Court, and the chairman said it would be recollected that one of the petitioning creditors had already intimated that he would work with the other creditors in the matter. He suggested that the meeting should agree to an application being made to the Court for the appointment of a Committee of Inspection, and that the committee should also have power to apply for a supervision order. If a supervision order was made that would be a direct answer to any petition that was presented.

Mr. E. H. Hawkins (Messrs. Poppleton, Appleby and Hawkins) said it was not an ordinary meeting of creditors as they were all to be paid in full. He proposed a resolution confirming the voluntary liquidation of the company with Mr. Sunderland and Mr. Oldham as liquidators, and the appointment of a Committee of Inspection consisting of the representatives of the Palmer Tyre Co., Austers, Ltd., Matthews and Yates, Falcon Airscrew Co., and Bruntons and Co. Power was also given for an application being made to the Court for a supervision order.

The resolution was duly seconded and carried unanimously.

VOLUNTARY LIQUIDATION.

Nicholson and Lord, Ltd., aeroplane manufacturers, etc., Walsall, Staffordshire.

The creditors herein were called together on Aug. 26th at the Institute of Chartered Accountants, Moorgate Street, E.C. The Chair was occupied by Mr. T. G. Mellors, C.A., of Nottingham, who stated that he had been appointed to act as the liquidator in the voluntary liquidation of the company. He added that there were three businesses carried on, and it was extremely difficult to ascertain the liabilities and assets of the different concerns. He had, therefore, included all the assets and liabilities of the three businesses in the statement of affairs. The statement showed unsecured liabilities of £20,577, while there were fully secured creditors for £14,999.

The securities held were estimated to realise £32,830, or an apparent surplus of £17,830. In addition, there were contingent liabilities of £155,000, but, at the moment, it was impossible to estimate what portion would rank for dividend. The assets were estimated to realise £34,752, from which had to be deducted £602 for preferential claims, leaving net assets of £34,149, or a surplus as regarded the unsecured creditors of £13,572.

The issued share capital of the company was £60,000, and as regarded the contributories there was a deficiency of £46,427. The principal secured creditors were Messrs. John Dawson and Co. (Newcastle), Ltd., who claimed £12,000 in respect of certain bills and cash advanced. Lieut.-Gen. Sir Arthur Sloggett was also a secured creditor for £2,000, for money lent. The contingent liabilities were in connection with large orders which had been placed in this country and America for the supply of goods, some portion of which had been delivered. During the year ended June, 1916, a profit was made of over £700, but in the following 12 months there was a loss of about £4,000. Messrs. John Dawson and Co. (Newcastle), Ltd., had financed the business.

A proposal seemed to have been made for the present concern, John Dawson and Co. (Newcastle), Ltd., and some other concerns to be amalgamated into one large company, but that had not taken place. The company of Nicholson and Lord, Ltd., was only registered on April 30th of the present year, and the agreement for the sale of the business to the company was dated May 14th, 1919. The consideration for the transfer of the business to the company was £60,000, which was discharged by the issue of shares, and the company agreed to discharge the liabilities and take over the assets. The creditors decided that an application should be made to the Court for the appointment of Mr. G. G. Poppleton, of Messrs. Poppleton, Appleby and Hawkins, 4, Charterhouse Square, E.C., and Birmingham, and Mr. A. C. Vincent, of 13, Queen Street, E.C., to act as joint liquidators in the winding-up of the company with Mr. Mellors. A committee of three of the principal creditors was also nominated.

To "Aeroplane" Subscribers.

HOW TO SAVE ONE GUINEA, EIGHT SHILLINGS & NINEPENCE OR SEVEN & SIXPENCE.

The subscription list of the AEROPLANE, both at home and abroad, is steadily increasing: an eminently satisfactory movement which we are anxious to encourage.

Of the many books published on the war on the Western front, none conveys a more realistic impression of the work of a particular arm than FLYING COLOURS by Captain H. M. S. Saundby, M.C., A.F.C., R.A.F., published at **£2 2s.** net (Edition de luxe) and **15/-** net (Popular Edition).

Among the art books published in the last year or two, none can claim to be a more faithful reproduction of the artist's colour scheme and that indefinable thing, atmosphere.

FLYING COLOURS is a permanent memorial of the life of "the pilot in action," as Major-General C. B. Ashmore calls him. It was very costly to produce, and necessarily the price to the public had to be high.

Many would like to possess it who do not feel disposed to put down Two Guineas for the larger edition or Fifteen Shillings for the smaller.

How to meet their views? We make a special offer to any subscriber for one year to the AEROPLANE: namely to give him the right to purchase either edition at half price.

All he need do is to send us the accompanying order form with cheque for one year's subscription, plus **£1 1s.** or **7s. 6d.** according to the Edition he wishes to have.

In order to be fair to current yearly subscribers we extend the half-price concession to them also. If a subscriber has paid a quarterly or half-yearly subscription, then to secure the right to participate he should send the balance for the year.

Subscribers who have given their orders through the trade, and not direct to the AEROPLANE Office, must sign the form below or a copy thereof, and hand it with the balance on account of the book to their retailer for transmission to the AEROPLANE.

If the subscriber already has a copy of FLYING COLOURS, and would wish to take advantage of this offer, then he may secure McCudden's "Five Years in the R.F.C." **(7s. 6d.)**; Richthofen's "Red Air Fighter" **(3s. 6d.)**, and Gill's "The Aerial Arm" **(6s. 6d.)** at half price, *i.e.* **8s. 9d.** the three, plus the year's subscription to the AEROPLANE.

Subscribers who take advantage of this offer will have no reason to complain of the cost of their books.

ORDER FORM.

To THE "AEROPLANE,"
61, Carey Street, W.C.2.

Please send me the "AEROPLANE" or one year post free **(30/- inland ; 35/- abroad** and one copy of the { Edition de luxe / Popular Edition } of FLYING COLOURS at half price { **£1 1s. 0d.** / **7s. 6d.** } for which I enclose remittance value **£ s. d.**

Condition

That's the point!

How is your Engine's Pulse!

You know the first thing the Physician does when he wants to find your general condition—he feels your pulse! If he finds you are in a state of lethargy he prescribes the best tonic—a thorough change.

Moral: If your Engine is feeble and run-down and you can't trace the cause—We can! We know all about it and can renew its pulse—not temporarily, but for all time—and put new life and vigour into the whole system. We have cured thousands of cases of this sort and always succeeded in prolonging the life and service of every patient.

It will pay you best to take advantage of our experience. Let us estimate for anything and everything you require in engines.

Overhauling and Repairing

Steam and Petrol — Land, Air, Marine.

In special cases we will send expert engineers and appliances on receipt of request.

Cars Renovated & Repaired

Paintwork, Upholstery, Coach Building in all branches.

Cars Collected at our London Depot,

31, Brook St, Bond St., W.

(Cyril T. Chamberlain, London Manager),

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

In a leading article Captain Sayers discusses some possibilities of the man-powered aeroplane, and suggests a new sport which may lead to considerable additions to the present knowledge of atmospheric conditions.

The machines built and projected by the Nieuport and General Aircraft Co. are dealt with in this week's instalment of "Modern British Aeroplanes."

The article upon the work of the American "Altitude Laboratory" is continued. The result of a series of tests on a Hispano-Suiza engine under conditions which correspond to altitudes of up to 30,000 ft. are given. These results are of very great value, and should enable aeroplane designers to estimate, with greater confidence than heretofore, the performance of projected machines at high elevations.

A note and some illustrations, by "Anglo-Dane," give interesting information as to the use of aircraft for civil purposes in Germany, and to the methods adopted to convert war-type machines to that purpose. These methods, it is interesting to note, differ in no way from those practised in this country.

A PROMISING FIELD FOR EXPERIMENT.

By Capt. W. H. SAYERS, late R.A.F.

The daily news-sheets have lately given a considerable amount of space to the feat of the French racing cyclist Poulain, who has succeeded in making a flight of 12 metres upon a flying bicycle.

The idea of the man-propelled flying machine is of great antiquity—there can be little doubt that even prehistoric inventors have come to happy ends in attempts at man-propelled flight—and since the advent of the aeroplane many and wondrous attempts have been made to solve the problem.

So far, most of these have been the work of uninformed enthusiasts carried away by the idea that the secret of flight was to be discovered with the aid of some new mechanism, and the subject has received little consideration from practical aeronautical engineers.

A Question of Speed and Power.

It is well worth while devoting a little time to an elementary investigation of what is and what is not possible. The whole problem is essentially one of power, weight, and speed.

An efficient modern aerofoil may have a ratio of lift to drag of 20 to 1 at its most efficient altitude.

An efficient modern aeroplane complete might reach a gliding angle of nearly 1 in 10.

Allowing for the fact that any aviette, or man-powered aeroplane, must be a slow-speed machine, and that at low speeds, owing to the effect of what are commonly known as "scale corrections," the ratio of lift to drag becomes lower, and that, on the other hand, the man-motor will not require either air or water cooling, and need not, therefore, be burdened with the head-resistance of radiators or their equivalent, it may safely be assumed that an aviette can be built with a gliding angle of at least 1 in 8.

Thus the thrust which must be exerted to maintain level flight under the conditions of minimum resistance is ⅛ of the total weight of the machine and the man.

Therefore the useful power required to maintain flight is equal to $\frac{W \times V}{8}$ ft.-lb. per sec., where W is the total weight and V is the speed of flight in feet per second.

This is at the rate of 0.023 h.p. per 100 lbs. of total weight per foot per second air speed.

The total horse-power which a man can exert is a very variable quantity. Under certain conditions, as running up a flight of stairs, a man may exert nearly 1½ h.p. for a short time. Some short-distance sprint cyclists can undoubtedly exceed this output considerably for 20 sec. or so.

No man can continuously exert 1 h.p. for any long time. Possibly some road-racing cyclists in the best of their form might maintain that power for half an hour or so, but very few men could go on working at any rate over ½ h.p. for an hour. Some very crude experiments made by the writer before the war, on a pedal-cycle turned into a dynamometer, indicated that to get the maximum power output from the cycle-pedalling movement required a very accurate gear adjustment, and that this adjustment varied greatly with the individual and with the conditions.

This is in accord with cycling experience, and the gear which will enable a man to give the maximum continuous output will not allow of his developing his greatest possible output during a few seconds.

If one assume that a man may give ½ h.p. for some appreciable time, and that a man-driven airscrew may develop 60 per cent. efficiency, the product of the total weight which he can support in the air and of the speed at which it is supported will be $\frac{1 \times 550 \times 60 \times 8}{2 \times 100} = 1{,}320$ at a gliding angle of 1 in 8.

The Possibilities.

That is, he might just support 1,300 lb. at 1 ft. per sec., or 650 lb. at 2 ft. per sec., or 130 lb. at 10 ft. per sec.

Even 10 ft. per sec.—about 7 miles per hour—is too

slow an air speed to be practicable. With a gliding angle of 1 in 8 it would not be possible to support much more than 1 lb. for every 4 sq. ft. of wing surface at this speed. As the permissible total weight at that speed is less than that of the average man, flight under these conditions seems impracticable.

Taking, however, the case of an athlete in good condition, capable of exerting, say, 1½ h.p. for a minute or so and 1 h.p. for half an hour, he would be able to keep a 200 lb. machine in level flight at 13 ft. per sec. for an appreciable time, and get a machine of the same weight to just fly at 20 ft. per sec. for a short time.

Now, at 20 ft. per min., the postulated gliding angle of 1 in 8 could probably be reached with a load of 1 lb. per sq. ft., or a machine of 200 sq. ft. and 200 lb. loaded weight; and if a 200 sq. ft. machine can be built for a total weight of 50 lb., a 150 lb. man might be just able to fly on it at 20 ft. per sec. for a few minutes.

It is not impossible to build a 200 sq. ft. glider for a total weight of 50 lb., even including a pedal gear and airscrew. Such a machine would not have the factor of safety demanded from the constructors of modern war machines, but then it will scarcely need it.

The figures which have been given are, of course, very rough estimates of what is possible—they are rather conservative if anything—and they show that, given careful design, it should be possible for a man to maintain himself in the air, for a short time and at a low air speed, by his own exertion. At the first glance this would seem to indicate that there is little use in pursuing the subject, except purely from a sporting point of view.

This, however, is not an entirely correct interpretation.

Soaring.

Most people who are in any way interested in aeronautics have heard of soaring flight. Many of them—even amongst those resident in this country—have seen the phenomenon and have watched birds holding their position, and even rising to a very considerable height—one sufficient to allow of a glide of several miles before landing—under favourable conditions, particularly in fairly hilly country.

It is also fairly well known that soaring flights have been made by man-carrying gliders, and that the accumulated evidence of experience with gliders, power-driven aeroplanes, and of that obtained from the observation of birds, show that soaring flight is undubitably—in the majority of cases—a phenomenon associated with rising currents of air.

Soaring flight of this type can only occur when the rate of ascent of the air current is equal to or greater than the minimum speed of descent of the aircraft.

The speed of descent of an aeroplane which has a gliding angle of 1 in 10 at a speed of 60 m.p.h. (88 ft. per sec.) is 8.8 ft. per sec., and at that speed and gliding angle it cannot soar in an up current of less vertical velocity than 8.8 ft. per sec. Up currents with this velocity are scarce in this climate, except as momentary occurrences, and soaring flight in such an aeroplane is therefore impracticable.

A man-powered aeroplane with a gliding angle of 1 in 8, at 20 ft. per sec., could soar in any up current whose vertical velocity exceeded 2½ ft. per sec.

There are grounds for believing that upward currents of fair extent and reasonable steadiness of about this velocity are not uncommon in England, and that soaring flight in such a machine would be quite possible under the conditions in which birds are found to soar with fair regularity.

Attempts to soar in a non-powered glider have never been conspicuously successful. Generally the evidence points to suitable air conditions occurring only over ground unsuitable for taking off and landing on with a glider.

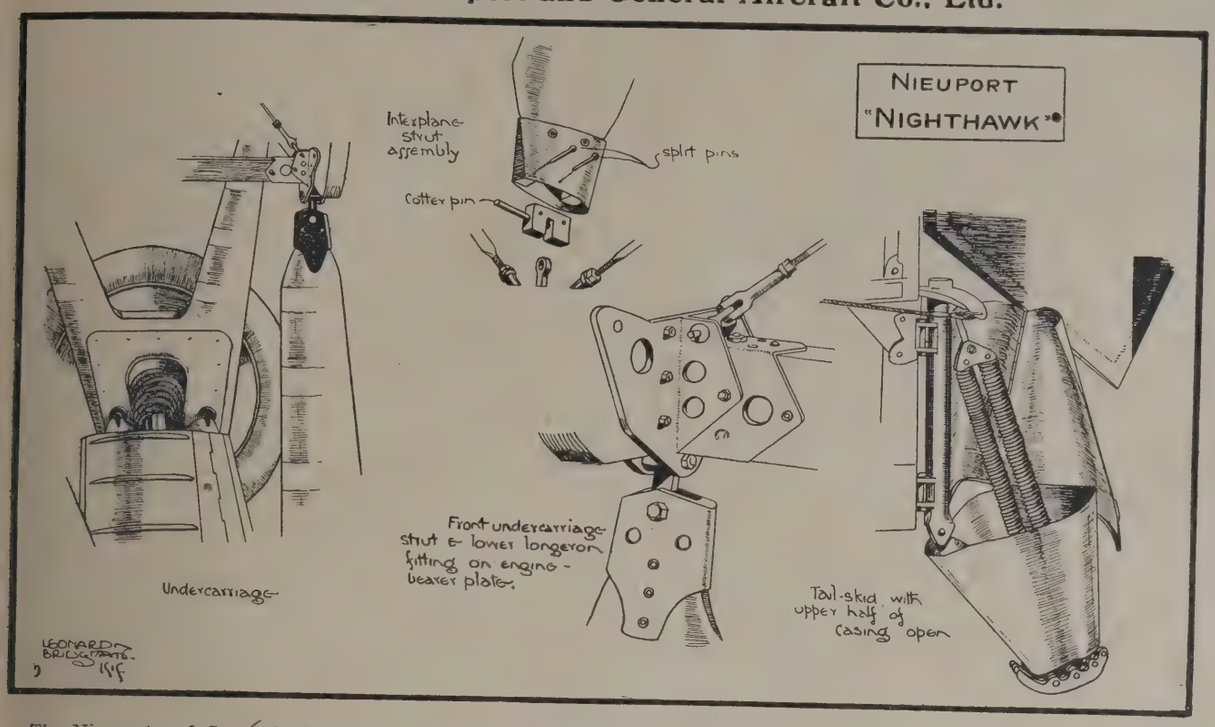
On the other hand, there are many places in this country, and many more in some others, where it would be quite possible to take off on the top of fairly high ground and reach a landing ground in a valley below upon any reasonably controllable and fairly low speed glider, and where it would be possible, if one were able to fly level, or nearly level, after taking off, for half a mile or so, to reach positions where birds are known to soar without going out of gliding range of the landing ground.

Thus just that capacity which the aviette promises would be of immense help in investigating the possibilities of soaring on very lightly loaded aircraft, and such an investigation might lead to really useful results.

Any really successful solution of the soaring-flight problem has obvious possibilities from the sporting point of view, and even this aspect promises a very fair return for the expenses of experimentation.

Under certain conditions there might be a commercial value attached to this form of locomotion, but, over and above these possibilities, an aeroplane capable of soaring would be an extremely useful instrument for exploring the air and investigating the very complex local disturbances which occur therein.

A New Sport.



In its early stages "soar-hunting" will probably be a fairly dangerous pastime, but in the present state of aeronautical engineering, and with the enormous number of skilled pilots who are seeking for an outlet for their abilities, it should be possible to carry out a large amount of experimental work in this direction at a risk much smaller than that which attended the efforts at power flight of ten years ago.

The "Airco" 16—a DeH9a re-designed for passenger-carrying.

MODERN BRITISH AEROPLANES.

XIII.—The Nieuport and General Aircraft Co., Ltd.

The Nieuport and General Aircraft Co., Ltd., was founded some time prior to the outbreak of the late war mainly to build Nieuport designs in this country.

During the earlier part of the war the company came under the management of Major Heckstall Smith, who had been Assistant Superintendent of the Royal Aircraft Factory and Farnborough, and it has since then acquired from that establishment most of the more competent of the early technical staff thereof.

Of the products designed by the Nieuport Company since this occurred the Nieuport "Nighthawk" is the best known, but a number of other designs of the same origin are well worthy of attention.

THE NIEUPORT "NIGHTHAWK."

The Nieuport "Nighthawk" was designed in October, 1918, by the (British) Nieuport and General Aircraft Co., Ltd., to meet the requirements of the first R.A.F. Type 1 specification for the 1919 programme and was officially accepted from six other competitive designs. It was naturally intended primarily as a fighting scout, and as such was equipped with two fixed Vickers guns firing through the propeller, but owing to the cessation of hostilities it can now be supplied as a commercial or fast mail carrier, the space which would ordinarily have been taken up by ammunition boxes and chutes, in front of the pilot, being replaced by a compartment capable of holding a dead weight load of from 180 to 200 lb.

In general design the machine is a single-seater biplane fitted with a 320-h.p. A.B.C. "Dragonfly" engine.

The fuselage is built up in the customary manner of four one-piece longerons, cross strutted, and wire-braced throughout, fitting at the front end into special box fittings on the 11-ply engine bearer-plate and terminating at the rear at the rudder post. The fuselage is streamlined throughout its length by means of formers and bearers, over which the fabric is placed.

The engine is bolted direct to the engine bearer plate and as an additional precaution four tubular stays are fitted, running from the front edge of the crankcase to a fitting on the front of the engine bearer plate corresponding to the longeron fitting on the opposite side of the plate.

The pilot's seat is situated under the trailing edge of the upper plane, and on either side of the fuselage on the streamline are carried the two main petrol tanks capable of holding 17 gallons each which are held in place by steel bands. An additional tank is carried on the centre section which holds 6 gallons, making a total of 40 gallons or sufficient fuel for a flight of 3 hours at 20,000 feet.

Above the fuselage in the streamlining are carried the two fixed Vickers guns under which are the fibre ammunition boxes and chutes.

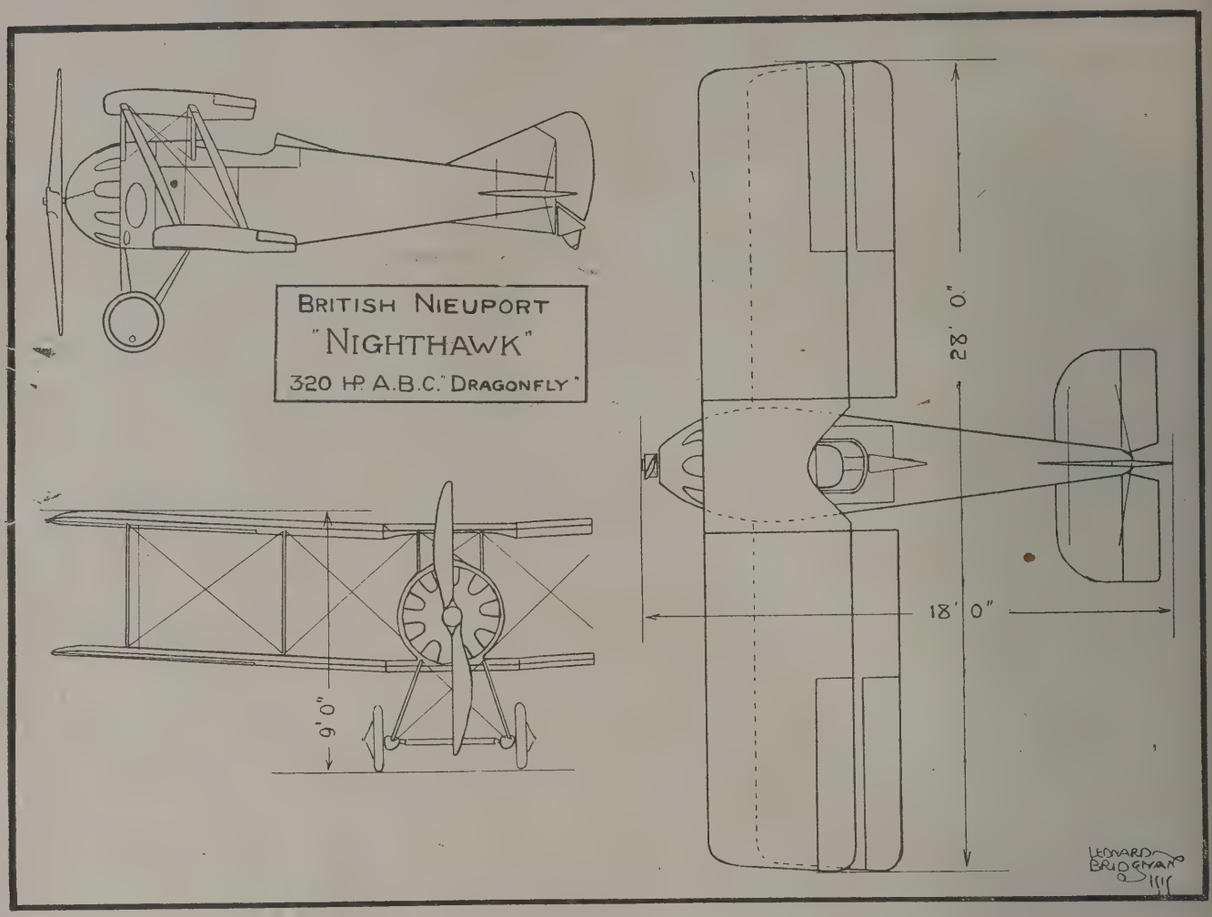
On the left-hand side of the pilot's cockpit is situated the tail plane operating gear, which consists of a continuous cable running over three pulleys, one on the left-hand side of the fuselage in the pilot's cockpit, and the other two on threaded spindles on two upright members immediately in front of the leading edge of the tail plane. Attached to the leading edge of the tail plane are two internally-threaded collars working on the spindles, which give vertical motion to the leading edge of the tail plane on forward and backward action of a vertical lever which is anchored to the cable in the pilot's cockpit.

The elevators are fixed to a single tube running through the fuselage and have a central operating lever, the hinges consisting of four steel bands running round the tube.

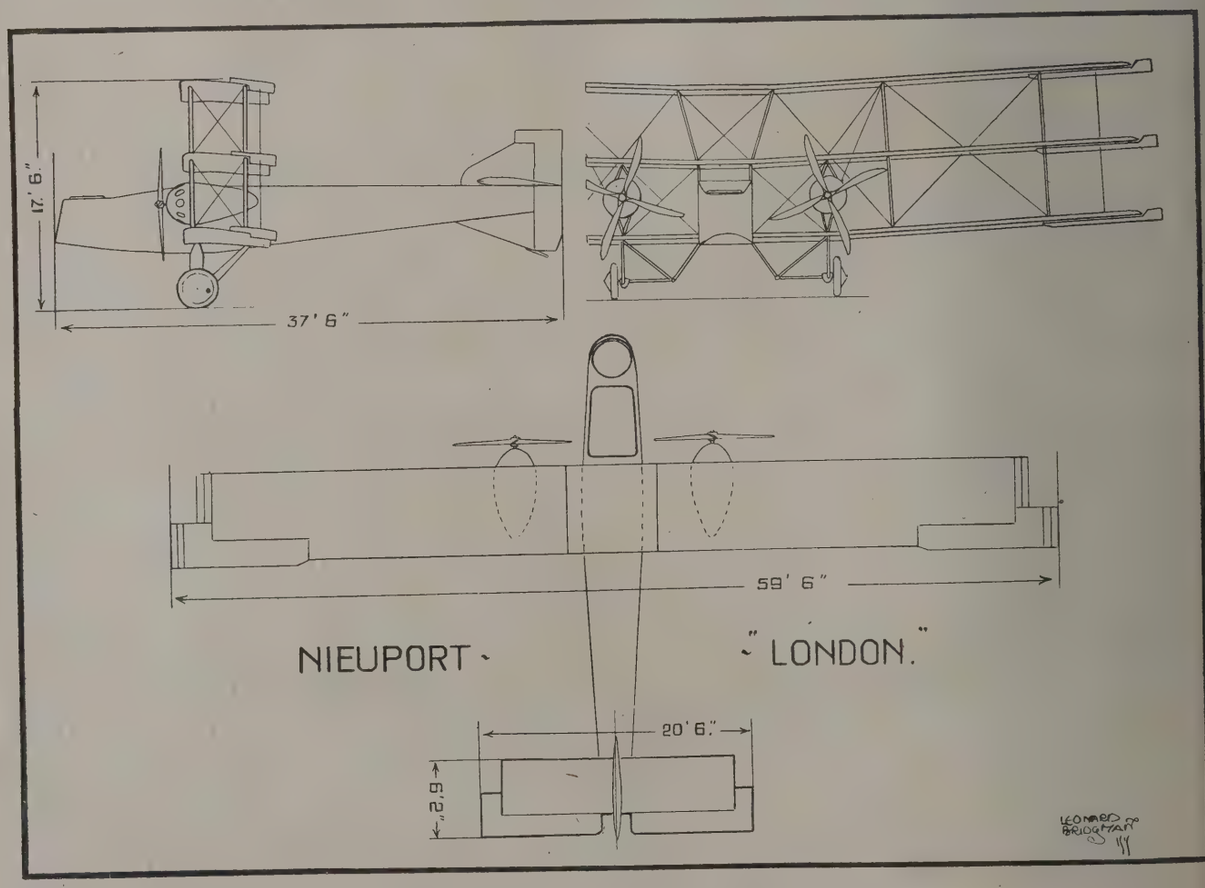
The rudder is balanced and there is fin area both above and below the fuselage. The tail skid is similar to the type employed in the SE5 and SE5a and is illustrated by a sketch.

The main planes possess no outstanding constructional features, being built up in the usual manner. Small transparent panels are inserted in the plane covering over all aileron pulleys, thereby facilitating inspection.

Two sets of interplane struts are fitted on each side of the fuselage. Ailerons are fitted to the upper and lower planes and are operated in the usual manner. The wing bracing throughout is of Rafwire, all flying wires as well as the landing wires in the inner bay being duplicated.



The undercarriage is of the usual Vee type, the Vees being braced at the apex by two cross struts, the axle being slung between on rubber shock-absorbers. The axle and cross-struts are enclosed in streamline fairing.



A two-seater edition of the "Nighthawk" is also being produced, the passenger being situated in front of the pilot. It can either be supplied as a dual-control very advanced training machine or purely as a passenger carrier with one set of controls.

It was one of these machines, one believes, that, converted to a single-seater by having the passenger seat covered in, put up such a creditable performance in the last Aerial Derby.

SPECIFICATION (2-seater).

Type of machine	British Nieuport 2-seater biplane
Name or type No. of machine	2-seater "Nighthawk"
Purpose for which intended	Training or Commercial
Span	28 ft.
Gap	4 ft. 6 in.
Overall length	18 ft.
Maximum height	9 ft.
Chord	5 ft. 3 in.
Total surface of wings	276 sq. ft.
Span of tail	9 ft.
Total area of tail	28 sq. ft.
Area of elevators	10 sq. ft.
Area of rudder	5.3 sq. ft.
Area of fin	5.2 sq. ft.
Area of each aileron and total area	9.3 sq. ft.—37.2 sq. ft.

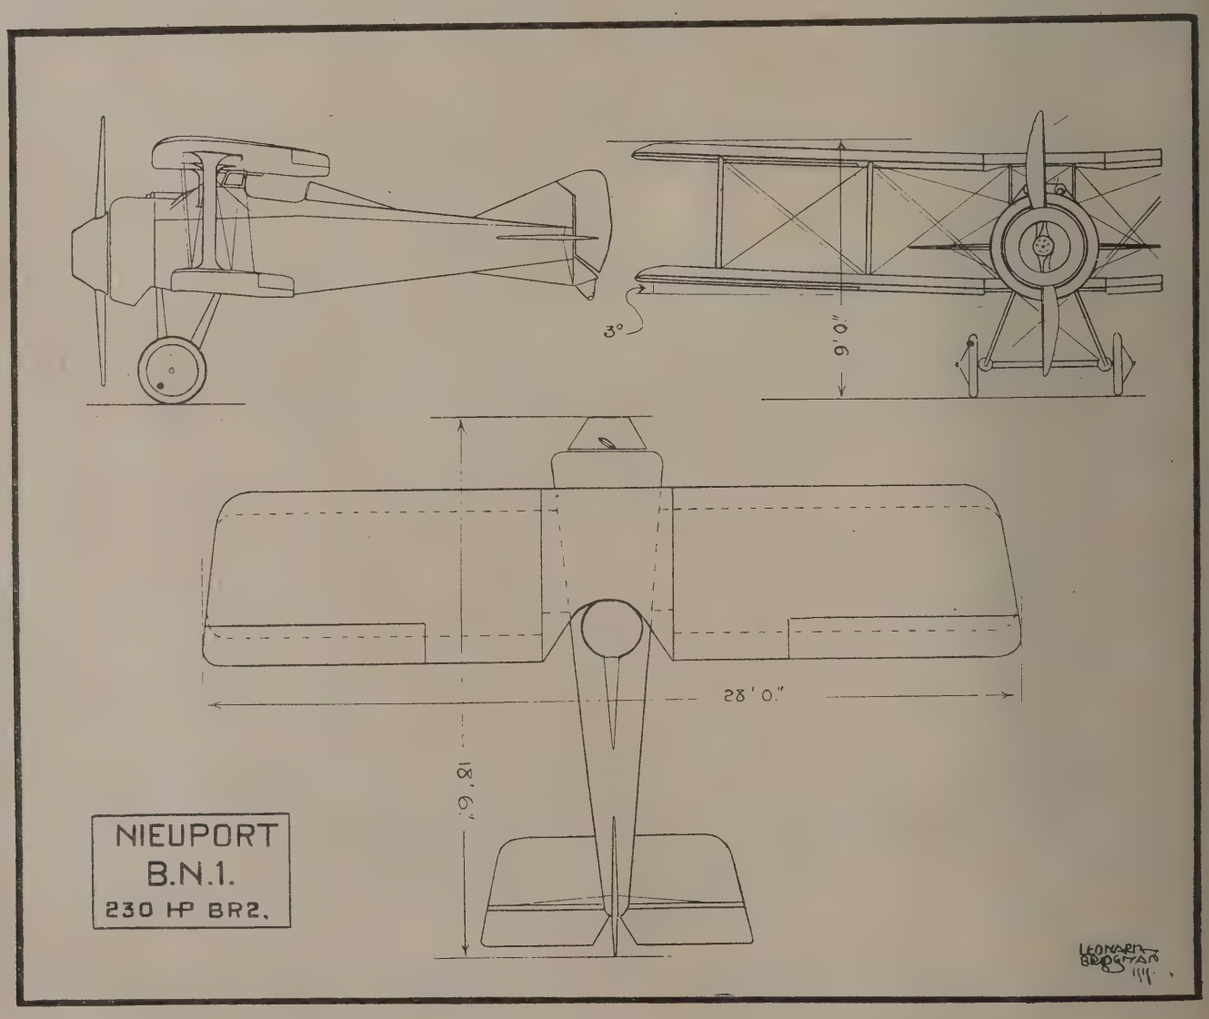
Engine type and h.p.	230-h.p. A.B.C. "Dragonfly"
Airscrew, diameter and pitch and revs.	9 ft. 6 in.
Weight of machine empty	2180 lb.
Load per sq. ft.	8.05 lb.
Weight per h.p.	6.8 lb.
Tank capacity in hours	3 hours at 20,000 ft.
Tank capacity in gallons	40 gals.
Performance—	
Speed at 10,000 ft.	138 m.p.h.
Climb—	
To 20,000 ft.	20 min.
Disposable load apart from fuel	360 lb.

THE BRITISH NIEUPORT B.N.1.

The B.N.1 was a fast single-seater scout designed in March, 1918. In general constructional details it follows very closely the "Nighthawk," the fuselage and tail unit being almost identical, with the exception that it is adapted to take the 230-h.p. B.R.2 engine, which necessitates a different engine bearer plate and also a different cowling. A large conical spinner is fitted to the airscrew boss. The planes are of equal span, but the upper has a greater chord than the bottom plane. Two single streamline struts, which are splayed out at the top and bottom to fittings on the front and rear spars of both planes, are carried on each side of the fuselage and are braced in the usual manner from the spar fittings. The undercarriage is the "Nighthawk" type already described. The armament consists of two fixed Vickers guns firing through the propeller, and one pivoted Lewis gun on the top plane within easy reach of the pilot.

SPECIFICATION.

Type of machine	British Nieuport single-seater tractor biplane
Name of machine	B.N.1
Purpose for which intended	Single-seater fighting scout
Span	28 ft.
Gap	4 ft. 3 in.
Length	18 ft. 6 in.
Height	9 ft.
Chord	6 ft. (top) 4 ft. 2 in. (bottom)
Total surface of wings	260 sq. ft.
Total area of tail	28 sq. ft.
Area of elevators	10 sq. ft.
Area of rudder	5 sq. ft.
Area of fins	5.2 sq. ft.
Area of each aileron and total area	10 sq. ft. (top) 5 sq. ft. (bottom)—30 sq. ft. total
Engine type and h.p.	230-h.p. B.R.2
Airscrew diameter	9 ft. 3 in.
Weight of machine	2030 lb.
Load per sq. ft.	7.8 lb.
Tank capacity in hours	3 hr. at 15,000 ft.
Tank capacity in gallons	36 gals.
Performance—	
Speed at 15,000 ft.	127 m.p.h.
Climb—	
To 15,000 ft.	16 min.
Maximum height	26,000 ft.
Useful load	410 lb.



THE NIEUPORT "LONDON."

The Nieuport "London" was designed this year as a quick production night-bomber, and, as such, has the minimum number of metal fittings, and parts are made as simply as possible. The machine is also to be produced as a passenger-carrying or commercial machine, and in lieu of the war load consisting of a crew of four, one Lewis gun and nine 250-lb. bombs, accommodation will be allowed for one pilot and 13 passengers, or a useful load of 2,685 lb. of mails or goods.

The specification given is that of the commercial edition.

SPECIFICATION.

Type of machine	Twin-engined tractor triplane
Name or type No. of machine	Nieuport 12-seater triplane
Purpose for which intended	Commercial, etc.
Span	60 ft. 8 in.
Gap	5 ft. 10 in.
Overall length	39 ft. 6 in.
Maximum height	17 ft. 6 in.
Chord	6 ft. 8 in.
Total surface of wings	1,100 sq. ft.

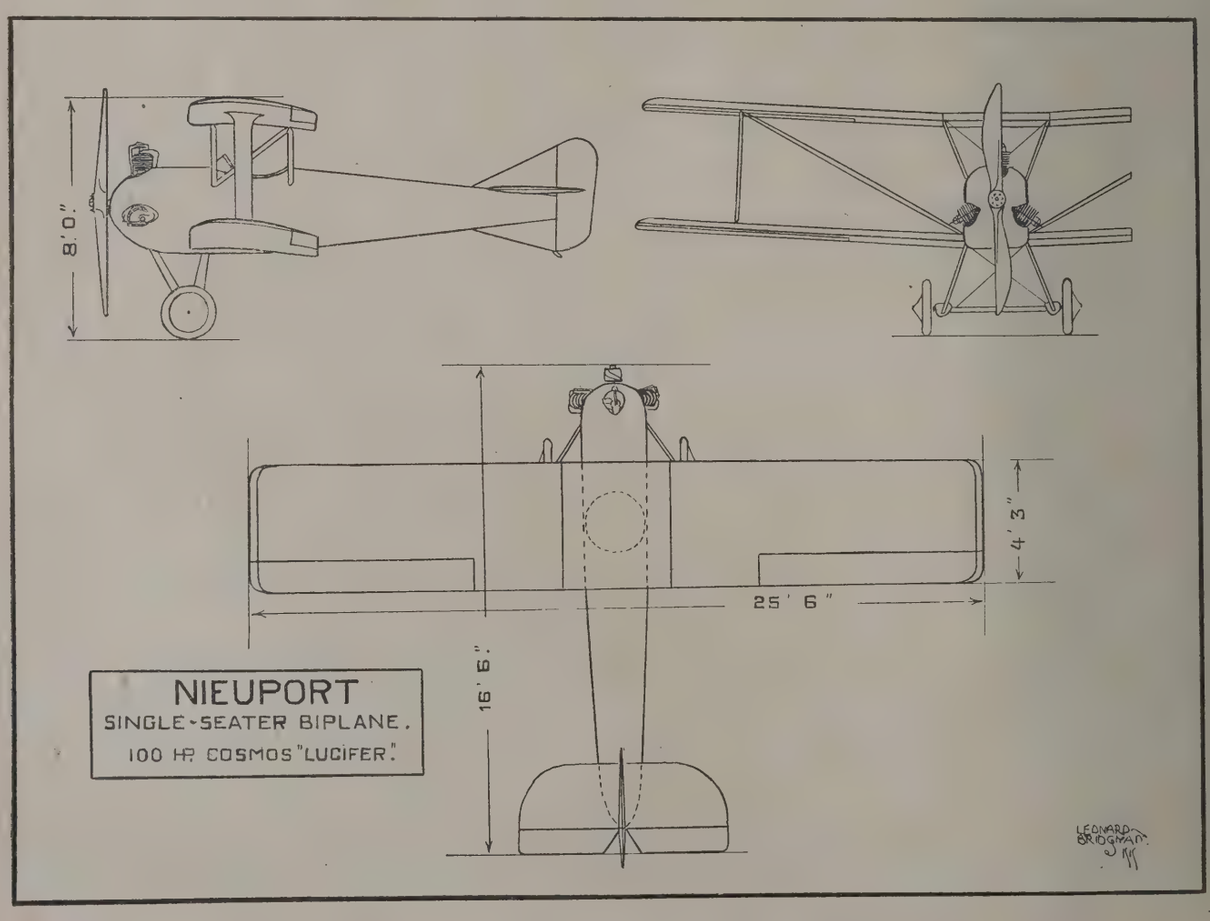
Area of elevators	40 sq. ft.
Area of rudder	20 sq. ft.
Area of fin	30 sq. ft.
Area of each aileron and total area	20 sq. ft.—120 sq. ft.
Engine type and h.p.	Two 320-h.p. A.B.C. "Dragonfly"
Weight of machine empty	8530 lb.
Load per sq. ft.	7·75 lb.
Weight per h.p.	13·55 lb.
Tank capacity in hours	4 hr. at 10,000 ft.
Tank capacity in gallons	175 gals.
Performance—	
Speed low down	100 m.p.h.
Climb—	
To 10,000 ft.	30 min.
Disposable load apart from fuel	2,685 lb.

In addition to these machines, and purely as a post-war development, the firm have designed and are to construct the machines hereafter described.

THE BRITISH NIEUPORT SINGLE-SEATER BIPLANE.

This machine is a small fast single-seater biplane suitable for police and customs work or sporting purposes.

It has been designed with a view to simplicity in erection and maintenance and to this end the whole machine has been built to jig as a non-adjustable but rigid structure so that the machine merely fits together like a jig-saw puzzle, the parts being held in place by pins. There is no external wire bracing, the principal loads being taken whilst in flight by two inclined struts running from the wings' roots where they join the fuselage to the top of the interplane struts. A two-seater side-by-side edition of the machines is also being brought out which has the same characteristics and mode of assembly. Both machines are fitted with the new 100-h.p. Cosmos "Lucifer" engine.



SPECIFICATION.

Type	Single-seater tractor biplane
Purpose for which intended	Sporting, etc.
Span	25 ft. 6 in.
Gap	4 ft.
Length	16 ft. 6 in.
Height	8 ft.
Chord	4 ft. 3 in.
Total surface of wings	200 sq. ft.
Total area of tail	24 sq. ft.
Area of elevators	9 sq. ft.
Area of rudder	4 sq. ft.
Area of fins	3.6 sq. ft.
Area of each aileron and total area	5 sq. ft.—20 sq. ft.
Engine type and h.p.	100-h.p. Cosmos "Lucifer"
Weight per sq. ft.	5.25 lb.
Weight per h.p.	10.5 lb.
Tank capacity in gallons	20 gals.
Tank capacity in hours	3 hr.
Performance—	
Speed	100 m.p.h.
Climb—	
To 10,000 ft.	13 min.
Ceiling	20,000 ft.
Useful load	205 lb.

THE NIEUPORT TWO SEATER.

SPECIFICATION.

Type of machine	Two-seater tractor biplane
Purpose for which intended	Sporting, commercial, etc.
Span	26 ft.
Gap	4 ft. 3 in.
Length	18 ft.
Height	7 ft. 9 in.
Chord	4 ft. 6 in.
Total surface of wings	220 sq. ft.
Total area of tail	21 sq. ft.
Area of elevators	10 sq. ft.
Area of rudder	6 sq. ft.
Area of fin	42 sq. ft.
Area of each aileron and total area	5 sq. ft.—20 sq. ft.
Engine type and h.p.	100-h.p. Cosmos "Lucifer"
Weight of machine	1,230 lb.
Load per sq. ft.	5.6 lb.
Load per h.p.	12.3 lb.
Tank capacity in hours	3 hr.
Tank capacity in gallons	20 gals.
Performance—	
Speed	90 m.p.h.
Climb—	
To 10,000 ft.	20 min.
Maximum height	18,000 ft.
Useful load	383 lb.

AMERICAN ENGINE TESTS UNDER HIGH ALTITUDE CONDITIONS

(*Continued.*)

GENERAL NATURE OF RESEARCH UNDERTAKEN.

The problem first presented by the National Advisory Committee for solution by the use of the Altitude Laboratory was that of the performance of different grades of gasoline at high altitudes in typical aircraft engines. The Lubrication Division of the Signal Corps requested also the preservation of samples of the lubricating oil to determine the effect of fuel composition and of altitude, on the deterioration of such oils. A staff of two or three men were detailed by the Lubrication Division to assist in securing the desired data.

As different grades of fuel affect engine-power and performances only to a very slight extent, the satisfactory solution of this problem required the highest possible accuracy in obtaining complete data on engine performance, as previously outlined. Thus, a practice was established by which all the measurements of power, speed, fuel consumption, barometric pressure, air and water flow, temperature, and pressure, provided for by the apparatus, are customarily made, no matter what is the immediate purpose of the test in hand. The result is, in addition to the data directly desired, an accumulation of valuable supplementary data on engine performance, much of which has not yet been analysed

Observations have been made to determine specifically the following relations :—

1. Horse-power-altitude relation for engines at normal speed.

2. Horse-power-speed relation at a range of altitudes up to 20,000 feet.

3. Horse-power-compression ratio for normal speed, using compression ratios of 4.7, 5.3, and 6.2 to 1 at a range of altitudes up to 30,000 feet.

4. Horse-power-inlet air temperature at a range of speeds and altitudes.

5. Effect of variation of intake pressure on horse-power at a range of altitudes, to simulate the effect of supercharging equipment.

6. Effect of exhaust back pressure on horse-power, over a limited range of pressures.

7. Mechanical losses at various speeds, altitudes, and engine temperatures.

8. Metering characteristics of a number of different types of carburetters, with and without altitude compensation or control, for the full range of speeds and altitudes.

9. Optimum mixture ratios for maximum power over the range of speeds and altitudes, with several different carburetters.

10. The performance of a number of automatic and hand-operated altitude compensation devices for different carburetters.

11. The total heat distribution for all speeds and air densities at full throttle.

12. The performance of special fuels; "Hector," a combination of cyclo-hexane and benzol; 'Alco-gas," a combination of alcohol, benzol, gasoline, and other, at a compression ratio of 7.2 to 1.

Other relations have been investigated from time to time. Moreover, the detailed records taken for each test include much information bearing on other characteristics of engine performance, such as, for instance, the behaviour of spark plugs and ignition systems under conditions of low air pressure and temperature.

THE NEW DYNAMOMETER AND ALTITUDE LABORATORY.

As has been previously stated, the Altitude Laboratory will soon be housed in a permanent building, which is being erected near the present temporary structure. The new building has a rectangular floor plan measuring 50 ft. by 150 ft., and is constructed of brick and concrete in a thoroughly substantial manner.

This building will contain two altitude chambers upon similar lines to the one described. In testing a single large engine at high altitudes the doors between the two chambers may be left open, which permits the use of the two vacuum pumps and banks of cooling coils, thus greatly increasing the capacity of the plant.

In connection with one of the chambers two 300 horse-power electric dynamometers, and with the other one 400 horse-power dynamometer will be used. The foundations of the dynamometers are provided with extension bed-plates at the ends opposite the chambers, on which to mount engines for test purposes when it is not necessary to conduct the test at other than ground conditions.

A space is provided in the centre of the floor plan for the installation of either a drum or tractor type dynamometer, on which to test motor vehicles and transmission assemblies. The power delivered to the drums or caterpillars may be transmitted by chains to two electric dynamometers. Like the ones for the Altitude Laboratory, they are arranged with extension bed-plates, so that they may be used to test separate engines when required.

A third dynamometer with a capacity of 50 horse-power is arranged for coupling to any type of small engine or to the drive-shaft of a rear axle assembly for test purposes.

The exhaust gases from the different engines, except those in the altitude chambers, will pass to an underground duct, from which they will be withdrawn by an exhaust fan discharging through a pipe in the roof.

For about one-third of its length at the east end the buliding is divided into a basement, main and mezzanine floors. In the basement is placed the refrigerating plant for the Altitude Laboratory, with space left for other machinery. The north side of this portion of the main floor is occupied by the machine shop, designed to care for all the ordinary repairs to the plant and engines. On the south side are located the office, toilet and wash-room, and the tool and store-room. The mezzanine floor is divided into two laboratory rooms, which may be used for any of the lighter testing apparatus.

The plant will be equipped with travelling chain hoists for the convenient handling of engines and other apparatus, and with the necessary work benches, etc.

It is planned to have the laboratory in running order this summer.

THE VARIATION OF POWER WITH HEIGHT.

Of the experiments carried out in the Altitude Laboratory before described, the subject of the first report yet published—No. 7—is the variation of engine horse-power with altitude, and with varying compression ratios.

The series of tests upon which this report is based were made upon an 8-cylinder 150 h.p. Hispano-Suiza engine built by the Wright-Martin Aircraft Corporation. For the purposes of these tests this engine was furnished with three sets of pistons, giving compression ratios of 4.7 (low), 5.3 (high), and 6.2 (extra high) respectively.

The engine was run throughout on a single grade of fuel (Grade X), and with a Claudel carburetter adjusted by hand to give maximum power under each set of conditions.

All tests were made at an approximately uniform speed, and all results were corrected to a standard speed of 1,500 r.p.m.

In the earlier tests the horse-powers were corrected to O°C., while in the later ones they were corrected to standard temperatures for given barometric pressures, that is to say, to the standard temperature, which, in conjunction with the barometric pressure, correspands to a given altitude in the standard—or average—atmosphere.

Thus, these later tests were carried out under conditions simulating those of certain definite "standard" altitudes.

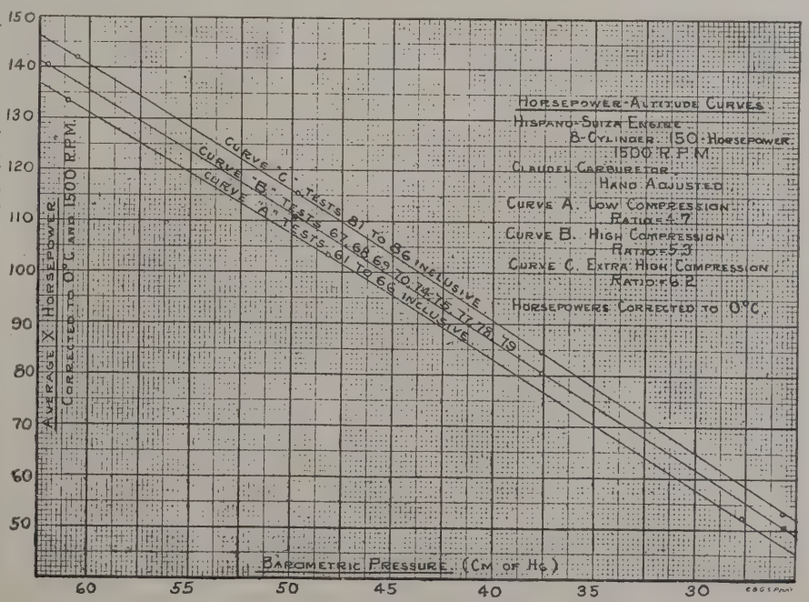


Fig. 1.

Actually four such "standard" altitudes were simulated in these later tests—as shown in the following table:—

Barometric pressure in centimetres of Mercury.	Temperatures in Degrees Cent.	Approx mate altitud in feet?
62.1	10.1	5,500
49.8	-- 0.1	11,500
37.6	—15.1	19,200
25.6	—36.6	29,600

The figures for altitude are computed from the formula

$$H = 62,900 \log 10 \frac{76}{P}.$$

obtained from the Smithsonian Meteorological Tables for 1907, page, 100, in which H is the altitude in feet, and P is the atmospheric pressure in centimetres of mercury.

This formula is slightly different from certain expressions in use in this country, but the differences are relatively unimportant.

The general result of these tests is exhibited in the curves shown herewith.

Fig. 1 gives the effective h.p. of the particular engine with low, high and extra high compression ratios corrected to a temperature of O.°C. plotted against barometric pressure in cms. of mercury.

Fig. 2 shows (Curve B) the experimentally determined temperature correction to be applied in order to reduce the developed h.p. at any actually observed temperature to the h.p. which would be developed at O.°C. Upon the grounds of elementary theory the h.p. developed by an internal combustion engine under varying atmospheric conditions should be directly proportional to the air density, which is in its turn (a) directly proportional to the barometric pressure, and (b) in inverse proportion to the absolute temperature.

The temperature correction factor (Fo in the figure) should thus be $Fo = \frac{273+t}{273}$ where t is the observed temperature (Cent.).

This theoretical factor is plotted on Fig. 2 (Curve A) and will be seen to diverge considerably from the experimental results.

These show that Fo in practice follows the equation

$$Fo = \frac{529+t}{529}$$

and that the developed h.p. rises at a slower rate with increase in temperature than does the air density.

Fig. 3 gives the ratio of the horse-power of the engine fitted with A, low compression, B, high compression, and C, extra high compression pistons, at various standard altitudes to the horse-power developed at standard sea level and at 1,500 r.p.m. with the high compression (ratio 5.3 to 1) pistons.

The curves of Fig. 4 illustrate the variation in horse-power with compression ratio at different altitudes.

The horse-power developed with the 5.3 or "high" compression ratio, at the different altitudes, was taken as 100 per cent., and the other two compression ratios were plotted as percentages of this curve. As will be seen upon examination, the gain in horse-power due to "extra-high" over "high" compression amounts to

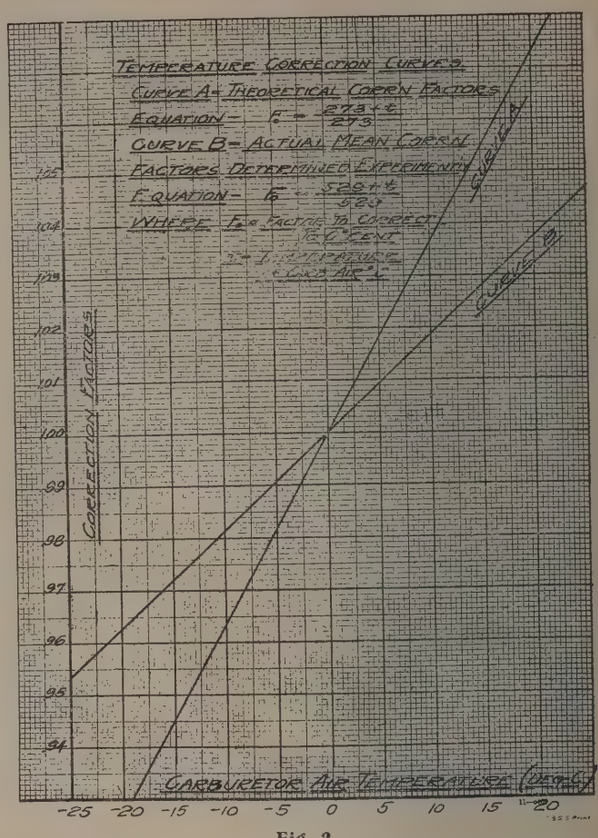

Fig. 2.

but 2.8 per cent. at 5,000 feet, while it increases to nearly 5.8 per cent. at 30,000 feet. Likewise, the decrease in horse-power due to "low" compression, while only 3.3 per cent. at 5,000 feet, amounts to about 7.3 per cent. at 30,000 feet.

It is evident, therefore, that the value of high compression is more apparent at high than at low altitudes.

It should be pointed out that any comparison of absolute horse-power for the different compression ratios may be misleading as the engine conditions, such as fit of piston and rings, condition of valves, etc., were not the same in each case. However, the manner in which the horse-power varies with barometric pressure in each case may be taken as characteristic for the given combination of engine, carburetter, and fuel with a given compression ratio.

The rate at which the engine h.p. of an aeroplane decreases with height is an important factor in the estimate of the limiting height which an aeroplane can reach and in predicting the rate of climb possible at high altitudes. It has been usual to assume that the h.p. variation was directly as the air density, i.e., directly as:—

$$\frac{P_H \times 273+to}{P_o \quad 273+tH}$$

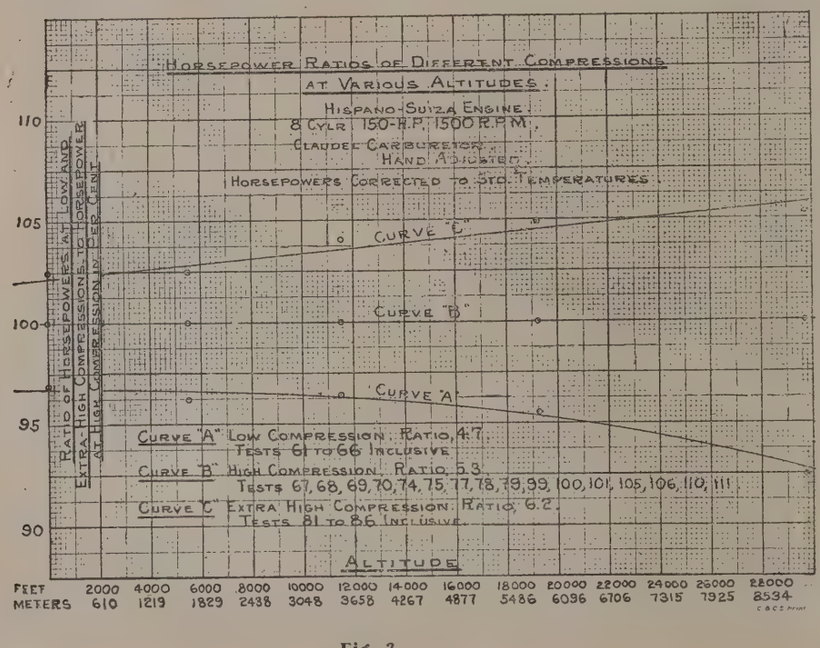
where

P_H = Barometric pressure at height H
P_o = Barometric pressure at sea level
t_H = Temperature (Cent.) at height H
to = Temperature (Cent.) at sea level.

and to then introduce some factor, based on experience or guesswork to allow for the known inaccuracies—such as the fact that some portion of the mechanical losses in the engine were independent of the air density, and that with very low temperature of fuel and air there were considerable heat losses in warming these up to combustion temperatures.

The result of these tests is to give a definite expression for the variation in h.p. with alteration in barometer and temperature of one particular type of engine—which is probably fairly accurate for the generality of water-cooled engines.

This expression would be:—



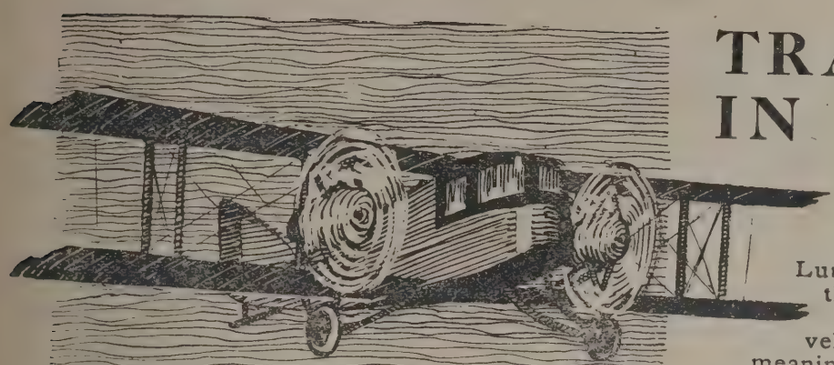


Fig. 3.

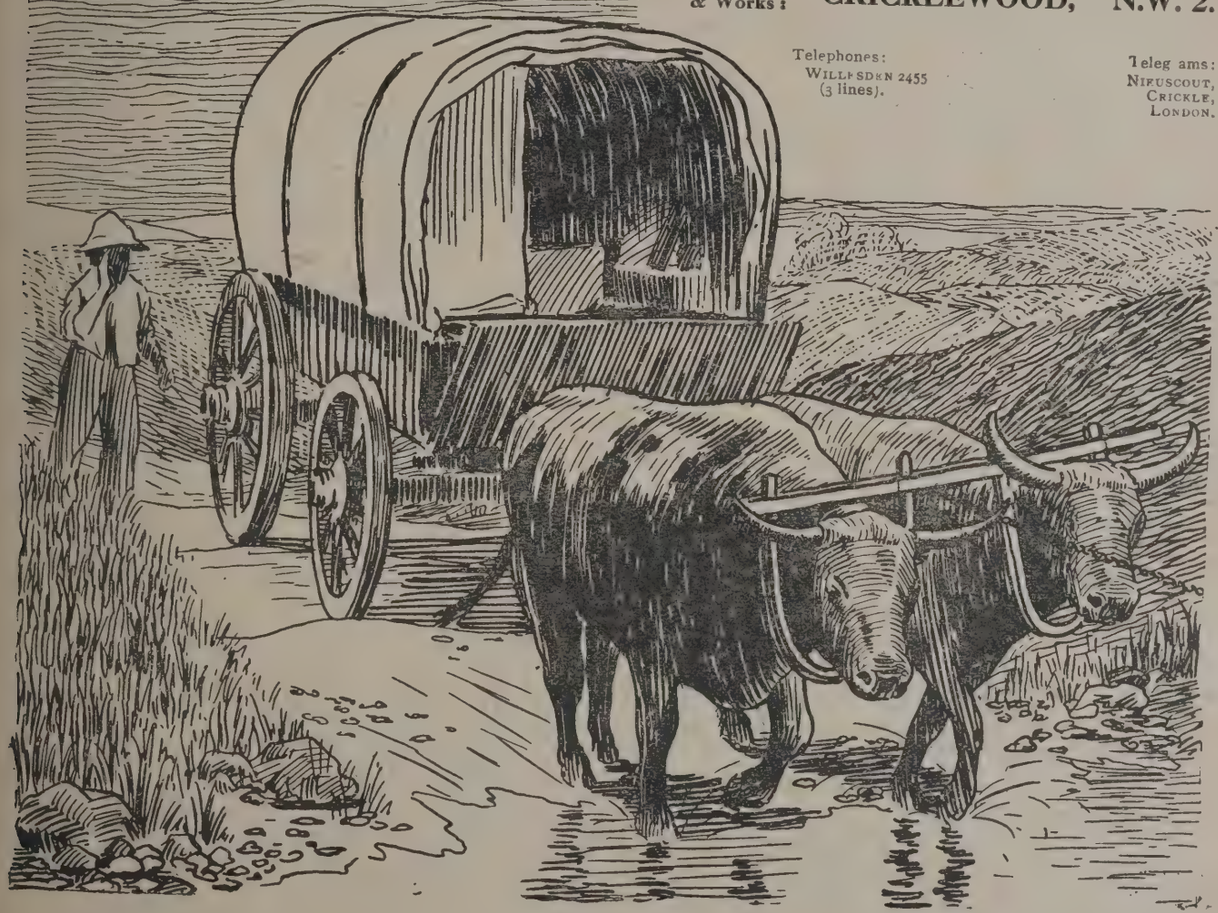
No. 4. **The South African Ox Wagon.**

Lumbering, jolting, squeaking along, the old Buck Wagon treks its cumbersome way across the high veldt—Discomfort to the uttermost meaning of the word. The stifling heat. The rough track. The flies. The unintelligible jargon from the kaffir driver. Oxen straining at the yoke to keep the two-mile-an-hour pace going.

All jarring one's nerves for hours on end. Yet for generations such mode of transport has held its own!



But now at last a rival appears on the scene—a rival that brings comfort and speed—the Aeroplane!

The machine illustrated above is the Nieuport 4-seater passenger and goods plane.

Offices & Works: **CRICKLEWOOD, N.W. 2.**

Telephones: WILLESDEN 2455 (3 lines).

Telegrams: NIEUSCOUT, CRICKLE, LONDON.

H.P. varies as

$$\frac{P_H}{P_o} \times \frac{529+t_o}{529+t_H}$$

It may be assumed that this expression will be considerably modified with engines of radically different types, and that, in particular, the rotary type of air-cooled engine will conform more nearly to the theoretical direct variation with the density than is shown by this equation.

A further series of tests carried out on the same engine and upon a 180-h.p. Hispano-Suiza of the same make with three different carburetters showed some slight variation in the effect of temperature with the carburetter used, but generally agreed very closely with the temperature correction factors given in Report No. 7, which is mentioned above. The results of this later set of tests constitute the subject of a separate Report (No. 8), which, however, leads to nothing further than to a confirmation of the deduction made above.

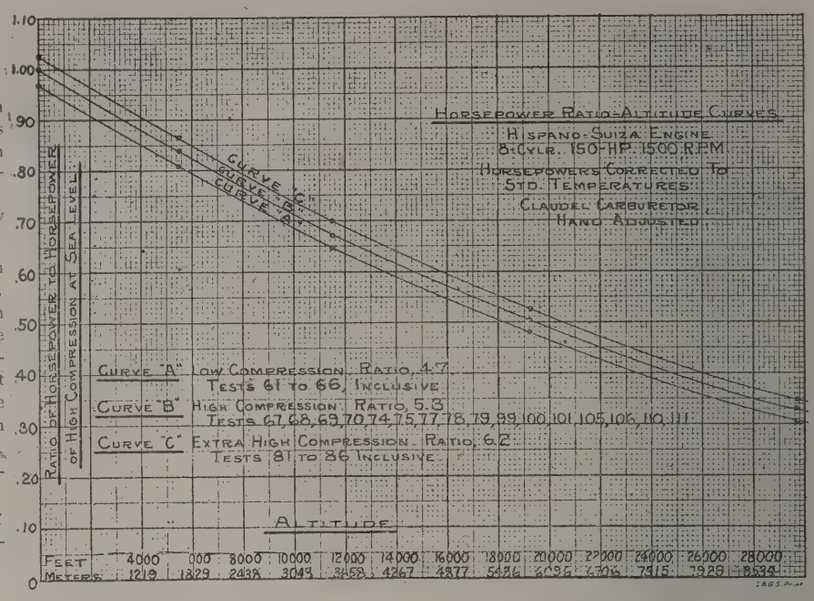


Fig. 4.

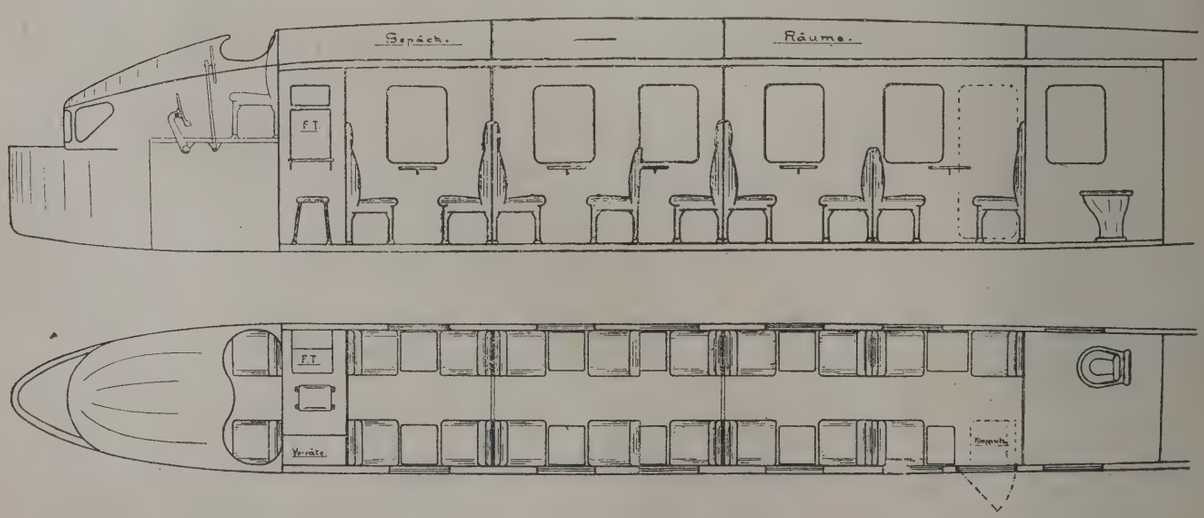
GERMAN COMMERCIAL AFTER-WAR AIRCRAFT.



The end of the war has given Germany a good opportunity for developing civil and commercial aviation, as a start did not have to be made with joy-riding. Owing to the total breakdown of the railways more than other things, aircraft have come to the fore as the speediest, the most certain, if not the safest means of transportation. The cost of aerial travelling cannot be helped for those who, perforce, have to travel, but most people are not travelling at all, owing to the present railway troubles. Should the re-establishment of the railways to something like normal conditions not bring the cost down to the earthbound regions soon, which does not seem possible, as the railroad inefficiency is owing to lack of materials, and as the locomotive output is less than ever, thanks to strikes, then aircraft may have chances of developing into pure commercial types, in spite of the otherwise sad financial situation.

At present G and C class aeroplanes are chiefly used, i.e., the twin-engined A.E.G. five-seaters, made by the German Air Shipping Co., and their modern two-seaters, made by the Sablatnig and Rumpler works. These are the three foremost enterprises, and have Government licence for passengers, mail and parcel aerial service.

So far, services appear to have been successful, which means that delays have not been caused by technical or meteorological factors, but by strikes and the lack of petrol resulting from them. Thus the Deutsche Luftrederei has for some time only been able to maintain the main lines between Berlin and Weimar, and although it has acquired the former naval sheds at Aabenraa in Sleswig, it has been held up by fuel troubles. The Sablatnig Co. hopes to inaugurate a service from Sleswig to Copenhagen, though so far it has not the sanction of the Danish Government.

As they are the persons chiefly forced to travel these days the artists, actors and actresses are the best pioneers and advertisers of the various commercial aviation firms.

The Sablatnig enterprise employs its night-flying N model with good manœuvring capabilities. It is equipped with a 230 h.p. Benz engine, and has the front observer's cockpit transformed into an enclosed narrow cabin for four passengers, which makes the machine appear rather nose-heavy in landing. Various other aircraft works have adopted the Airco two-passenger limousine fashion fuselage for their modern light two-seater (C.L. class) biplanes, by raising the rear observer's cockpit. The

Outline Drawings of German Passenger Machines.

D.F.W. works in Leipzig and the Hannoversche Waggonfabrik have done this.

Most other passenger-flying has been done with the Staaken giant type, which is now a combined tractor and pusher biplane with four engines in two interplane power-eggs. A regular week-end trip service, similar to the Farman-Goliath Paris-Brussels one, is run between Berlin and the seaside resort Swinemünde, and affords the wearied inhabitants of the capital some possibilities of fresh air. Both Staaken aeroplanes and seaplanes are employed with the fuselage nose made into a passenger cabin. One Staaken aircraft has with full passenger load crossed Mount Brocken.

Among the licensed builders of this well-employed type is the Aviatik works, now situated at Leipzig-Heiterblick. They manufacture for commercial, mail and passenger service a R.III model, with four 250 h.p. six-cyl. Benz motors. The main dimensions are: Span, 43½ metres; maximum length, 22½ m.; maximum height, 6½ m.; empty, weight, 9 tons; fuel and crew, 1,800 kg.; useful load, 1,800 kg.; total weight, 12,600 kg. The crew comprise: One captain, two pilots, two engineers, and one steward. The fuel capacity suffices for a 7 hours' flight, or a distance of 875 km. The speed is 125 kilometres per hour at an altitude of 7,500 ft., the climb being 10,500 ft. in 100 min.; 12,000 ft. is the ceiling. A part view of the aircraft showing well the arrangement of the passenger cabin and pilot's position is given.—Anglo-Dane.

THE WIRELESS SOCIETY.

The committee of the Wireless Society of London met recently under the presidency of Mr. Alan A. Campbell-Swinton, F.R.S., with a view to an early resumption of activities. The hon. secretary, Mr. R. H. Klein, having resigned and having been elected an acting vice-president, Mr. Leslie McMichael, of 30, West End Lane, West Hampstead, N.W.6, has been elected hon. secretary, and to him all communications should be addressed. Intending new members and those who were members at the outbreak of war who have changed their addresses are requested to communicate with the hon. secretary.

The Society is open to all those interested in the study and furtherance of wireless telegraphy, amateur or professional.

The Society is at present in communication with the Post Office on the subject of licences.

The finding of new club rooms is engaging the attention of the committee and it is hoped to secure premises where the wireless equipment of the Society can be installed and used.

A general meeting will be held in a few weeks' time, of which due notice will appear in the Press and will be sent to members and those who intend becoming members.

The Society's activities should make an appeal to the considerable number of readers of The Aeroplane who are interested in the application of wireless telegraphy and telephony to aeronautical needs.

¶ "GRIPOLY" Solid Woven Belting is made from Camel Hair Yarns, with a small percentage of cotton, and woven by a patent process which insures the greatest possible strength and evenly consistent wear.

¶ "GRIPOLY" has a triple twisted edge, interwoven with the belting which effectively resists fraying caused by guide forks.

¶ "GRIPOLY" Solid Woven Belting is flexible, non-slipping, stretchless, impervious to heat and moisture and variations of temperature. It is the best all-round belting.

Let us know your requirements and we will advise you as to the best type of "GRIPOLY" for your needs.

Aeroplane Construction

In aeroplane construction the vital factor is "how many machines can be turned out in a given time." This depends entirely upon the efficiency of the machinery employed. And no machine reaches its highest point of production until its clutches, brakes, etc., are fitted with Ferodo Fabric.

Ferodo Fabrics are the most efficient transmitters of energy. Leather, wood, textile beltings, etc., are out of date for Friction drives and Braking purposes. The moment they become soaked with oil they are useless; Ferodo Fabrics never slip, never seize; are not affected by water, oil or acid, and are absolutely reliable under all conditions.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

ARE AIRCRAFT ESSENTIAL?

By "MEDWAY."

A writer in the "Times," dealing at some length with the Government's policy in respect of commercial aviation, puts forward a half-hearted apology for our national neglect to put our backs into the job of getting the cream of the world's business in this new line. He remarks, "Strictly speaking, aircraft cannot be regarded as a necessity except in war. At present they are a luxury—at least in the sense that, if the choice in the last resort was between coal and an aeroplane, no wise man would choose the aeroplane."

Admittedly, the originator of this great thought does not seem to set much store by it himself, because the main trend of his argument is sufficiently reasonable and progressive. At the same time, it is to be supposed that, if he had regarded the remark quoted as being hopelessly inane, he would have refrained from making it. By working along his line of reasoning, one can reduce essentials to an absurd minimum. If the choice in the last resort was between coal and air, no wise man would choose the coal, partly because he would have to postpone any hopes of warmth until his arrival in the next world, and partly because the coal would not burn if the air were not existent. Similarly, of course, if we had no coal, we could not make any aeroplanes, or, for that matter, any other engineering products. The aeroplane, in fact, is part of the result of our having coal, but is not the whole result. Euclid has quite correctly informed us that the part is less than the whole.

We cannot very well complain of the contention that coal is more essential than aeroplanes, but one can fairly complain of the deduction therefrom that aeroplanes are not truly essential.

Regarded as a Luxury.

Our friend says that aeroplanes are at present a luxury. I suppose that just the same thing was thought in other days about the railway locomotive or the steamship. One might, perhaps, argue that no modern methods of transport are essential. We must admit that there was a time when people got on without them. Nothing that we manufacture can conceivably be altogether essential in its very early stages. It only becomes completely essential when it has so far established itself that competitive methods have been knocked out and there would be nothing to take its place if it were removed. The fact is that almost nothing is absolutely essential to the human race, with the exception of air, food, water, and heat.

This does not mean that everything else can be properly called a luxury. What is or is not a luxury depends mainly upon environment. What would be a luxury to a savage might be a commonplace necessity to a civilised man.

Perhaps we may define a luxury as something which we could do without and yet suffer no inconvenience whatever. The question is how long we must do without it in order to establish the case. I venture to suggest that, if we in this country did without aeroplanes for the next ten years, we should have dropped hopelessly out of our position as a great nation, not only on the score of our military feebleness, but because we should be entirely beaten in commerce, just as we should have been already had we refused to adopt railways, steamships, telephones, and so on.

A Game of Hide-and-Seek.

It is the business of the Government to look not 10 minutes but 10 years ahead. It is not the business of the Government to take unnecessary risks, such that, if things go wrong, the results are fatal, but rather to ensure in advance against anything of the kind by careful but adequate expenditure of public funds. We are told time and again that the Department of Civil Aviation lacks an adequate staff. This may be a good enough excuse for deficiencies on the part of the Department, but, after all, it merely shuffles the responsibility from one place to another. The average Government official spends his life playing a sort of hide-and-seek with the public. The public discovers that things are going wrong and complains. The official cannot deny that they are going wrong, but points out that the blame must rest on some other Department or Departments unidentified. Generally the poor old Treasury is the scapegoat, but I have an idea that when other Departments ask the Treasury for money they very often put their

The De Havilland 4R Biplane (450 h.p. Napier "Lion") which won the Aerial Derby. The machine is here seen leaving Hendon.

requests in such a form that a refusal goes without saying, and that this is done intentionally and is all part of the game.

Getting back to the question of luxuries, it seems to me that luxury consists very often in doing without modern improvements. To my mind, life in an office before the days of telephones, telegrams, or railway trains, must have been mainly a life of luxury and ease. There was seldom any immediate reason for doing anything at any particular moment. As long as it was done within a week or two it was all right. One's train of thought was not constantly upset by incoming telephone calls or one's temper by futile endeavours to ring up other people. Every step in the speeding-up progress makes life more worrying and the nerve-strain of business more acute.

The Curse of Luxury.

At the present moment we have hardly sacrificed any of the luxury that consists of doing without commercial aeronautics. When the new form of transport has developed it will only constitute another reason why we are obliged to think and act quickly and to be always on the spot.

I think that many people have at one time or another shared with the writer the feeling of relief that comes over one when a business letter is despatched, say, to Australia, and we realise that three months will elapse before the next move has to be made. The quicker our postal facilities, the more rapidly must we be ready to make our moves. Business is rather like a game of chess. You must look ahead, consider what the other fellow will reply and what you will reply afterwards. Given time, it should be possible to play the game without making many bad mistakes, but even the biggest experts would be in trouble if required to play chess with a five-second limit for each move, especially if, like the business man, they had about thirty different games going on at the same time.

So far as I am concerned, I should be only too glad to dispense with all modern accelerating systems, provided my competitors were compelled to do the same. To me they are not luxuries, but painful necessities, and this is the category into which I put commercial aeronautics from the business man's standpoint. The trouble is that, by doing without a thing ourselves, we cannot compel our competitors to follow suit. They will inevitably take the opportunity of getting in ahead of us. This is what will happen if we delude ourselves with the idea that aircraft are a luxury, and that, therefore, there is some kind of excuse to be put up if we make the fatal mistake of neglecting any means by which we can make ourselves the premier nation in aircraft production and in commercial aeronautics.

AIR SUPREMACY.

During the ages England has maintained her greatness and security by her sea supremacy. Without this sea supremacy in the present war victory would never have been possible for us and our Allies; the least that could have happened would have been that all the Powers of the Entente would have starved both for rations and munitions of war. In all probability this country would have been successfully invaded by the enemy, and our armies isolated in France.

The Hun realised that although he could not land troops on our shores in large numbers, because of our sea supremacy, he could cause great demoralisation throughout the country by air raids, more particularly in large towns where munitions of war were being produced.

The Hun, therefore, made frantic efforts to gain and maintain air supremacy; but he failed. And we beat him both at home and overseas in the air, just as we beat him on the sea; in fact, we gained supremacy of the air. We became again, that is to say, an island people, inaccessible to the enemy, and we were enabled by sea and air supremacy to concentrate all our energy at home on backing the armies in the field.

If we had failed to gain this air supremacy, the ever-increasing intensity of enemy air raids must eventually have so paralysed our home industries as to have rendered it impossible for us to win or even continue the war. It was the failure of the U-boats and the super-Gothas which marked the turning point in the war and we began to win; we were not, in other words, to be starved by piracy or demoralised by wholesale air raids into surrender.

The air supremacy which we have gained and maintained during this war we must keep; whatever platitudes people may talk concerning disarmament are very nice in theory, but it must not be forgotten that although might is not necessarily right, the strong man is more able to maintain order than the weak.

We need not denude ourselves of our strength in order to be just and peaceful. However just the weak man's cause, he cannot avoid war being thrust upon him, but with a combination of justice and strength any nation is in a position to prevent war.

If on August 4th, 1914, the Hun had known that this country would enter the war and succeed in raising the fine armies which have been raised, there would have been no war; the Hun took advantage of what he erroneously supposed to be our national weakness.

The geographical position of this country makes us safe from invasion so long as we maintain our sea and air supremacy; as soon as we give up either or both of these factors of national safety we increase the possibility of war in the world by laying ourselves open to invasion by either or both of these means.

We owe it, therefore, to future generations to maintain this supremacy, both for the preservation of this country and its independence, and for prevention of wars in the world.

Navies, armies, and air fleets must be made weapons of the law, and not a means of war. Piracy disappeared from the seas with the appearance of strong, well-trained and organised sea fleets. Criminal slaughter from the air will be made impossible for all time by the maintenance of strong, well-trained air fleets.

Disarmament will not bring about the end of war any more than the abolition of the police force would bring about the end of crime in society. There is always a criminal bully somewhere, seeking for a disarmed fool to rob. Let the fool arm himself and he will be able to prevent the bully from breaking the peace.

The Air Force should be maintained in peace time for mail-carrying and commercial purposes; it should be so organised that, if war be thrust upon us, it can be immediately converted into a means of giving us such air supremacy as will cut that war down to the shortest possible duration.

Nothing is gained by cutting down without reason the expense of maintaining the Navy, Army, and Air Force, which are for the explicit purpose of securing us against wars, and not waging unprovoked wars. War is the most expensive of all things both in life and property.

We will totally disarm when all the world has done so. Our geographical position in the world compels us to be the last nation to disarm.

Aerial navigation has annihilated time and space. In the next war we shall be as vulnerable from China as we have been in this war from Germany—if unarmed.

When the remotest races in the world have joined the League of Nations, and shown their good faith by disarmament, then is the time for us to disarm, and not before.—V. S.

AERONAUTICAL INTELLIGENCE.

The first (statutory) ordinary general meeting of the Aeronautical Intelligence Bureau was held at the registered offices, 30, Bedford Row, London, W.C.1, on Aug. 11th.

The aims and objects of the Bureau (although this was only incorporated on June 13th, 1919), are obviously becoming known far afield, which is shown by the applications for admission to membership received from Continental firms. Negotiations are being made for linking up with a sister organisation in the U.S.A. which, if brought to a satisfactory conclusion, will amplify the Bureau's commercial records of the firms interested in aeronautics in the States.

The accession of Mr. A. P. Newall, of the Woodside Engineering Co., Ltd., to the Council of Management makes that body completely representative of six of the principal sections of the trade. The experimental stage having been passed and the value of the organisation being amply proved, Mr. P. P. Nicholl has entered into a prolonged agreement to continue his work as secretary and manager.

A REMOVAL.

The Blackburn Aeroplane and Motor Co., Ltd., of Olympia, Leeds, are removing their aeroplane factory to Brough, near Hull, where there is an aerodrome. It is also intended to enlarge their works at Brough. The old works at Olympia will be used for the manufacture of motor-cars, etc.

"Machines must be capable of being started from the Cockpit or Cabin without undue muscular exertion on the part of the pilot."

CIVIL AERIAL TRANSPORT NOTES.

GREAT BRITAIN.

London-Paris Air Services.

The air service to Paris maintained by Aircraft Transport and Travel, Ltd., during the week ending Aug. 30th ran from Le Bourget to Hounslow every day, and from Hounslow to Le Bourget every day except Thursday.

In the middle of the week the weather rendered flying nearly impossible. On Thursday, Aug. 28th, there was a hundred miles an hour hurricane over the Channel according to the official weather report.

Under these conditions Lieut. H. Shaw (late R.A.F.) flew an Airco D.H.4a from Paris to London and did the journey 25 minutes under the scheduled time. A number of parcels and two passengers were carried. The C.G.C.A. (Major-Gen. Sir F. H. Sykes) has conveyed his congratulations to the company in respect of this flight, which he considers a very meritorious performance.

Parcels containing various goods have been carried on every trip. Towards the end of the week business men awoke to the fact that the service would be maintained despite the weather, and much space has been booked in advance for passengers and goods.

It is hoped that the arrangements between the British and French Post Offices will soon permit the carrying of express letters by air. It is understood that the fee will be 2s. 6d. This will include the Post Office charges for express collection and delivery by motor-cycle and special messenger. By the speeding up of land connections it is expected that a letter posted in London during the morning will reach its recipient in Paris during the early afternoon.

Details of the flights made to and from Paris are given in the following table :—

Date.	Type.	Left Hounslow	Arr. Paris	Left Paris	Arr. Hounslow	Pass	Weather
Aug. 25th	D.H 4a.	9.10 a.m.	11.40 a.m.	12 40 p.m.	2.45 p.m.	1	Wind and haze
	D.H.16.	12.30 p.m.	2 45 p.m.			4	
,, 26th	D.H.4a.	1 5 p.m.	3.20 p.m.			2	40 m.p.h. wind
	D.H 16.			12.30 p.m.	3.39 p m.	4	
,, 27th	D.H.9.	12 43 p.m.	3 10 p.m.			1	Do. and 800ft. clouds
	D H.4a.			12.30 p.m.	3.20 p.m.	2	
,, 28th	D.H 4a.			12.30 p.m.	2.20 p.m.	2	100 m.p.h. wind
,, 29th	D.H.4a.	9.0 a m.	11.15 a.m.			2	Low clouds, rain, gusty
	D.H.16.	12.30 p.m.	3.0 p.m.			4	
	D.H.9.	12.30 p m.	2.45 p.m.			2	
	D.H.9.			12 30 p.m.	3.0 p.m.	2	
,, 30th	D.H.4a.	12.30 p m.	2.55 p.m.			2	20 m.p.h. N.W. wind
	D.H.9.			12.30 p.m.	3.10 p.m.	2	
	D.H 4a.			12.40 p.m.	3.20 p.m.	2	

On August 27th, Lady Muriel Paget flew from Paris in the D.H.4a. She was the first woman passenger to cross the Channel since the inauguration of the service.

On August 29th the D.H.16, which flew to Paris, carried four passengers : Sir Sydney Lee, Bt., Mr. and Mrs. Leonard Aldridge, and Mr. A. H. Davies. Mrs. Aldridge was the first woman passenger to fly from London to Paris since the Governments have allowed flying between the two countries.

Carter Paterson and Co., Ltd., and the American Express Co. are agents for the collection and delivery of express parcels and goods for the London-Paris Air Service, run by Aircraft Transport and Travel, Ltd.

With the service starting from Hounslow at 12.30 p.m., parcels will be accepted at Carter Paterson's City office, 3, Cannon Street, up to 10.30 a.m. They will be accepted at Maddox Street, Regent Street, up to 9.45 a.m.

The American Express Co. will also accept parcels in London at their offices in Queen Street, City, and Haymarket at times corresponding to those above. Parcels will also be accepted by the Paris branch of this firm.

The Handley Page machine, carrying 11 journalists, which left Cricklewood for Paris at 8.30 a.m. on Aug. 25th, reached Hounslow at 9.30 a.m., and arrived at Le Bourget aerodrome at 1.5 p.m.

Owing to Customs delays and the weather conditions, it did not leave Paris until 1 p.m. on the next day, Aug. 26th. It then crossed the Channel, and, on account of the gale blowing, landed at Lympne at 3.30 p.m.

On Aug. 27th it left Lympne at 4.40 p.m., and arrived at Cricklewood at 5.35 p.m.

Handley Page, Ltd., arranged to start their alternate day service to Paris on Tuesday, Sept. 2nd. A machine will leave Cricklewood at 12 noon on Tuesdays, Thursdays, and Saturdays, and will return from Le Bourget on the alternate days.

As no agreement has yet been made between the English and Belgian Governments, the London-Brussels service did not start on Monday, Sept. 1st. Arrangements are being made for it to start on Monday, Sept. 8th. On this service flights to Brussels will be made on Mondays, Wednesdays, and Fridays, with return journeys on the alternate days. All these services will start from the aerodromes at noon.

The "Daily News" Free Flights.

The last of the free flights was given on Saturday, August 30th. Since the scheme was started in the beginning of June at Cricklewood, over 2,500 passengers have been given flights.

These flights have given some idea of what flying is like to many people. Although the "Daily News" has done a great deal to popularise flying, in most cases the type of person who has been given a flight has not had any power to do anything to help on civil aviation.

Avro Northern Stations.

There were 17 machines at work on all stations; 246 flights were made, and 546 passengers carried during the week ending August 30th.

The Great Northern Aerial Syndicate.

The Great Northern Aerial Syndicate of Liverpool has planned three routes for their Transatlantic airships to follow :—

(1) Liverpool to York, Hull, Copenhagen, Stockholm, Petrograd, Tomsk, Pekin, San Francisco, New York, Queenstown, and Dublin.

(2) Liverpool to London, Paris, Cairo, Colombo, Perth and Melbourne or Sydney.

(3) Liverpool to Cardiff, Lisbon, Sierra Leone, Cape Town, and Buenos Ayres.

The cost of travel is estimated to be only 4d. a mile. The passage from Liverpool to New York is expected to take two and a half days, and Australia may be reached in seven days.

The proposal is to land large airships from New York at Liverpool, and transfer the passengers for other places to smaller craft.

Negotiations have been completed for the lease of landing grounds at different parts, one being at Kingston-on-Thames.

Aberystwyth.

An Avro aeroplane carrying two passengers, and piloted by Lieut. David (late R.A.F.), crashed near the landing ground at Aberystwyth on August 28th.

The passengers were not injured, but the pilot was taken to the infirmary suffering from injuries to the head and limbs.

Birmingham.

Vast crowds flocked to the Billesley Aerodrome, King's Heath, on August 19th-24th, and 30th-31st, to witness the passenger flying exhibition held there by Vickers Ltd.

Many passengers have been carried in the three-seater Avros. On Saturday, August 23rd, 600 passengers were taken up, and on the next day this number was doubled.

Blackpool.

Owing to four days of continuous rain, sometimes accompanied by storms of hurricane violence, there was not much flying in the north last week. An extraordinary storm sprung up one night about 12 o'clock, increasing in violence till the wind reached a speed of between 65 and 85 miles an hour.

The Avros pegged down on the sand at Blackpool, Southport, and Rhyl suffered considerable damage, the machines, complete with sandbags and pegging-down gear, being carried away and partially wrecked. In one case the machines was lifted up over a fence and carried 50 yards away. One of the night watchmen at Blackpool saved a machine by hanging on to it from 3 a.m. till assistance came at 6 a.m.

This storm was most interesting from a meteorological point of view. The air station in Anglesey, which sends daily reports to the Avro aerodrome in Lancashire, received, and, of course, sent, no warning of the storm, which was only felt in N.W. Ireland, and then burst in full fury on the Lancashire coast, apparently abating considerably as it travelled inland.

Despite the damage to the machines at Blackpool flying took place as usual when the storm had passed. Many messages of regret were received as to the company's bad luck.

Brighton.

Sixty-one passengers were carried in 33 flights in Avro machines during the week ending Aug. 30th. Two cross-country flights were made—one to Bexhill and the other to Birmingham. The weather only allowed three days' flying during the week.

GOSPORT AIRCRAFT Co.

DESIGNERS AND BUILDERS OF

FLYING BOATS

FOR

OCEANIC AND OTHER ROUTES

An F 5 Type FLYING BOAT as constructed by the Gosport Aircraft Co. is now on exhibition at the Dutch Aero Show, Amsterdam. (By kind permission of the Air Ministry.)

A Gosport Design Dual Control Two-seater FLYING BOAT is also being exhibited.

Both these Flying Boats were flown by the Gosport Aircraft Company's Pilots direct to Amsterdam from their Southampton Works.

ISLE OF WIGHT.

There was only one day's flying during the week, and the Avro stations were closed on Aug. 28th as the season was over. Twelve passengers were carried in seven flights.

LONDON.

CRICKLEWOOD.—One is informed by Handley Page, Ltd., that the week-end London-Bournemouth service has been discontinued. The contract expired on Aug. 18th.

Although a few people were carried on these trips, the service was not advertised enough to make it a success. The journeys were very delightful, but the fare was not warranted by the very small saving of time over the railway.

A Handley Page will leave for Spain in a few days, whence it is going on a special mission.

The following numbers of passengers were carried by Handley Page, Limited, during the stated weeks ending :—Aug. 16th, 127; Aug. 23rd, 123, including the Maharajah and Maharanee of Cooch Behar and their two children; Aug. 30th, 130.

On Sunday, the 17th ult., 650 members of the Indian Army visited the works of Handley Page, Ltd., and 60 native officers were given short flights. Two parachute descents were made to the great delight of the troops.

HOUNSLOW.—On August 28th, General Sir W. S. Brancker, K.C.B., A.F.C., flew from Amsterdam to Hounslow in an Airco D.H.10, piloted by Capt. Gathergood. A very rough crossing was experienced. The journey took 3 hours 35 mins.

Ninety-one passengers were taken up in Avro machines during the week ending Aug. 30th, and two cross-country flights were made—one to Newmarket and return and the other to Swansea and return.

NOTTINGHAM AND DERBY.

Sites at Nottingham and Derby have been licensed, and flying weeks will be arranged at these towns by some of the Blackpool and Southport Avro pilots. A popular flight should be the journey between these two Midland towns and return.

SCARBOROUGH.

The North Sea Aerial Navigation Co., Ltd., of Olympia, Leeds, are going to start services from Scarborough to Middlesbrough, Stockton, and Darlington (single fare £5), to Hull (£5 15s.), and to Harrogate (£7 10s.). All these journeys can be completed within the hour.

Three-seater machines will be used. The Company are prepared to quote prices for any journey. Applications should be sent to the agents, Messrs. Rowntree and Sons, 33, Westborough, Scarborough.

Sixty-five passengers have been carried recently by the Company at Scarborough in nine days, notwithstanding the indifferent weather conditions.

The racecourse is constantly crowded with people who wish to see the flying.

An arrangement has been made with the "Daily News" to give 75 free flights.

SWANSEA.

During the week ending Aug. 30th 60 flights were made and 109 passengers were taken up in Avro machines.

WARRINGTON.

According to the "Warrington Examiner," Mr. H. W. Griffin, the Hon. Sec. of the Infirmary Fund, has arranged with the Golden Eagle Aviation Co., Ltd., that they shall visit Warrington to give exhibition flying, and to take up passengers at a guinea a flight. Half the proceeds are to be given to the Infirmary Fund. Mr. Griffin hopes to fix the flying week for the end of September.

WREXHAM.

At the request of the local authorities the Air Ministry recently sent a representative to Wrexham in connection with the proposed establishment of a landing-ground there. The racecourse is the only suitable site in the locality, and before it can be licensed the surface will have to be improved.

ETTRICK BAY, SCOTLAND.

Aerial Photos, Ltd., of Edinburgh, have had a busy week, their machines being commissioned by the "Bulletin" newspaper for a week at Ettrich Bay. The meeting was arranged by Capt. Bond Andrews. His staff of pilots are Capt. Simpson and Lt. Rendle Woodcock, both late R.A.F.

Provost McMillan opened the proceedings. Successful coupon-holders of the "Bulletin" were taken up by the score, and flying went on daily until Wednesday night, August 27th, when a gale of extreme violence which swept over Scotland and the north of England destroyed the machines.

In spite of being sand-bagged down, these machines were lifted into the air and overturned 20 yards away. This naturally concluded the flying for the remainder of the week.

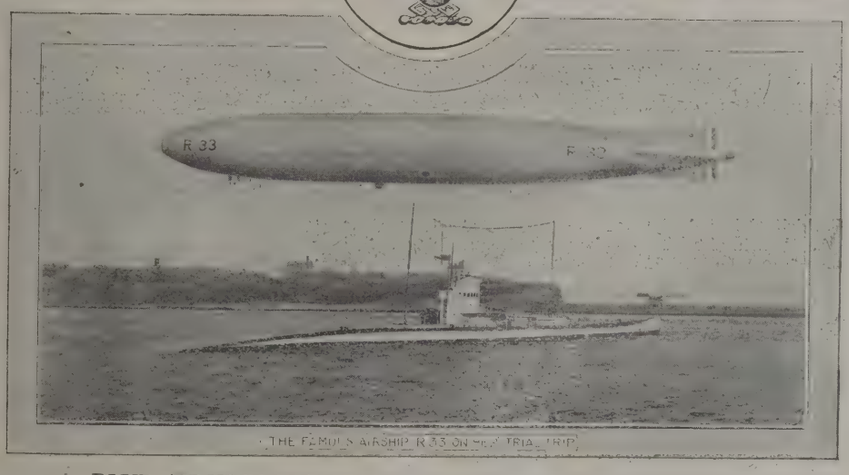
IRELAND.

The Great Northern Aerial Syndicate, Ltd. (Liverpool), have written a letter to the Queenstown Urban District Council stating that they have practically decided to establish a base for their Transatlantic airship service at Queenstown. It is stated that these airships will have accommodation for 150 passengers. Smaller airships to carry 50 persons will be used to take the American passengers to Dublin, Liverpool, Manchester, York, Hull, Norway and Denmark.

CANADA.

The Labrador Forest Surveying Expedition was referred to at some length in the issue of THE AEROPLANE, dated Aug. 20th. The expedition has now returned to Montreal. They discovered vast reserves of pulpwood lands, which previously were believed to be of little value.

HOUNSLOW AERODROME.—A photograph taken from D.H.16, piloted by Major Cyril Paterson, M.C., D.F.C. The first machine to fly from London to Paris on the London-Paris Air Service.



H.R.H. THE PRINCE

of Wales has paid a much appreciated compliment to the new "Victory" Arrol-Johnston Car by purchasing the first model delivered to the public. The car supplied to H.R.H. was standard from all points of view, and differed in no way from the stock type as sold to the ordinary purchaser.

Catalogues from Arrol-Johnston, Ltd., Dumfries, or from London Agents, Messrs. Leverett, Thorp & Kearton, Ltd., 122, New Bond Street, W.1.

TRADE MARK

THE FAMOUS AIRSHIP R 33 ON HER TRIAL TRIP

— RIGID AIRSHIPS FOR WAR, MAIL & PASSENGER SERVICE —

SIR W. G. ARMSTRONG, WHITWORTH & CO., Ltd.,

NEWCASTLE-UPON-TYNE. **Works: Barlow, near Selby, Yorks.**

LONDON OFFICE: 8, GREAT GEORGE ST., WESTMINSTER, S.W.1.

TELEGRAMS: "ZIGZAG PARL, LONDON." TELEPHONE: VICTORIA 4010.

The aeroplanes made many flights and travelled 400 miles inland. Numerous photographs were taken and a series of maps were made. It is expected that the discoveries made by the expedition will lead to the exploitation of large areas of land bearing wood suitable for the manufacture of pulp.

BRAZIL.

Handley Page, Ltd., have secured the first complete aerial concession from the Brazilian Government. They are to carry passengers and mails between Buenos Aires and Pernambuco (2,725 miles), and the intermediate towns. It is hoped to begin the service very soon. At first flying will take place only during the daytime, and the trip will take four days. It is expected that the time of the service will be reduced later to two days by flying by night as well as by day.

DENMARK.

The Danish correspondent of THE AEROPLANE writes :—

On August 24th Major T. Gran, with nine passengers, in a Handley Page, attempted a flight from Copenhagen to Aarhus, 85 miles away, but owing to weather conditions it was found impossible to reach the city, and a landing was made at Aalborg. Christiania was reached from there on August 25th, and a landing was made on the Gardermoen military drilling field.

Nielsen and Winther, Ltd., have closed their aviation department owing to lack of business and great loss. The achievements of their latest production, a 160-h.p. vertical type motor, have not been published. Their last action was to send a 90-h.p. Thulin engined two-seater Nieuport scout to Bolivia, *via* Buenos Aires, for the Danish Lieut. Jarfelt, chief of the Bolivian air service, who will accept the machine if it will climb to the height of the mountains, 18,000 feet.

FRANCE.

M. Clemenceau in June had formed a General Co-Ordination Board. The Decree appointing the Board was signed by President Poincaré and seven Ministers, who were charged to carry out its provisions. General Duval, the Director of Military Aeronautics, was appointed to control the Board.

As a result of the Board the French Government is constructing four rigid airships for commercial purposes, and will run an experimental service with them. The airships and the information obtained will be handed over to a civil transport company when sufficient data and experience have been gained from the service. The Government will make arrangements with the company regarding a subsidy and various charges.

Seaplane and aeroplane services will also be subsidised. Already a contract is being made with a company to start an air service between Toulouse and Rabat (Morocco), with intermediate stations at Barcelona, Alicante and Malaga or Madrid and Seville. A definite number of services each way has to be maintained, and the Government will pay a subsidy for mail space in each machine.

The type of machine and engine to be used is laid down and the prices for passenger and goods traffic are fixed. After a certain sum has been earned by the contractor the Government participates in the profits. The use of Government aerodromes and hangars is granted to the contractor at fixed annual charges.

The announcement that the British Government has set aside £64,600 and 80 aerodromes for the encouragement of commercial aviation has made a deep impression in France.

The energy with which civil aviation is being developed in England is causing the French aircraft constructors to complain that they are being neglected by the financiers and commercial business men. The starting of a London-Paris air service on the first day that flying was allowed between the two countries seemed to come as a surprise.

In the "Temps" of Aug. 25th the following appears :—

"We congratulate our friends on the other side of the Channel on their rapidity. At the same time, we regret that no French organisation is capable of such swift realisation. There seems to be a lack of *liaison* between our directors of aeronautics and our French industrialists, whereas in England the parties interested were informed of the negotiations between the two Governments long beforehand. Proof of this is to be found in the publication made last week in numerous English journals of the whole organisation for this service. Once more our French industry has been placed in a situation of manifest inferiority."

It is now known that the failure of the Farman aerobus "Le Goliath" to reach Dakar on Aug. 13th was due to the shearing of the bolts securing the right propeller, while the machine was flying along the coast at a point about 90 miles north of St. Louis, Senegal. For 35 minutes the flight was continued with the starboard engine running alone. This engine overheated, and it became necessary to land on a patch of sloping beach when the tide was high. The machine after landing ran into the sea and was badly damaged. The crew were alone for six days before parties of natives from neighbouring villages discovered them. They had a limited quantity of food in their possession, and water was obtained by distilling sea water.

The Commission Sportive Aeronautique announced that all claims (presumably by French pilots only) for records said to have been established during the war must have been submitted to them before Aug. 31st last.

At 5.30 a.m. on September 1st Poulain (the cyclist who recently flew fifteen yards in an Aviette), was to have made an official trial on the Longchamps racecourse, before members of the Aero Club. Unfortunately the machine was damaged before the trial began.

HOLLAND.

E.L.T.A. NEWS

H.M. Queen Wilhelmina and the Prince Consort paid a visit to the E.L.T.A. Exhibition at Amsterdam on Aug. 27th. They viewed the stands in the Exhibition. Demonstrations were given by several pilots, among whom were Mr. W. R. Kenworthy, Major Draper, and Capt. Hinchcliffe. The last-named pilot smashed the right wing of his machine when landing.

The E.L.T.A. still proceeds in fairly lively fashion, at least, so far as the flying is concerned, performance in eating and drinking showing a marked decline since the opening days.

On the 28th the B.A.T. Limousine, piloted by Major Draper, and containing Mr. Koolhoven and Mr. Lawford, the Airco pilot, departed for London against a gale. It duly reached its destination in 4½ hours, including a stop at Marquise. The weather conditions were such that the passengers had to rig up a rope arrangement en route to hang on to. The return trip was made on the following Saturday, the passengers being Mr. Koolhoven, Mr. and Mrs. Wallace Barr, and Commander Ramsey, U.S.N. The time taken from London to Soesterberg was 2½ hours.

Further arrivals during the week were the Vickers commercial "Vimy," piloted by Capt. Cockerell, a Caproni biplane, "'commercialised" by the addition of a glass house for 10 people on the fuselage, a 2-seater Morane "Parasol," two Portuguese Bréguets, and a Morane monoplane, piloted by Fronval. The latter is putting up some exceedingly fine shows of trick flying.

On the 25th the sensation of the day was provided by the arrival of a Caproni triplane, complete with omnibus attached, containing a further detachment of the Italian Flying Corps, numbering about 16. On the roof, which is formed by the original nacelle, six more persons, including the pilot, are established. It was met over Amsterdam on arrival by the big B.A.T., which made circles round it till the descent took place.

A competition in stunt flying was held on the 26th, a committee of ladies forming the judges. There were 10 competitors. The result was a win for Major Draper on the B.A.T. "Bantam," Mr. Kenworthy, on the "Kangaroo," being second, while Mr. Duke, on the "Bantam," and Ferrarin, on the Italian "Balilla" (a S.V.A., with ordinary single bay bracing), tied for third place. A very amusing performance was given by Capt. Hammersley on the Avro "Baby," which, however, appeared to make more impression on expert spectators than on the judges.

The "Kangaroo" and the five Avros are steadily working through their daily queue of passengers in fine style. The big B.A.T. has made a good many flights, with important passengers, top-hatted representatives of the Dutch Government evidently appreciating the comforts of the cabin.
—R. B. N.

On August 29th the public swarmed onto the landing-ground at Winschoten, Groningen. Captain Hinchliffe, with three passengers, in an Avro machine, attempted to land there. Two spectators were killed and three injured.

The North Sea Aerial Navigation Company of Olympia, Leeds, are carrying passengers at the E.L.T.A. Exhibition in Blackburn "Kangaroo" machines. Sixty to seventy passengers are carried daily.

Flights between Amsterdam and London are to be arranged when the demand justifies them.

In the issue of THE AEROPLANE, dated August 20th, it was stated that a company had been formed for air transport in Holland. Vickers Ltd. have some interest in it. According to the "Haagsche Courant" of August 30th regular air services in Holland will be started next spring. The machines to be used will carry two, three and twelve passengers. Twopence each will be charged for carrying letters in Holland, and fivepence to England.

ITALY.

The Italian correspondent of THE AEROPLANE writes :—

The Seaplane Circuit of Sicily, promoted by the Automobile Club of Sicily, and the great sportsman, Chev. Florio, is to take place on or about Sept. 14th. The pilots are to be men who actively participated in the defence of Sicilian

coasts during the war. The French pilots from the Marsala Escadrille are, of course, included in this category.

It is rumoured that a 3,000 h.p. C.A. triplane may yet visit Amsterdam in time for the E.L.T.A. Exhibition.

There is news from Naples of a new enterprise in the completely civilian line. Signor Baliero and Doctor Longo are reported to have alighted there with the first of a batch of aviatics (one presumes S.A.M.L. brand) to set up a flying school with a passenger-carrying and trip department.

The Association of Aviators and Aeronauts of Italy held the first of a long projected series of fêtes for popularising flying on Aug. 24th at the Ansaldo flying ground at Turin. Everything was excellently done.

It is announced that Japan is placing contracts for the supply of large numbers of single-engined aeroplanes in Italy.

Further detailed news of the Rome-Pekin SVA Reliability Squadron trip being organised by D'Annunzio has been communicated to the Press.

Of the five machines starting, three will carry a passenger each. The other two will take luggage containing spares, food and comforts, which will be sent down by parachute to any pilot forced to land in an unaccessible position. Should a pilot go down in a place where landing is possible, one of the luggage machines will descend, throw out the luggage and take the pilot on board.

The length of the trip is about 10,500 miles, and it is to be made in 19 stages in 12 days. Engines may be changed at Bassora, Calcutta, and Shanghai.—T. S. H.

Reuter states that on Aug. 27th the steamer "Nippon" left Spezia for Tokio. It is carrying spare parts of aeroplanes and aeronautical instruments which will be unloaded at various points on the route to be followed by the squadron of Signor d'Annunzio on their flight to Tokio.

A Caproni aeroplane crashed near Vienna shortly before noon on Aug. 23rd.

The machine had taken off from the aerodrome at Aspern to fly to Rome *via* Turin, when it fell to the ground from a less height than 1,000 ft., and was totally wrecked. The occupants, a pilot, a mechanic, and two officers of the Italian Armistice Commission, were killed.

NORWAY.

The Danish correspondent of THE AEROPLANE writes :—

A number of fishermen on the west coast of Norway have combined to buy a seaplane to go in search of the herring shoals; their choice is a German Brandenburg three-seater, with the naval Capt.-Lt. Christiansen as pilot.

Having bought a new and larger Curtiss flying-boat the Danish-American millionaire, Mr. Larsen, sold his small flying boat of the same make, which was piloted by Capt. Batts, and engined by a Curtiss 6-cyl. vertical type aluminium motor, by auction at the Norwegian capital. Although it cost £3,300, only £1,000 was obtained from the Christiania firm, "Norsk Luftkraft," who are using it for their new flying school.

This firm has already been referred to. It was inaugurated at Gardermoen with Lieut. Haganæs as manager and Lieut. Vogt as instructor. They have six 70-h.p. two-seater Caudron school machines, and three Avros for advanced training. They were all bought in England and tested by a British lieutenant, whose elegant flying drew much admiring comment. The school is attended by 50 pupils at a fee of £111.

SWEDEN.

On August 26th the Austrian Lieut. Ebner put up a new Scandinavian altitude record of 17,100 feet with two passengers, at the Thulin aerodrome in Ljungbyhed, presumably on a Phœnix aeroplane.

SWITZERLAND.

Taddeoli on the S.I.A.I. is continuing the exhibition flights for which he flew that machine to Lake Geneva. He has been flying over the Rhone valley end of the lake with passengers at great heights, thereby showing his caution.

Lts. Comte and Mittelholzer recently flew from Dubendorf to Samaden *via* Ragaz Oberhalbstein and the Magna and Berniria mountains. The affair was organised by the St. Moritz hotel people, who hope that when that lake is frozen —usually late in November—many landings will be made there.—T. S. H.

The Federal Council have partially modified the Decree of 1914 which forbade flights over Swiss territory. Though the Aerial Code is not yet definitely binding, permission to fly will be accorded to aviators willing to pledge themselves to observe certain conditions.

Lt. Pillichody, who flew to the summit of the Jungfrau on Aug. 19th last, was unable to attempt to leave for three days owing to the prevailing high wind. On Aug. 22nd he made an attempt, but was brought down by a gust of wind a few feet after leaving the ground. His machine fell into the snow and was seriously damaged.

Major Isler, the Chief of the Swiss Military Aviation Department, has announced that a new sport will be possible for tourists in the Alps next summer. He calls it "Alp-climbing by Air." Landing-places will be made on or near the summits of mountains, such as Mont Blanc.

Tourists will be able to make the trips by aeroplane in a very short time. At first the charges for these trips will be high, but they will be gradually reduced.

Private companies will be formed shortly for Alpine aviation.

SOUTH AMERICA.

The L.A.L.T.A.—Latin Alliance for Aerial Transport in South America—is doing well, especially in Brazil.—T. S. H.

UNITED STATES OF AMERICA.

At the start of the Aerial Derby from Toronto on Aug. 25th a Curtiss Oriole machine, piloted by Rholfs, turned on its back and delayed the start.

The first machine to arrive at Mineola, New York, from Toronto, was piloted by Coombs, and landed at 7.11 p.m. on Aug. 25th. Two other aviators landed a few minutes later. They were the only competitors to arrive from Toronto on that date, and started on the return journey on the next morning.

Colonel Barker, V.C., was the first to complete the flight from Toronto to New York and back. He was flying a Fokker, and finished the circuit at 9.35 a.m. on Aug. 27th.

None of the 40 machines which started from New York on Aug. 28th reached Toronto on the same day. Eight stopped the night at Syracuse and 16 at Albany. The remaining 16 had to land where they could.

Four machines reached Toronto from New York on Aug. 26th. The first machine to arrive back at New York was piloted by Lieut. Plumb. who, with two other aviators, reached there on the evening of Aug. 26th.

Eight machines completed the circuit at New York on Aug. 28th. Bad weather at Toronto and several crashes detained the others. A De Havilland has been missing since it left Buffalo for Toronto on Aug. 27th. It is feared that the aviators have fallen into Lake Ontario and perished.

Lieut. Maynard, a United States army officer, won the aerial Derby between New York and Toronto. Flying a D.H.4 fitted with a Liberty engine he covered the 1,042 miles in 7 hours, 45 min., 15 sec. flying time.

Two other American officers, Lieuts. H. H. George and D. B. Gish, also in D.H. machines, were respectively second and third in 8 hours 40 min. 5 sec. and 8 hours 44 min. 15 sec.

The winners, under the United States army regulations, cannot accept the cash prizes, which will go to civilians who made the next best time. Lieut. Maynard, however, will receive the Canadian Exposition trophy for the fastest round trip, and the Aero Club of Canada trophy for the Roosevelt Field entrant, making the best time one way, which he did in 3 hours, 20 mins., 45 sec.

During the six weeks, ending Aug. 2nd, 56 fires were discovered in the California forests by the aerial forest fire patrol. The fires were reported promptly and quickly extinguished, having caused only nominal damage.

The corps of aviators from the three flying stations, Mather Field, Sacramento; March Field, Alessandro; and Rockwell Field, San Diego, have made 373 flights over the forest, covering a distance of 45,376 miles.

The U.S. Army Balloon School at Arcadia have kept a balloon up all day and night, and have discovered and reported many fires.

The Director of Air Service had authorised on Aug. 5th the extension of the forest patrol over parts of the Oregon forests. The headquarters have been established at Salem Ore, where eight aeroplanes will be stationed.

The U.S. Department Agriculture Weather Bureau has prepared a map of the United States divided into 13 zones. Weather forecasts are made in each zone at 9.30 a.m. and 9.30 p.m. to cover 24 hours. These forecasts were available for aviators and balloon pilots from Aug. 10th.

Similar forecasts have been made with the country divided into seven zones since July 21st with very satisfactory results.

The Superintendent of the Western Division of the New York-Chicago Air Mail has stated that the service will be extended from Chicago to St. Louis in about the middle of September. The distance is approximately 400 miles, and will be covered in a single flight from Chicago.

One of the new Curtiss H.A. mail machines recently broke all records on a stage of the New York-Chicago air mail service. The speed averaged 120 m.p.h.

This machine was built for the Liberty engine. It carries 900 pounds of mail, and in a test flight attained a speed of 145 m.p.h. with a full load.

The Philadelphia Aero-Service Corp has started commercial aerial transport. The aerodrome is situated in the suburbs of Philadelphia. Four aeroplanes have been purchased and a flying school has started.

Reliability

LODGE

SPARKING PLUGS

have achieved such a reputation for reliability that it is diffiult to imagine the one-time faultiness so common in sparking plugs. It is not merely a case of "War Necessity being the Mother of Invention," since pre-war Lodge plugs were doing much to remove the impression that a reliable plug was impossible. It is only natural though that the latest designed and employed for war service should be still better.

"Use them and you will prove this."

Write for particulars.

C. F. Kilner, D.S.O., Capt. C. E. H. Rathborne, D.S.O., Capt. I. T. Courtney, O.B.E., Capt. A. G. Bishop, A.F.C., Aug. 1st.

ADMIRALTY APPOINTMENTS AND PROMOTIONS.

The following appointment has been made:—

SEPT. 1st.—WT. SHIPWTS.—E. E. Back, to "Argus."

* * *

Reports from Viborg state that a violent bombardment was heard there on the 27th ult. lasting for two hours, from the direction of Kronstadt.

It is supposed that the British Naval and Air Forces were in action. Thick clouds of smoke were seen afterwards above Kronstadt.

It is officially reported that an aeroplane coming from Kronstadt appeared over Terijoki recently and dropped six bombs, which, however, caused no damage.

THE BAKER AIR SEXTANT

The perfection of this instrument is a triumph of British science and mechanical skill and accuracy.

HUSUN

REGD. TRADE MARK

The great reputation which "Husun" aeronautical instruments quickly gained surprised nobody who knew the fame that "Husun" instruments have had for generations among the world's navigators.

We claim for our instruments the highest possible accuracy and reliability. We can offer quick delivery of the

Latest Improved Nautical and Aeronautical Instruments of Navigation

Makers of Military Compasses and Drawing Instruments. Marine Opticians and Chronometer Makers to the Admiralty, War Office, and Air Board.

603. Magneto Spanners. Made from best quality tempered STEEL. Oxidized 6d. each.

How
TERRY
experience counts.

WE tackle our tasks scientifically. For 63 years we have been studying materials, testing methods, and adopting the best, our experience has proved. And to-day, we have a highly skilled organization, every phase adopted only after much experiment. May we quote for your needs?

Herbert Terry & Sons, Ltd.
Manufacturers,
Reddith, Eng.

TRADE MARK

By Special Appointment *To H.M. the King.*

GIEVES
LIMITED

Royal Navy House
21 Old Bond St. W.1
(Piccadilly End)

ROYAL NAVAL OUTFITTERS
and
SPECIALISTS in R.A.F. KIT

"Gieves" Special Royal Air Force Department, reserved for the exclusive use of R.A.F. Officers, provides a large and varied range of everything appertaining to R.A.F. Kit. All the best quality and style at moderate prices.

ANYTHING A MAN WANTS HE CAN GET IT AT "GIEVES"—whether it be for service or civilian use. EVERYTHING FOR MEN'S WEAR.

The WHEELER
Pocket Height and Weather Indicator

For Aerial Passengers.

THIS instrument is designed for use of aviators. It indicates the exact height at which the Aeroplane is flying and is of great **interest and value to all who fly.** Furthermore it has the additional advantage of indicating the weather for general use—it is, in fact, a pocket barometer. The instrument is made in watch form, gilt or oxydized case, and supplied in solid leather outer case in a secure and convenient form for the coat pocket.

Two sizes: Diameter 1⅝" Diameter 2¼"

Aircraft and motor accessory firms are invited to apply for terms.

Can be supplied with luminous dials if desired

T. WHEELER
(Established 1878),
Manufacturer of Aneroid Barometers & Scientific Instruments,
217, GOSWELL ROAD, E.C.1,
Contractor to H.M. Government, Air Board and Meteorological Office, etc.

VENUS PENCILS

VENUS PENCILS

set the world's standard for fine pencils. Every one of the 17 degrees are perfect. The degrees which will give you the best results for your work are :—

For Engineers HB, 2H, 4H, 6H, 8H.
For Draughtsmen 4B, 2B, HB, 2H, 4H, 5H.

Of all Stationers, Stores, etc., throughout the World.

"VENUS," 173-5, LOWER CLAPTON ROAD, E.5.

Write for a copy of our interesting Booklet "The Venus Pencil in Mechanical Drafting."

(To be continued.)

THE AIR FORCE DECORATIONS.

The Air Ministry made the following announcement on Aug. 28th:—

His Majesty the King has been graciously pleased to approve the ribbons, as described below, being substituted for those at present in use.

DISTINGUISHED FLYING CROSS.—One inch and a quarter in width; violet and white alternate diagonal stripes, each of one-eighth of an inch in width, running at an angle of 45 deg.

AIR FORCE CROSS.—One inch and a quarter in width; red and white alternate diagonal stripes, each of one-eighth of an inch in width, running at an angle of 45 deg.

DISTINGUISHED FLYING MEDAL.—The same as that for the D.F.C., except that the diagonal stripes are one-sixteenth of an inch in width.

AIR FORCE MEDAL.—The same as that for the A.F.C., except that the diagonal stripes are one-sixteenth of an inch in width.

The ribbons will be worn one half-inch in depth, the diagonal stripes running downwards from the centre of the tunic towards the left, and will be so arranged that:—

(1) Distinguished Flying Cross or Air Cross ribbon will show at the top corner nearest to the left arm, and at the bottom corner nearest to the centre of the tunic, triangles of equal dimensions of violet or red, as the case may be.

(2) Distinguished Flying Medal and the Air Force Medal ribbon will show at the top corner nearest to the left arm a triangle of white and at the bottom corner nearest to the centre of the tunic a triangle of equal dimensions of violet or red, as the case may be.

(3) The order of precedence will be the same as at present.

The new ribbons should be worn as soon as practicable by all officers and airmen awarded the decorations. The ribbons are now available, and a free issue will be made to those awarded these decorations.

In the case of demobilised officers and airmen, application for the ribbon should be made to:—

(1) Officers:—The Secretary, Air Ministry, Kingsway, W.C.2.

(2) Airmen:—The Officer i/c Records, Royal Air Force, Blandford, Dorset.

THE COLOGNE AERIAL MAIL.

The Air Ministry announced on Aug. 27th that:—

During the week ending Aug. 16th the R.A.F. aerial mail service from Lympne to Cologne carried no less than 7,090 lb. of letters and postal packets.

The service is carried on by two squadrons Nos. 18 and 120. The former is using D.H.9a machines with Liberty engines, and is working from the Cologne terminal, while the latter is equipped with the D.H.9 type with B.H.P. engines and works from Lympne.

The average time taken by machines of No. 18 on the journey is 3 hr. 14 min., while No. 120 with rather less powerful engines average 3 hr. 23 min.

The intermediate stage at Maisconcelle is now cut out, and the machines fly through without a stop. Out of 45 trips commenced, only in one case was there failure to complete the journey. The average weight carried per journey was 161 lb.

* * *

The R.A.F. aerial postal service established between Lympne and Cologne was discontinued on Sept. 1st. In view of the rapid demobilisation of our forces in Germany it was not considered necessary to continue the aerial post, especially as the service involved the maintenance of a number of wireless and directional stations.

* * *

The Air Ministry announces that the Royal Air Force landing-ground at South Denes (Yarmouth), has been relinquished.

* * *

A British aeroplane, while on its way from London to Bombay, fell into the River Capeau on Aug. 27th, near Salins d'Hyères. The crew of the machine, a Lieutenant and a Serjeant, were uninjured, and the machine was discovered to be very little damaged. The pilot is said to be one Lieut. Henfrey.

* * *

The recent raid on Kabul was carried out by the Handley Page machine, which, under the pilotage of Major MacLaren, R.A.F., with General McEwen, as a passenger, flew from England to India last January. The pilot on this voyage was Capt. Halley, R.A.F.

The machine started from Risalpur, and the distance flown was 400 miles, and apparently 8,000 ft. was the greatest altitude reached, and that only to pass over one ridge. The aeroplane remained over Kabul for 10 minutes, and the bombs dropped are stated to have caused a great deal of damage and panic among the people. The flight lasted six hours.

that their employment will end in a few weeks. It is stated that only those willing to reside in camp will be retained.

* * *

An empty aeroplane, partly submerged, was found floating in the Solent near Yarmouth on August 29th. It was picked up by a War Department vessel.

It is thought that the machine possibly is one which, piloted by Capt. Cockey, R.A.F., fell into the Solent while on a flight from Plymouth to Southampton. Capt. Cockey was picked up unhurt by a yacht.

THE ARGENTINE.

An aerodrome was purchased at Buenos Aires by the Italian Government for the use of the Italian Air Force Mission some months ago. With the hangars and some of the aeroplanes, it has now been presented to the Argentine Government.

DENMARK.

The Entente Legations at Copenhagen have sent a Commission to inspect 90 German aeroplanes which have been bought by a Danish firm. The aeroplanes are in the hands of the Customs officials at Vandpupo. It is thought that these machines, which are new and bear Germany military marks, have been sent to Denmark in order to evade Article 202 of the Peace Treaty.

GERMANY.

It has been reported from Berlin that from 12 to 16 of the German airships that were to have been handed over to the Allies according to the provisions of the Peace Treaty have been destroyed by a young German naval officer.

The most circumstantial account has been sent from Berlin by Karl Wiegand, special correspondent of the Universal Service of America, whose message appeared in the "Daily Express" of Sept. 1st. In the course of his article, he said:

"About 16 Zeppelins were left of the 90 built during the war. The Peace Treaty provides for their surrender to the Allies. One, the Z72, is not completed, and is still intact at the Zeppelin works at Friedrichshafen. The other 15 were at various air harbours, chiefly in Northern Germany in the vicinity of the North Sea and Baltic coasts. Ten or 12 of the latter are said to have been sabotaged, and for all practical purposes are as good as destroyed.

"The naval officer, whose name has not yet been made known, acting, it is alleged, entirely on his own responsibility and initiative, is said to have ordered the cables by which the huge Zeppelins were suspended in their sheds to be cut, causing the airships to crash to the ground, crushing gondolas and engines, and twisting and bending the framework in such a way that they can be considered as good as 'sunk.'

"There is reason to believe that a plan to prevent the Allies getting the Zeppelins has been in contemplation in certain circles for some time. Indications suggest that the Government had no knowledge of the plan. The officer responsible is reported to have disappeared, but confirmation of this has not been obtained.

"One statement is that three of the oldest and obsolete type in sheds near the Baltic coast are unharmed. It is not yet certain whether the Z71, the last and largest Zeppelin completed, and one of those that attacked London, is among the airships wrecked.

"Something akin to consternation reigned at the Foreign Office when the report became known there. It is emphatically denied that the Government could have had any knowledge of it. On the contrary, officials saw only an attempt by certain elements to embarrass and make further trouble for the Government.

"In answer to my request for a statement, I was told at the Foreign Office that immediately the matter became known there the Government began an inquiry. The deed, it was stated, could only have been that of an irresponsible individual, who would be proceeded against as soon as it could be ascertained who was involved.

"In Nationalist circles the act is condoned as patriotic, whatever the consequences, and is compared to the sinking of the German Fleet at Scapa Flow."

ITALY.

If rumour is to be trusted, the Army rigid airship M6 is in September to fly from Rome to Brussels and back *via* Milan and Paris.

The Italian correspondent of THE AEROPLANE writes:—

Now that the Tripolitan rebels have been reduced to accept peace, the squadrons are turning their attention to postal work. It is officially communicated that the squadrons using C.A. machines are carrying on a coastal post service from Tripoli to Homs and Zuara. The F.B.A. people are doing the same from Tripoli to Sirte. Some sensational flights are being organised as well. Nothing seems to impress the Arab mind so much as speed.—T. S. H.

NORWAY.

On Aug. 29th Lieut. Jordan took Lieut. Stokke up in an Army Farman aeroplane at Vaernebmeren, near Trondhjem. When the machine had risen to about 50 metres it received a bad bump, got out of control and crashed. The petrol tank exploded on the machine hitting the ground. The machine burst into flames, and the aviators could not be rescued.

POLAND.

The first biplane built entirely by the Military Aeronautical Establishment at Warsaw is of the Roland type and passed its first flying tests at the Mokotow Military Aero Park on Aug. 22nd.

Reuter states that an American aviation squadron is being formed in Paris with the object of aiding the Poles in their fight against the Bolsheviks. Major Fauntleroy and Captain Cooper have received official authorisation from General Rosvedowski, head of the Polish Military Mission, to form a squadron which will consist of aviators who, like themselves, have seen service in the Air Force of the American Army. The squadron will be christened the Kosciusko Squadron, after the Polish national hero, and is expected to leave for Poland about Sept. 15th.

RUSSIA.

It is believed that a French aviation detachment has arrived at Krasnoyarsk, Siberia. The detachment will co-operate with Admiral Koltchak's Forces.

SPAIN.

The Ministry of War has ordered a large number of aeroplanes from the Caudron firm.

According to the "Times" of Sept. 1st, 20 aeroplanes are to be bought for the instruction of aviation pupils.

On Aug. 23rd and 24th a Spanish aviator dropped bombs on the fondak of Wadras in Spanish Morocco. On the 23rd two soldiers of Raisuli's regular army were killed, and five bombs were dropped. On the 24th 11 bombs were dropped, but there were no casualties.

The tribesmen state that the aeroplane was armoured, apparently because, although flying low, they could not bring it down. The actual type of machine is not known.

PERSONAL NOTICES.

NAVAL.

ENGAGEMENT.

COMPSTON—BARCLAY.—A marriage is arranged, and will shortly take place, between Capt. R. J. O. Compston, D.S.C., D.F.C., R.A.F., younger son of the Rev. H. F. Compston, Fellow of King's College, London, and Nina, only child of the late Arthur Hayward Barclay, Captain, 18th Hussars, and adopted daughter of Lieut.-Col. Hubert F. Barclay, of Essendon Close, Hatfield, Herts.

MILITARY.

DEATH.

KANN.—Capt. Raymond Victor Kann, R.A.F., who was killed in a flying accident at Stonehenge on Aug. 21st, at the age of 22, was the elder surviving son of Mr. and Mrs. R. Kann, 37, Lancaster Gate, and was married on June 19th last to Dorothy, the youngest daughter of Mr. and Mrs. Percy Love, Adelaide Road, Hampstead.

ENGAGEMENTS.

BALFOUR—SHEPPERSON.—The engagement is announced between Major Harold H. Balfour, M.C., late 60th Rifles and R.A.F., second son of Colonel and Mrs. Nigel Harington Balfour, of Belton, Camberley, and Barbara, only daughter of Claude A. Shepperson, A.R.A., A.R.W.S., and Mrs. Shepperson, of 5, Mulberry Walk, Chelsea.

ELLVERS—ELLIOTT.—The engagement is announced between Lieut. Victor Ellvers, R.F.A. and R.A.F., son of the Rector of Melbury Abbas, Shaftesbury, Dorset, and Audrey Guest, daughter of the late Mr. George Elliott, K.C., and Mrs. George Elliott, of 54, Cheyne Court, Chelsea.

GODDARD—BERNARD.—A marriage has been arranged between Capt. H. E. Goddard, R.A.F., late East Yorkshire Regt., younger son of Colonel W. F. Goddard, V.D., J.P., D.L., and Mrs. Goddard, Thwaite House, Cottingham, near Hull, and Enid Bernard, daughter of the late Mr. Edmund Bernard, J.P., and Mrs. Bernard, Snakemoor, Botley, Hants. The ceremony will take place very quietly in the country on Sept. 16th.

KINGSCOTE—PAUL.—The marriage arranged between Lieut.-Col. A. R. F. Kingscote, M.C., Royal Artillery, and Mrs. Percival Paul will take place at St. Margaret's Church, Westminster, on Tuesday, Sept. 9th, at 2.15 p.m.

BIRTH.

GRANDAGE.—On Aug. 29th, at "Edinburgh House," Brockhurst Road, Gosport, Hants, to Winifred (née Foster), wife of Norman A. Grandage, A.M.I.Mech.E. (Lt. R.E. (T), attd. R.A.F.)—a daughter.

ON THE INTERNATIONAL AIR NAVIGATION CONVENTION.

Owing to the intervention of matters of greater immediate importance, comment on the International Air Convention which was published some weeks ago has perforce been postponed. It is now possible to return to the subject.

Taking it all round, the International Air Convention is a very fine affair, but there are in it what appear to be some appalling snags, which if they do not in years to come develop into actual *casi bellorum* will at any rate give rise to "diplomatic incidents" of some importance.

As that entertaining person the "Lincoln Imp" has already indicated, the High Contracting Powers have agreed that the air over each State belongs to that State. This is not an admission of the *usque ad cœlum* doctrine, but rather the institution of the doctrine as an international law. Its installation as such does not in the least entail its acceptance in an ordinary court of law for private consumption. So we can still fly with impunity over our neighbour's land.

Incidentally those who recall the "Imp's" great discovery that the *usque ad cœlum* doctrine has never been the law of the land will remember that all the precedents quoted in support of the doctrine referred solely to the ownership of trees, or birds in the trees, over certain land. In fact, the only applications of the doctrine which carried any legal weight seemed to imply that *cœlum* did not mean *heaven*, but merely what aviators understand by the word *ceiling*, that is to say the *highest reachable level*.

Thus the "ceiling" of a land-owner is merely the tops of his own trees. If this fact were ever established in a court of law, or if the Air Ministry had the pluck to make a regulation that anybody is at liberty to fly over anybody's land so long as he is above the owner's "ceiling," a whole lot of trouble would be saved, and yet the *usque ad cœlum* doctrine would be vindicated.

In International Law, on the other hand, there can be no doubt whatever about the ownership of the air. It is now agreed that "every State has complete and exclusive sovereignty in the air space above its territory and territorial waters." So that's that, and it is very necessary to remember it, for according to the wording of Article 1, Chapter 1, of the Convention the Law applies just as well to the air space above the territory of States which do not agree to the Convention as it does to States which sign it.

A Suppositious Case.

Thus, for example, if the free and independent Republic of Andorra refused to agree to the Convention and announced that it would not have the aeroplanes of other nations flying over its territory, there would be nothing to prevent it from organising an anti-aircraft corps and turning its Archie batteries onto any aeroplane which trespassed in its air space. If an aeroplane of foreign origin were brought down, and if the occupants were killed, it seems that no action would lie against the Government of Andorra. As a Sovereign State it would be within its rights in compelling respect for its own laws. In such a case the whole State would be a prohibited area, and the Andorran Archie-gunner would have as much right to shoot as would a British Archie-gunner who fired on an aeroplane flying over Woolwich or Spithead.

One does not on this account recommend demobbed Archie-gunners to dash straight off to Andorra (if they can find it on the map) and offer to organise an Andorran Air Defence Area, even though the said A.A.D.A. might be concocted after the latest recipe for L.A.D.A. *à la* Ashmore. They might be very welcome, and they would probably find out that Andorra's objection to aircraft was largely due to the fact that Andorra was not large enough to contain an aerodrome, and, moreover, that Andorra being mostly vertical, it would be impossible to find a flat place even if there were room for it, and that so the Andorrans, being mountaineers of a sporting nature, had decided to have a little aeroplane shooting, as a change from eagle and ibex.

But, the Archie-gunner would soon find himself in trouble, for he would also find that he could not fire at an aeroplane without his splinters and duds falling into the territory of other Sovereign States. It is alleged that Andorra once bought a Creusôt gun but has never fired it because if it were fired it must inevitably hit either France or Spain.

Nevertheless, without Andorra's consent you must not fly over Andorra. That is assuming that Andorra is anywhere on a line from anywhere in France to anywhere in Spain between which points anyone would want to fly. Which one doubts.

Prohibited Areas.

There is in the early part of the Convention one rather sportsmanlike clause which deserves attention. Article 3 says:—"Each contracting State has the right, for military reasons or in the interest of public safety, to prohibit the aircraft of the other contracting States, under the penalties provided by its legislation and subject to no distinction being made in this respect between its private aircraft and those of the other contracting States, from flying over certain areas of its territory."

That is to say an Archie-gunner protecting the Woolwich or Sheerness prohibited area has a perfect right to shoot down a French, Belgian, Czecho-Slovak or Jugo-Slav machine which flies over his area. But, he must, in common decency and fair play, also shoot down the next British machine which flies over his area—that is unless he is merely a temporary officer and gentleman.

Foreign air travel is evidently not going to be such a haphazard affair as foreign motoring used to be, for one reads further in Article 4 that "Every aircraft which finds itself above a prohibited area shall, as soon as aware of the fact, give the signal of distress provided

in Paragraph 17 of Annex D, and land outside the prohibited area as near to it as possible and as soon as possible at one of the aerodromes of the State unlawfully flown over."

Apart from the horrid grammar of that article one is put in doubt as to its precise meaning. Presumably it will be left to the local Archie to notify the offending aircraft whether it is over a prohibited area or not. Most pilots who fly over a prohibited area are diplomatically blind to its precise extent, and he would have to be a very conscientious person indeed who would take the trouble to land and report himself just because he found himself half a mile west of the famous chimneys at West Thurrock instead of half a mile to the east of them. And probably it would depend very much on the quality of Archie's shooting whether the pilot made the prescribed signal of distress or not.

But what is really fogging is the meaning of landing outside the prohibited area "as near to it as possible and as soon as possible at one of the aerodromes of the State flown over." Does this mean that the machine must land close to the edge of the prohibited area at once, and then land again at an aerodrome! Or does it mean that it must land as soon as possible at an aerodrome as near as possible to the prohibited area? And does "an aerodrome of the State" mean a Government aerodrome, or merely any aerodrome, private, public, or Government, near the prohibited area?

It strikes one that while a pilot was making up his mind what to do about it he would either be shot down or would be so far away on his journey that it would not be worth his while to land till he reached his destination. Also, be it remembered, under the Civil Aerial Transport regulations it is part of Archie's job to fire a warning shot if he sees an aircraft approaching a prohibited area, so there is nothing in the first shot to tell the pilot that he is doing anything worse than looking as if he were going to trespass over the sacred area.

Air Defence Areas.

On the whole it looks as if there is going to be quite a lot of quiet fun and probably a good deal of litigation over this question of prohibited areas. And certainly there is going to be heaps of work for the Archie-gunners and their searchlights and observer companies. In fact the protection of the prohibited areas in this country will demand the services of quite a large personnel.

Which seems to suggest that the excellent organisation which has been created under the G.O.C. and Staff of the London Air Defence Area ought to become a permanent institution for the defence of prohibited areas. There will certainly be plenty to keep it in even better practice than when it had only to deal with Hun raiders, and so it will become extremely expert in readiness for the next war.

Whether this Air Defence Force should be under the War Office or under the Air Ministry is an arguable point. Personally one inclines to the belief that it is the Air Ministry's "pidgin." The ground jobs might become in time a kind of home for officers whose flying days are done. The Home Defence squadrons that were (during the war) would become a species of aerial police to chase those who trespassed over prohibited areas and to take their numbers.

There may be reasons why such a force should come under the War Office, or even under the Admiralty. If so one would like those who think so to "give their reasons and draw a map." But in any case the Air Defence Force should now become a permanent institution.—C. G. G.

AN APOLOGY.

Our attention has been called to the article under the heading, "On the Harmsworth Press and the R.A.F. Vote," which appeared on page 654 in our issue of the 20th ult.

Messrs. Simmons and Simmons, solicitors to Brig.-General Livingston, inform us that the paragraphs under the sub-heading of "An Unfortunate Connection" have caused considerable annoyance to him owing to their defamatory nature.

We gladly take this opportunity of stating we had no intention of making any imputation whatsoever against the General. We unreservedly withdraw our remarks and offer to the General our sincere regret that the article appeared.

THE USE OF WIRELESS TELEPHONES AND TELEGRAPHS WITH AIRCRAFT.

The Air Ministry makes the following announcement:—

The form of licence to be granted for the use of wireless to and from aircraft, and the conditions under which such licences will be granted, are under consideration. In the meantime, pending the issue of the licence by the Postmaster General, temporary provisional authority for the installation and use of wireless apparatus in aircraft can be obtained, in approved cases, by application to the Secretary of the Post Office.

For the present the wave length suggested for wireless telephony is 480 metres. This is the wave length which the existing Air Ministry W/T Stations at present employ for work with aircraft.

For the benefit of designers and others interested, it may be said that the Postmaster-General's licence, when available, will probably contain provisions to the following effect:—

The sending apparatus installed at any aircraft station shall be constructed so as to be capable of using waves of 600 metres interrupted continuous wave, and 900 metres continuous wave; such of the following wave lengths, namely, 220, 300, 450 and 800 metres interrupted continuous wave, and 200-550 metres, 650-950 metres, 2,000-3,000 metres, continuous wave may also be used for transmission as are authorised in writing by the Postmaster-General.

The use of the wave of 600 metres (hereinafter referred to as the "aircraft-ship" wave) shall be confined to the use of the system known as "Interrupted Undamped Wave or Tonic Train, or I.C.W.," and the use of 900 metres hereinafter referred to as the "Aircraft Notmal Wave," shall be used only for continuous damped waves or wireless telephony.

Should an aircraft station be also fitted with a supplementary installation on long continuous waves, such installation shall be so constructed as to be capable of using the wave length of 2,400 metres.

The range of wave lengths for which the receiving apparatus may be constructed is not limited, but the apparatus must be capable of receiving on 600 metres and 900 metres, and on 2,400 metres when a transmitter working on this latter wave length is installed; it must also be made to embrace any other wave length on which a transmitter installed has been authorised to work.

The input of power to the licensed apparatus measured at the terminals of the power generator or battery shall not exceed 100 watts, provided always that when vacuum valves having heated filaments constitute a part of the sending or receiving apparatus, or both, the power employed for heating the said filaments shall be excluded in computing the said maximum input.

RELINQUISHMENT OF R.A.F. STATIONS.

It is announced by the Air Ministry that the following Royal Air Force Stations are to be relinquished and disposed of:—

Lowestoft (Balloon Base), Hicking Broad (Seaplane station), Bembridge (Seaplane Station), New Bembridge (Aerodrome), Seahouses (Aerodrome), Seaton Carew (Aerodrome), Marham (Aerodrome), Tynemouth (Aerodrome), Leadenham (Aerodrome), Upper Hoyford (Aerodrome), Usworth (Aerodrome), Helperby (Aerodrome), Ashington (Aerodrome), Scale Hall, Lancs. (Landing Ground), (after Oct., 1919).

GREAT BRITAIN AND FRANCE.

The Air Ministry announced on Sept. 3rd that in connection with the opening up of civil communication by air between Great Britain and France the French authorities have raised objections to the use of petrol and oil by civilian machines, which has been imported into France without payment of the ordinary dues, for military purposes. Aircraft companies and all others concerned must in future provide their own petrol and oil at Le Bourget through the ordinary commercial channels.

THE SCHNEIDER CUP ELIMINATING TRIALS.

The eliminating trials which were to have been held by the Royal Aero Club at Cowes on Wednesday, Sept. 3rd, to select the British team for the Schneider Cup proved rather a fiasco.

Three of the four entrants were known on Tuesday to be completed and to have taken the air. The Supermarine boat had not been out, and inquiries at Woolston on Tuesday evening showed that the machine had been delayed by the non-delivery of a propeller—due to a strike at the propeller makers—but that the missing article had safely arrived later on that afternoon, and that the last split pins in the propeller bolts were then being inserted. About 8 p.m. that night the Napier engine was given a run, and arrangements were made to take the machine out for a trial at 6 a.m. on Wednesday morning.

At six on Wednesday, Southampton was in a deluge, and the rain carried on steadily and hopelessly till nearly 11 o'clock, by which time the tide was too low to get the machine out at Woolston.

However, there was no doubt of the machine's readiness, and if the weather cleared sufficiently for the trials Major Hobbs was determined to be at Cowes for them.

Between Southampton and Cowes the steamer ran through steadily improving weather, and at Cowes at 12.30 there was no question of postponing the event on account of bad conditions. There was a light N. to N.E. breeze, no sea at all, and quite good visibility.

The Fairey with Clipped Wings.

Shortly after two o'clock an engine was heard approaching, and a seaplane appeared over Calshott making for Cowes. At first it was taken for the Sopwith—but it was soon recognised as the Fairey—fitted with clipped wings and a single row of struts at each side.

Lieut.-Col. Nichol made a very slow and perfect landing and taxied to the slipway at Saunder's yard. Just as the Fairey landed, a small flying-boat came in sight—which proved to be a three-seater Supermarine with 160 h.p. Beardmore, and not the Supermarine racer.

Then a small black speck on the horizon grew rapidly into the Sopwith racer—passed over, and landed on the East side of the harbour.

The landing was a fairly fast one, and the machine sank into the water in a quick and rather unhealthy looking manner, till the engine was opened up again, and the machine then made rapidly for the beach on the opposite side to the appointed rendezvous. It was brought over, Mr. Hawker sitting on the port wing tip, and a rowing boat under the starboard one, with floats nearly submerged and the tail plane awash.

On lifting the machine it was found that the starboard float was minus about 2 sq. ft. of bottom just under the rear chassis strut, and had, in addition, one or two minor holes, and that the port one was also punctured. Mr. Hawker's impression is that the main damage occurred at getting off at Hythe, and, in any case, the nature of the damage was such as to indicate that the float had hit something more solid than mere water.

A Bully Beef Tin.

After a long wait a motor-boat from Hamble brought over Mr. A. V. Roe, Capt. Hammersley, and Mr. Chadwick, who explained that the Avro had encountered a floating bully beef tin while getting off at Hamble, and had thereby been deprived of the step to one float.

Later a contingent from Woolston arrived, who explained that their three-seater boat had seen Mr. Hawker's mishap and had, therefore, concluded that the trials would be washed out, and they had, therefore, not brought their machine across.

Thereafter, Col. Nichol departed on the Fairey, Mr. Hawker returned by motor-boat with his two damaged floats to Hythe to collect a spare set. The Avro and Supermarine detachments returned to their homes and the rest of those present adjourned for tea.

So far as could be gathered upon the spot the Committee in charge of the trials, consisting of Col Ogilvie, Majors McClean and Mayo, and Lieut.-Commander Perrin, decided that the Fairey and the Sopwith are to be included in the British team, and that the Supermarine and the Avro should run a separate trial on Monday, Sept. 8th, to decide upon the third representative.

The Sopwith rising in Trials.

The Fastest Aeroplane One has Seen.

Of the two machines which did appear at Cowes it may be said at once that the Sopwith gives one the impression of being by far the fastest aeroplane of any type that one has yet seen. There is nothing freakish about it, it is very simple and clean in outline, and, in so far as a very small, light high-speed machine can be seaworthy, this should be. Therefore, given reasonably good fortune and fair weather, the Sopwith should win against everything.

The big Fairey—for it is a big machine, in spite of its 28-ft. wing span—looks capable of ploughing through anything in the way of a sea that a seaplane can stand up to, and it is not a slow machine by any means. If the gale that Mr. Fairey is hoping for does blow on Sept. 10th, his machine should put up an excellent show.

THE FRENCH AND ITALIAN COMPETITORS.

Yesterday (Tuesday), the Royal Aero Club stated that the two Nieuports (300 h.p. Hispano-Suiza), entered for the Schneider Cup race, had collided on the Seine. One was badly damaged and the other slightly. One of the machines, whether it is the slightly damaged one that had been repaired, or another, was not known, flew over and ran into a buoy, near Cowes, and was damaged, but it was expected that it could be repaired in time. Another machine was understood to be on the way, so that there may be two Nieuports in the race after all.

The Spad (300 h.p. Hispano-Suiza) and the Savoia (250 Isotta) were reported to have arrived.

THE AVRO ENTRY.

The details and dimensions of the Avro "Puma" racing seaplane entered for the Schneider Cup Race are now available.

They are as follows:—

Span of top wing	25 ft. 6 in.
Span of bottom wing	24 ft. 6 in.
Span of tail plane	9ft.
Height overall	9 ft. 9 in.
Length overall	21 ft. 4 in.
Chord of top wing	4 ft. 6 in.
Chord of bottom wing	4 ft. 6 in.
Chord of tail plane and elevators	3ft. 6 in. (mean)
Angle of incidence, top plane	1½ deg.
Angle of incidence, bottom plane	1½ deg.
Dihedral angle, top plane	0 deg.
Dihedral angle, bottom plane	3 deg.
Angle of incidence, tail plane,	adjustable from + 3 deg. to — 3 deg.
Area of main planes and ailerons	195 sq. ft.
Area of tail plane and elevator	28 sq. ft.
Area of rudder	5½ sq. ft.
Area of fin	8 sq. ft.
Loading of main planes	10.5 lb. per sq. ft.
Loading of engine (250 h.p.)	8.18 lb. per h.p.
Airscrew, "Avro"	8 ft. 6 in. dia., 8 ft. pitch, 2-blader
Petrol feed	pressure
Petrol capacity	25 gall.
Oil capacity	3 gall.
Water capacity	7 gall.
Controls type (machine)	joy-stick and rudder-bar
Controls type (engine)	single control
Weight bare (with water)	1,670 lb.
Weight loaded (pilot 170 : fuel and oil 279)	2,119 lb.

"SOME LOOP."

For some time past it has been a daily sight to see machines from the Cambridge School of Flying looping near Cambridge, and an Avro with its nose well down, preparatory to a loop, at once rivets attention. Recently the R.33 appeared over the town and suddenly put its nose down at a steep angle. A dear old lady in the crowd watching said excitedly, "Oh, look, it's going to loop the loop!"—G. D.

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

The Miss Douglas-Pennant Inquiry.

The inquiry into the dismissal of Miss Violet Douglas-Pennant from the position of Commandant of the Women's Royal Air Force will be opened at the House of Lords on Oct. 14th. The Chairman will be Lord Wrenbury, and the proceedings will be open to the public.

Miss Douglas-Pennant's statement of the case was filed at the House of Lords yesterday afternoon by her solicitors. Other persons interested are permitted to lodge statements up to Sept. 23rd, having an opportunity in the interval of seeing the exact nature of Miss Douglas-Pennant's complaints.

An Entertainment.

Major-General Seely, as Lord-Lieutenant of Hampshire, on Sept. 6th gave a luncheon to between 500 and 600 disabled sailors, soldiers, and airmen at Winchester Castle The King sent a message from Balmoral, in reply to a telegram from the gathering, stating that he much appreciated the loyal message from disabled men assembled to celebrate our victory, in which they had played so noble a part.

A Profitable Superstition.

According to the "Daily Mirror" many flying passengers are yielding to a superstition that if they throw a silver coin to earth as the aeroplane is ascending, luck will attend the flight. It is said that many passengers on the first of the Paris trips did this.

One wonders who was the enterprising groundsman who started this profitable idea.

168 Miles per Hour.

It is announced that Col. H. B. Clagett accomplished the feat of travelling from Washington to the Statue of Liberty in one hour and fifteen minutes on August 8th, at the rate of 168 m.p.h.

The flight was made in a De Haviland machine at a height of 4,000 feet. Sergeant Ralph Kratz flew with Colonel Clagett as a passenger.

The best previous record for the 210 mile flight was one hour and 24 minutes, or at the rate of 150 m.p.h.

To India and Back.

On Sept. 6th the "Daily Express" reminded its readers that the £10,000 prize for an Imperial Reliability Flight is to go to the entrant of the first aeroplane, seaplane, or airship which flies from England to India and back, and carries a load of at least a ton on both journeys.

The time occupied on either journey is not to exceed 12 days, and the return journey is to be begun within 14 days of arrival in India.

The competition is declared open as from May 1st, 1920, and will be closed on Oct. 31st, 1920.

The Advisory Committee, representing the Air Ministry, the Aeronautical Inspection Directorate, the Society of British Aircraft Constructors, the Royal Aeronautical Society, and the Royal Aero Club, at its second meeting expressed unanimous approval of the step taken by the "Daily Express" in offering the £10,000 prize for the return flight to India.

Entries are now in order, and should be sent to the Secretary, "Daily Express" Advisory Committee, £10,000 Imperial Reliability Flight, 3, Clifford Street, W.1. The fee for each entrant is £100.

Germany's Big Aeroplane.

Reuter reports that what is claimed to be the biggest aeroplane in the world is stated in the newspapers as having been built at the aviation works at Leipzig. It has made its first flight. It has a span of 134 ft., and is 69 ft. in length and 20 ft. in height.

It is equipped with two Benz motors of 500 h.p. and two of 250 h.p.

The aeroplane is capable of carrying a crew of six and 18 passengers with luggage.

Apparently, the Aviatic works are those to which the message refers.

How to obtain Efficiency.

The manager of a commercial aviation firm relates that at a northern aerodrome recently a pilot landed, paid the five shillings landing fee, and obtained the assistance of two airmen. In a few minutes he was ready to take off again, but only flew a few hundred yards before his engine failed. He looked round to beckon to the airmen and saw a Red Cross ambulance car rolling across the aerodrome with a number of W.R.A.F.s on board. The car stopped to pick up the two airmen and made off, leaving the pilot cursing on the deserted aerodrome. After much running about he discovered that it was one of the afternoons appointed for a mixed bathing parade and that until the ablutions considered necessary by the grandmotherly authorities had been carried out no more work would be done on that station.

It may be that one may live to see nationalised railways worked on the same principle and then one will occasionally find it impossible to obtain a ticket or the help of a porter because the equivalent of the adjutant has ordered a parade to teach the men on the establishment the arts of ticket punching and luggage smashing by numbers.

A Stunt.

Climbing on to a wing of an aeroplane flying 1,000 ft. above the Mersey near New Brighton Lighthouse on Sept. 6th, Professor F. Gadsby, a one-legged swimmer, jumped with a parachute.

As he was unable to free himself from the parachute he did not dive into the river as intended, but dropped gently and was picked up by a motor-boat.

The somewhat foolish stunt was cinematographed from another aeroplane.

Advice to Recruits.

The Washington Official News Letter has contained much advice to recruits. Recently it stated that :—

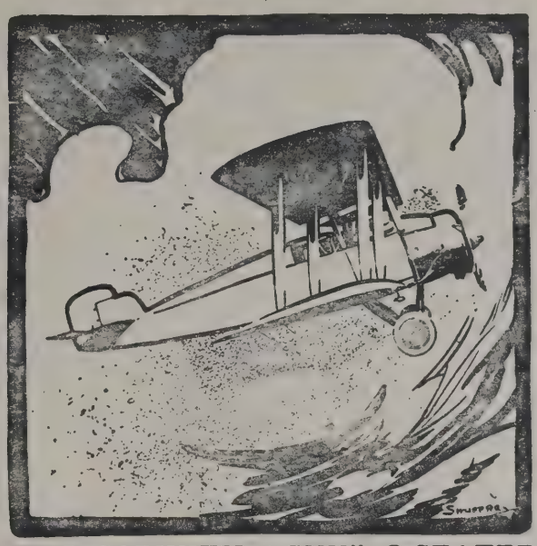
"The future commercial flying will, without a doubt, develop along the lines of lighter-than-air craft, and the man who goes into the balloon and airship game now and takes advantage of his opportunities will, at the end of a three-year enlistment, be able to step into a new field of endeavour in civil life, where, with a thorough knowledge of machines, gas, cordage, fabrics, or rigging, he will meet with no such competition as the airplane mechanic, whose training does not cover such a variety of phases of air navigation.

"That commercial airships are soon to become as ordinary a sight in the air as army airplanes are at present is an assured fact, as all of the balloon manufacturers in America and abroad are planning and actually building airships from a small "sport model" two-passenger ship up to the enormous 10,000,000 cubic ft. ship, fitted out for a world cruise with all the conveniences of an ocean liner. It is a new field that is only now opening up. The man who contemplates entering the air service and neglects to look into the airship (lighter than air) opportunities now offered him will be as short-sighted as some of those old conservatives who stayed in the bicycle game when automobiles first came into use."

The Truth.

The following letter has been received :—

Sir,—Probably it will interest you, in view of your quotation from "Truth" *re* life of aero engines, in the current issue of your most valuable and interesting paper, if I mention, to support your statement, an experience of mine.



On August 20th, 1918, I set out on an altitude test on Avro 1808, 110 Le Rhone (No. 13734), and reached the ceiling at 15,000 ft. This engine at that time had done 80-90 hours' flying, and before overhaul had well over 100 hours to its credit. It will be unnecessary to practical minds to point out that engines overhauled, say, every 30-50 hours would have a much longer "life" than the above engine, which most of the time was flown by pupils.

An Aviation Meeting at Barcelona.

An aviation meeting will take place at Barcelona on Oct. 5th next, under the auspices of the Aero Club de Cataluna. The British Chamber of Commerce for Spain has been successful in securing the participation of foreign pilots in the race, which is to take place over a course of about 100 kilometres. The foreign pilots will be "hors concours" so far as the race for Spanish aeroplanes steered by Spanish pilots is concerned. In the case of more than three foreign machines taking part, a special prize will be reserved.

CIVIL FLYING

WITH

THE SOPWITH "GNU" 3-SEATER

COMFORT AND ECONOMY

The Sopwith "GNU" is a Touring and Business Aeroplane of high performance. Passengers and luggage are accommodated in a covered-in cabin.

Pilot is in the open and well-protected.

The WORLD of AERONAUTICS (continued)

A Transatlantic Souvenir.

To-day, Sept. 10th, is the last day on which the stamp souvenir of the Transatlantic flight may be secured. The much-advertised "Hawker" postage-stamp, initialled on the back by the Postmaster-General of Newfoundland, and encased in an album with the autographs of Lord Northcliffe, Capt. Sir John Alcock, Capt. Sir A. Whitten Brown, Mr. H. G. Hawker, Capt. K. Mackenzie Grieve, and Mr. T. Sopwith, is to be sold to the highest bidder; the total sum received will be handed to the Newfoundland Marine Disasters Fund.

The highest bid up to Monday last was £52 10s., which is offered by Mr. H. S. Saunders, of Lloyd's.

An Airship Bed.

Lady Sybil Grant is organising an exhibition to be called "Airships in Peace and War." It is to be opened at Prince's Galleries, Piccadilly, London, on Sept. 15th. It will contain models of airships, pictures and sections of ships. It is announced that the French authorities have sent a splendid exhibit. The profits of the exhibition will be used to subsidise an "Airship Bed" at St. Dunstan's.

Inspired into Song.

Miss Nellie Gibson, the parachutist, wrote recently to the inventor of the "Guardian Angel" parachute:—

"When I had the signal given me to drop from the Handley Page machine I dived without the slightest fear, and before I had the time to appreciate the fact that I had leapt from the 'plane, I felt myself gloriously and comfortably on the balance, just as if I were swinging in a hammock, being at perfect ease in my harness, and during the descent the happiness inspired me into song. I made a safe landing much to the joy of the Indian troops who witnessed the descent."

Whale-hunting with Aeroplanes.

Aeroplanes are being used on the west coast of Vancouver Island for spotting whales. The machines patrol the sea in the same way as did the submarine hunters during the war, and when the whales are spotted the news is wirelessed to the whaling ships.

£1,000 in Prizes.

Prizes to the value of £1,000 are offered by Kodak (Australasia), Ltd., for photographs taken *en route* by competitors in the England to Australia flight.

The first prize is £800, the second £150, and the third £50. Competitors are asked to apply to Kodak, Ltd., Kingsway, London, W.C.2.

A £200,000 Flight.

According to Reuter the cost of Gabriele d'Annunzio's flight from Rome to Tokio is estimated at £200,000. Italian officers and soldiers have already started for the places where d'Annunzio will refurnish himself with fuel on his journey—Asia Minor, India, Siam, Fusan, Korea, Osaka, and Tokio.

£300 Machines.

Inquiries made at the London branch of the United Aircraft Engineering Corporation, at 123, Pall Mall, S.W.1, show that so far only six of the ninety-eight D.H.6 machines bought a few weeks ago from the Aircraft Disposal Board have been sold.

The machines are fitted with 100 h.p. Curtiss ox.5 engines, and it is said that in this country a certain amount of prejudice against this engine seems to exist, though its performances have been good. Some of them have run as many as 250 hours before they have been taken down.

The machines complete have been offered for sale at £300. The D.H.6 machines without engines might be sold for about £130. Both machines and engines are absolutely new, as they have not been in the air since their test flights.

The First Women to Cross the Channel.

It was stated in THE AEROPLANE recently that Lady Muriel Paget, who flew from Paris to London on Aug. 27th, was the first woman-passenger to cross the Channel since the inauguration of the Cross-Channel Air Service under civil aerial transport conditions.

Apparently, this report was erroneous, for on Tuesday, Aug. 26th, Mrs. Sholto Douglas and Miss Gertrude Bacon flew from Cricklewood to Le Bourget on a Handley Page, piloted by Lieut.-Col. Sholto Douglas, M.C., so that these two ladies actually have the distinction of being the first two women-passengers to cross.

Miss Bacon is evidently determined to maintain her record as a pioneer of aviation, as she was one of the most distinguished of women balloonists in the days before flying, and she was actually the first English woman to fly in an aeroplane, her first flight being made at the great Reims Meeting in 1909.

The Sopwith Seaplane fitted with 450 h.p. Cosmos "Jupiter" engine entered for the Schneider Cup Race.

The WORLD of AERONAUTICS (continued)

The Inventor of the Balloon.

In the "Nieuwe Courant" there has been published an article on the first inventor of the balloon, who, it is stated, was not, as is commonly believed, the Frenchman Mongolfier, but the Portuguese Bartholomew Lourenco do Gusmao. Up to a few years ago no one even dreamed of his having ever existed. For two centuries the plan and description of his invention lay buried under the dust of Coimbra University, until Viscount de Faria, Portuguese Consul at Lausanne, brought them to light. Viscount de Faria is the grandson of the viscount of that name, who was Portuguese Minister at the Netherlands Court in 1840-44. A work from his pen, devoted to the first flying man, appeared in 1913, when he visited The Hague as delegate to the Aerial Navigation Conference.

Bartholomew Lourenco do Gusmao, Viscount de Faria tells us, was born in 1685 at Santos, in Brazil, as the son of a physician. He studied law at Coimbra University, and after successfully completing there his curriculum he devoted himself to mathematics and physical science. In the pursuit of these studies he hit upon a process of producing a gas much lighter than air, with which he expected to work wonders. He built a machine, remarkably like the present-day dirigible.

In order to protect himself against his invention being appropriated by others he applied to the King of Portugal for a certificate giving him the exclusive right to his invention before he gave a public demonstration of his balloon. Evidently he was diplomatic enough to represent to the King the very qualities likely to appeal to him. "By means of this machine," he wrote, "any orders can be carried without the enemy being able to prevent it, provisions of all kinds may be sent to beleaguered cities, whilst it would also be very useful to commerce."

The certificate was duly given him in April, 1709, and on Aug. 8th following he gave his public demonstration in the presence of the Court. The spectators were greatly impressed by the spectacle, and called him the "flying man," and his machine the passarola (sparrow)

The inventor met an untimely death in 1724. The Inquisition had got hold of his machine, ordered it to be destroyed, and its inventor to be cast into prison for sorcery. He died in hospital at Toledo.

War Memories.

Capt. Sir John Alcock, K.B.E., D.S.C., has contributed an article to the September number of the "Badminton Magazine." In it he relates some of his experiences during the time he was at Mudros. He writes :—

"Machines were scarce, and we were proud of the fact that a fighting scout was actually built by us at Mudros. And a very good machine it proved, and might have rendered a good account of itself had it not been accidentally destroyed by a following machine landing on top of it in the darkness. Of necessity we took chances in those days—or rather nights. It is easy to land a machine in the daytime, and with plenty of ground a squadron may be assembled; but to take a squadron over water and land them safely in the dark is hazardous, to say the least. It was in these circumstances that our Mudros machine was crashed and ruined. We had no time to grieve, however; accidents were part of the day's work, and we paid but little heed to our loss. There were now plenty of machines, and we were over the enemy all day and every day.

"But my bad day arrived. In the morning I had accounted for two German machines. They were acting as convoy to a camera-carrier. One I put straight to the ground. The other proved more difficult, but I stuck to him till I had him beat, and later his drifting propeller was picked up by our men with the pilot's last message written large on one of its blades. I have just received the following letter from the Bulgarian lady for whom—as it now transpires—this message was intended. Although rescued on this occasion, he seems to have met his fate later :—

" 'Dear Sir,—

' I apologise for having taken the liberty to write to you without being known by you—the liberty to write you and to have your attention just for a moment follow these lines.

' Therefore I must introduce myself to you. I am the young lady to whom the German pilot Muller, that you brought down two years ago, had written his last greetings on the propeller of the wrecked seaplane. Some time ago I received the number of the "Daily Mirror" which contains a picture of the propeller and your photo. I was very curious to know something about you, and Capt. Wildish and Comdr. Greig, who know you very well, told me what a good flier you are, and that just recently you gained the prize in a concourse for a flight over the ocean. I congratulate you for that.

' My friend Muller is a very good pilot, he was one of the best, and I see that he has had a worthy ending, more than that, you must have excelled him to have beaten him down.

' I myself have never been in an aeroplane, and don't know what the sensations may be when one is so high up, but there must be something that makes you risk your life so readily, you really must feel great having conquered the space.

' I began by introducing myself, and I must say something more to let you have a complete picture. I am a Bulgarian and am a graduate of an American college; I lived several years among English and American people, and learned to love your language and literature. Last winter we had great many English people here, and I had the chance to practice the language, and enjoyed it greatly.

' I shall be immensely pleased if you send me a good photograph of yourself, and if you add some snapshots of your seaplane too, I shall enjoy them none the less, and with the picture in the "Daily Mirror" I shall highly treasure. I shall not say how I would wish to possess the famous propeller, but rightly it belongs to you; it is your trophy, for it is you have risked your life.

' Believing you will answer my small request,

' I am, with very best wishes,

' Yours sincerely,

' (sd.) STRAOKO ILIEVNA.

' Varna, Bulgaria,
' 21 Vornishka,
' 1/8/19.' "

The Misunderstood Public.

Apropos the recent announcement that the aerial navigation regulations are being broken constantly by aviators who drop leaflets or take up and land passengers at unlicensed aerodromes, a writer in the "Field" remarks :—

"The Ministry solicits the assistance of the public in detecting offenders, and we are all asked to lay information against anybody whom we find doing these things. As we have said, we fear the Ministry has misjudged the British public. It will secure every assistance in this way when the offence appeals to the ordinary member of the public as deserving punishment, but we are not sanguine that the dropping of leaflets of other than an objectionable character, or the dropping of a passenger or taking up of such, save under decidedly suspicious circumstances, or even the obscuration of registration marks, will move the average man or woman to turn informer.

"These are matters which the police are responsible for in co-related affairs, and very few people somehow, and particularly motorists, are anxious to adopt the rôle of amateur policemen. Low flying will be reported and possibly flying over populous places, if the pilots are foolish to fly low enough to enable their registration marks to be discerned, but who is going to challenge the military or non-military character of an aeroplane, and how is it to be done? Surely it is the duty of the Air Ministry to see that no military or naval machine is sold out of the Service and allowed to retain its distinguishing marks. It is entirely characteristic of a Government Department to put the onus of such responsibility on the shoulders of others."

A Departure.

Among the passengers on board the "Aquitania," which left Southampton on Sept. 6th for America, was Commodore Beaumont, President of the American Aero Club in France.

COMING EVENTS.

AUGUST.

Amsterdam Aircraft Exhibition. (Still open.)

SEPTEMBER.

Saturday, Sept. 20th.—14 Wing, R.A.F., Italy. Dinner at the Imperial Restaurant, Regent Street, London.

Friday, Sept. 26th.—40 Squadron, R.A.F. Dinner at place to be announced.

Sunday, October 5th.—The Aviation Meeting at Barcelona.

Tuesday, October 14th.—The Miss Douglas-Pennant inquiry to be opened at the House of Lords.

May 1st, 1920.—The "Daily Express" £10,000 Prize Competition opens.

DATES TO BE ANNOUNCED LATER.

Hendon-Paris-Hendon Air Race.
Hendon-Manchester-Hendon Air Race.

The "Bristol" Aeroplanes

The Aeroplane on the Ranch

¶ The far-flung boundaries of the ranches of North America, the sheep-runs of Australia or the estancias of Argentina, have rendered personal managerial supervision a matter of great difficulty.

¶ The Aeroplane brings the most distant boundaries of the largest estates within easy reach of the administrative centre.

¶ A prominent American business man has already acquired an aeroplane for the use of his ranch manager.

Excellent in design and in workmanship, and with all the experience and prestige of the

PIONEERS IN BRITISH AIRCRAFT CONSTRUCTION

embodied in their construction, the "BRISTOL" Aeroplanes are capable of sustained, reliable and economic service on the ranch.

NAVAL & MILITARY AERONAUTICS

GREAT BRITAIN.

NAVAL.

The Atlantic Fleet separated into five groups on Sept. 6th and left Portland in the afternoon for an autumn cruise of the East and West coasts. In the morning 11 aeroplanes flew over from Gosport and eight of them discharged dummy torpedoes at the battleships riding at anchor under the screen of smoke-bombs dropped by the other machines. Of three torpedoes discharged at the "Queen Elizabeth" from some 500 yards distance two struck her forward.

MILITARY.

THE CASUALTY LIST.

Reported September 5th.

PREVIOUSLY REPORTED MISSING, NOW REPORTED KILLED.—McLaren, Sec. Lt. F. M., R.F.C.

OFFICIAL COMMUNIQUÉ.

The War Office issued the following communiqué on Sept. 2nd dealing with the operations in North Russia:—

MURMANSK FRONT.—A successful raid has been carried out on Rimkaya, on the east shore of Lake Onega, by Russian troops, assisted by the Lake Flotilla and the R.A.F.

THE LATE BRIG.-GEN. C. F. LEE, C.M.G.

The following notice as to the life of Brig.-Gen. C. F. Lee, C.M.G., is extracted from the "Times" newspaper:—

The death of Brigadier-General Charles Frederick Lee, C.M.G., in an aeroplane accident at Weston-super-Mare, is a serious loss to aviation.

General Lee was only 31 years of age, and was the son of Major W. F. Lee, T.D., J.P. He was educated at Eton, joined the King's Royal Rifles (60th), and was adjutant of the 2nd Battalion when he retired, about two years before the war, and joined the Somerset Yeomanry. He transferred to the Royal Flying Corps at the outbreak of war, and went to France in 1914 as adjutant to Air-Marshal Sir Hugh Trenchard (then a lieutenant-colonel commanding a wing). Afterwards he became brigade-major to Vice-Air-Marshal Sir John Salmond, and in July, 1916, he was appointed R.F.C. Staff Officer, 1st Class, and promoted lieutenant-colonel. When Sir John Salmond went to the War Office as Director-General of Military Aeronautics General Lee (then lieutenant-colonel) was sent to America in command of the British Aviation Mission, where he did very valuable work, and was promoted acting brigadier-general.

He was a first-class pilot, and his wonderful flying in the United States did much to promote the practical *liaison* between the two countries. He had only recently joined the Avro Company, having decided to devote the greater part of his time to the practical development of civil aviation. He was a thorough sportsman, a keen rider to hounds, and polo player, and will be deeply missed by a large circle of friends both in the Service and outside.

* * *

Aeroplanes were sent up to search for armed raiders in three motor-cars who killed a corporal and injured two men of the Shropshire Light Infantry on Sept. 7th at Fermoy, Co. Cork. The party of infantry consisted of 18 men who were about to enter a chapel. Their rifles were taken from them. Pursuit by motor-car was impossible, as the roads had been blocked by trees.

* * *

The Inter-Service Athletic Championships were held at Stamford Bridge on Sept. 4th. The Army won with 42 points. The R.A.F. was second with 37 points.

The following represented and won or obtained places for the R.A.F.:—

100 Yards Race.—(1) Serjt.-Maj. F. Mawby, won by 2 ft. Time, 9 9-10 sec. (3) Serjt.-Maj. L. Kessler.

220 Yards Race.—(1) Serjt.-Maj. Mawby. Time, 22 sec. (3) Serjt.-Maj. Kessler.

440 Yards Race.—(1) Capt. A. P. Mitchell. Time, 50 1-5 sec. (4) Cpl. C. E. Bosberry.

880 Yards Race.—(3) Lt. W. B. H. Shaw, 2 min. 4 sec. (4) A.M. A. E. Morris.

One Mile Race.—(3) Capt. Gibbs, 4 min. 31 4-5 sec.

Three Miles Race.—(2) Serjt. Clibbon, 14 min. 55 4-5 sec.

High Jump.—(1) Lt. F. C. Penny, 5 ft. 9 in. (2) Serjt.-Maj. J. Miller, 5 ft. 8 in.

Putting the Weight (16 lb.).—(3) Lt. P. Fish, 32 ft. 10 in.

120 Yards Hurdles.—(3) Lt. J. F. Fraser. (4) Lt. C. R. Fenton.

Long Jump.—(1) Lt. J. F. Fraser, 21 ft. 11½ in. (3) Capt. Scott, 21 ft. 3 in.

440 Yards Race. Women's Relay (teams of four, each to run 110 yards).—(1) W.R.A.F. team, 55 1-5 sec.

Three-Quarter Mile Relay (teams of four, two to run a furlong and two a quarter-mile).—(1) R.A.F. (Serjt.-Maj. L. Kessler, Serjt.-Maj. F. Mawby, Cpl. C. E. Bosberry, Capt. Mitchell), 2 min. 26 2-5 sec.

AIR FORCE.

According to the "Times," of Sept. 6th, the revised scale of disablement pensions for the higher ranks, which came into force as from September 3rd, is as follows:—

SOLDIERS AND AIRMEN.

For total disablement.	New rates. per week. s.	d.	Previous rates with bonus s.
Warrant Officer, Cl. 1 (Regtl Sgt.-Maj., etc.).	60	0	51
N.C.O., Cl. 1 (Co. Sgt.-Maj., etc.)	53	4	45
N.C.O., Cl. 2 (Co. Q.M.S., etc.)	50	0	42
N.C.O., Cl. 3 (Sgt., etc.)	46	8	39
N.C.O., Cl. 4 (Cpl., etc.)	43	4	36
Allowances for wife and children:—			
For the wife	10	0	No allowance
For the first child (or 10s. if there is no wife)	7	6	1st child 8s.
For the 2nd child (or 7/6 if there is no wife)	6	0	2nd child 6s.
For each subsequent child	6	0	5

The allowance for the man's wife will be granted only where the marriage took place before the receipt of the wound or injury or before the man's removal from duty on account of the disease for which pension was awarded.

The rates (for man, wife, and children) in cases of partial disablement will be proportionately lower.

A widow pensioned under Article 11 of the Royal Warrant will receive while she is under 40 and without children one-half of the pension which might have been awarded to her husband if totally disabled, and when 40 or over, or when she has children, two-thirds of such pension. Children for this purpose are children eligible for allowances under Article 12 of the Royal Warrant.

WIDOW'S ALTERNATIVE PENSION.

The widow's alternative pension (for widows of the above ranks and privates or men of corresponding rank) will be one-half of the husband's pre-war earnings, increased by 60 per cent., subject to a maximum of 50s., while the widow is under 40 and without children. In other circumstances—i.e., where the widow is 40 or over, or has children, it will be two-thirds of the husband's pre-war earnings, similarly increased, subject to a maximum of 66s. 8d. Widows' alternative pensions in issue will be reviewed without application, and so also will cases in which applications received under the 1918 Warrant have been rejected.

The above new rates will continue for at least three years, and thereafter will be subject to readjustment according to the cost of living, but in any case they will not be lowered by more than 20 per cent. or under the previous rates (including bonus).

* * *

Reuter states that British aeroplanes carried out a raid on Kronstadt on Aug. 30th. They were subjected to a heavy bombardment from the batteries at Kronstadt and Krasnaja Gorka. The firing continued the whole evening.

A correspondent of the "Berlingske Tidende" states that the British air raid on Kronstadt on Aug. 30th was an important attack made by 18 big machines. They dropped a great number of bombs, which caused immense damage to the Bolshevik fortress, judging from the many fires observed.

* * *

The following is extracted from an Air Ministry "News Story," dated Sept. 2nd, on the flight of the F.5 Flying Boat from Felixstowe to Scandinavia:—

Exhibition and passenger-carrying flights were carried out at Christiania, Christiansand, and Copenhagen. At Christiania flights were made before their Majesties the King and Queen of Norway. Her Majesty was taken up on two occasions. During the second flight, when the Queen was accompanied by the Crown Prince Olaf, Her Majesty took control of the flying-boat for a short period.

A good impression was created in each of the Scandinavian capital towns visited. It is hoped that valuable results will accrue to the British aircraft industry in opening up what is perhaps the best market in the world for watergoing aircraft. Very few land aerodromes exist in these countries, and the land lying between them is difficult and generally dangerous for alighting. On the other hand, sheltered stretches of water are found everywhere, and there are numerous natural seaplane harbours.

Practically the whole of Norway is navigable by seaplanes making use of the fiords, and in Denmark all the large towns are approachable by water. In Sweden a natural seaplane highway extends right across the country, formed by the two large lakes Vättern and Vänern, the Gotha Canal, and countless small lagoons and lakelets.

The Germans are doing their best to obtain a footing in Denmark, and a short time ago announced aeroplanes and seaplanes for sale at unmistakably "cut" prices. The same policy is being pursued by German companies throughout Scandinavia. Several accidents have occurred with these machines.

The competition of our trade rivals must not be disregarded. It is important to realise that, once a country becomes permeated by machines of one type, a market for spare parts is secured, and the difficulty of effecting a radical change of type increases as time goes on; a golden opportunity will be lost if the British Aircraft Industry does not respond to the great good will which already exists in Scandinavia towards British people and British manufacturers.

From the technical standpoint, the flight of the F.5 gave proof of high efficiency; the hull of the flying-boat was as seaworthy after its month's immersion and exposure as when it left Felixstowe, and the reliability of the Rolls-Royce Eagle 8 type engines was beyond praise. With the wireless telegraphy installation communication was maintained with Dundee during the entire period of the voyage across the North Sea.

The times and distances of the stages flown were as follows :—

		Sea miles	Hrs. flying
July 11th	Felixstowe to Dundee	360	6.0
,, 20th	Dundee to Christiansand	380	7.15
,, 22nd	Christiansand to Christiania	150	2.20
,, 29th	Christiania to Copenhagen	265	4.15
Aug. 3rd	Copenhagen to Stockholm	390	4.30
,, 4th	Stockholm to Goteborg	300	5.0
,, 5th	Goteborg to Esbjerg	245	4.25
,, 6th	Esbjerg to Felixstowe	360	6.55
		2,450	40.40
Demonstration flights		—	5.30
		2,450	46.10

* * *

The Air Ministry announced on Sept. 3rd that all pilots, both Service and civil, who are compelled to effect a forced landing in Holland should report at once by telegraph or telephone to the Military Attaché, The Hague. The Military Attaché has made every arrangement to render rapid help as soon as he has proper details. Pilots should not leave the neighbourhood before they have made a written statement of the extent of the damage done to the private property in the landing; one copy of this must be handed to the owner or local authority, and one copy sent to the Military Attaché.

* * *

The Air Ministry published the following news item on Sept. 5th :—Amongst the various British units employed in fighting Bolsheviks in North Russia is the R.A.F. seaplane flight on the Dwina River. This unit has been continuously engaged since early June in co-operation with the river craft dispatched by the Admiralty to take action against the Bolshevik river gunboats.

The duties of this flight have been arduous. A constant watch has been kept on the enemy vessels, not only by day, but throughout the semi-darkness of the Arctic summer nights; enemy vessels have been effectively bombed and machine-gunned; spotting for the guns of our river flotilla has been directed by wireless, and photographic surveys have been regularly carried out.

The conditions under which this flight lives are somewhat novel. Their home consists of a barge, which moves up or down the river, according to the situation; the difficulties consequent on a moving base have been cheerfully met by all ranks of this unit to whose co-operation a considerable share of the success of the River expedition is due.

* * *

Flying Officer William Eugene Coulson and Aircraftsman James Roach Taylor, of No. 11 Squadron, were killed near Billingborough, Lincoln, on Sept. 5th. Together with another machine they were returning, it is stated, from overseas. The first machine landed safely, but that piloted by F.O. Coulson nose-dived and crashed from a height of about 80 ft. At the inquest on Sept. 6th a verdict of accidental death was returned.

* * *

Renter states that Major Halse, R.A.F., arrived at St. Raphael (France) on Sept. 6th on a "fighting 'plane." He made arrangements with the British Flying School there to continue his flight to Egypt and India.

CZECHO-SLOVAKIA.

The Czecho-Slovakian Military Aviation Service consists of about 100 machines of the Breguet, Salmson, Spad and Farman types. There are roughly the same number of pilots. The service is at present under the command of Commandant Bordage.

* * *

Lieut. Story and Sous-Lieut. Blizenac, of the Czecho-Slovakian Air Service, flying a Bréguet biplane, left Prague on Sept. 2nd at noon and reached Mainz during the afternoon. Leaving Mainz at 9 a.m. on Sept. 5th, they landed at Le Bourget, Paris, at 12.45 p.m.

FRANCE.

Lieut. Bonzac, who is in training for a long-distance flight, made the following circuit in August on a 14-months-old Spad-Herbemont biplane (300 h.p. Hispano-Suiza) : Aug. 8th, Paris-Tours, 124 miles in 1 hr. 30 min.; Tours-Le Poteau, 149 miles in 2 hr. 30 min.; Aug. 11th, Le Poteau-Béziers, 217 miles in 2 hr. 30 min.; Aug. 14th, Béziers-Chalons-sur-Saone, *via* Clermont-Ferrand, 341½ miles in 3 hr. 10 min.; Chalons-sur-Saone-Paris, *via* Nevers, 279 miles in 3 hr.

* * *

On Aug. 25th, at Beauvais, a French sentry posted on guard of a British aeroplane which had made a forced landing during the day saw a man approach the machine. After challenging three times the sentry fired, and the strange visitor ran away. Followed by the sentry (they do these things differently in France) and other soldiers disturbed by the firing, a chase started through the streets of Beauvais. The hunted man was hit apparently by one bullet, for a cry was heard and he "prononça une phrase en allemand." He then succeeded in evading pursuit. The sentry on returning to his neglected post found another stranger by the aeroplane. A second chase followed and again without result. Nothing is known that will throw light on the incident.

* * *

Commandant Vuillemain and Lieut. Dagneau, who recently flew from Paris to Cairo, began their return journey last week. Commandant Vuillemain landed at Constantinople after an uneventful journey on Aug. 27th. Lieut. Dagneau wrecked his machine in landing at Beirout on Aug. 26th and is returning to France by sea.

* * *

Capt. Lafon, who has been awaiting an opportunity to fly again from Paris to Constantinople, has been appointed to represent French military aeronautics at the Amsterdam Exhibition. He left Villacoublay at 11 a.m. on Sept. 4th, flying a S.E.A. biplane. At 12.20 p.m he landed at Brussels after a flight at an average speed of 140 m.p.h.

During the afternoon he continued his flight to Amsterdam, landing there without incident.

* * *

The French Service d'Aviation propose on Sept. 11th next to do honour to the memory of Capt. Guynemer, who was killed in action on Sept. 11th, 1917. The last citation of Guynemer will be read to all aeronautical formations during the day, and the ceremony will be in addition an act of homage to the memory of all those aviators who died for France. A special ceremony, in which flying will be a part, will be carried out at the headquarters of No. 4 Group at Le Bourget. The General Officer Commanding Military Aeronautics will be present.

* * *

It is rumoured in Paris that Capt. René Fonck, the great French aerial fighter, intends to seek election to the Chambre des Députés for a constituency in the Gironde.

GERMANY.

The following is extracted from a telegram from Warsaw, dated Aug. 28th, received by the Polish Press Bureau in London :—

The Germans continue to make attacks on Poland. The "Kurjer Warszawski" reports that on Aug. 27th Sosnovitz, in the Dombrowa coal district of Poland, was attacked three times by German aeroplanes.

An aeroplane flying low over the town at 6.40 a.m. machine-gunned the people in the streets. At 9.35 a.m. the most crowded streets were attacked in the same way. Two persons were seriously wounded and thirty slightly wounded. A third similar attack was made at 7 p.m. Afterwards three German machines appeared. Bombs were dropped at the Polish outposts on the frontier and on the bridge at Szopienice.

* * *

A Berlin message from Reuter, dated Sept. 4th, states that with regard to the recent reported destruction of German airships, the Aerial Department of the Ministry of War stated that the Ministry has had no airships for months past, and therefore they had nothing to say regarding the reported wrecking of Zeppelins. The Navy Office declared that there

NAPIER

THE PROVED BEST

BRITISH BUILT

AERO ENGINES

FIRST—LONDON TO MADRID—NON-STOP

Messrs. D. Napier & Sons Ltd,
14, New Burlington Street,
LONDON, W.

Dear Sirs,

We beg to confirm our wire to you of the 1st inst. as follows "We have completed our non-stop flight from London to Madrid in 7¾ hours due in great part to the perfect running of your engine for which accept our hearty congratulations".

From the moment we opened the throttle at Acton to the time we switched off on landing at Madrid the engine ran perfectly and never caused us a single moment of anxiety. The petrol consumption on this flight was very low, the fuel used being considerably less than one third of the total capacity of our machine.

We cannot speak too highly of your engine on this flight.

Yours faithfully,

W. P. Curtis · Jas Peters

Catalogue gladly sent on application.

D. NAPIER & SON, Ltd.,

14, New Burlington Street, LONDON, W. 1.

Works: ACTON, LONDON, W. 3.

was nothing to add to the statement already published in the Press to the effect that some of the German airships were dismantled during the last weeks of the war. Seven others were destroyed by their crews at that time and soon after the sinking of the warships at Scapa Flow.

The "Tägliche Rundschau" states that the report that the airships had been destroyed by their crews is not correct. There was no wilful destruction of the seven airships. This was not possible, if only for the reason that, in accordance with the armistice terms, all airships and aeroplanes had to be rendered unfit for military use.

ITALY.

On Aug. 22nd Lt. Ancilotto flew a S.V.A. non-stop from Rome to Warsaw with a message from the Italian Premier to the Polish Premier. The average speed made was 118 m.p.h.—T. S. H.

* * *

According to the "Giornale d'Italia," the Italian Government has decided to send to the capitals of the Great Powers military attachés especially competent to deal with aviation questions.

MEXICO.

The Mexican Army Air Service has been gradually growing until it now numbers 500 aviators in various stages of training, while there are 6,000 applications on file. Colonel Alberto Salinos is Chief of the Service.

RUSSIA.

The Bolshevik military report of Sept. 3rd states:—In the inter-lake region, in the direction of Murmansk, we captured an enemy aeroplane which was obliged to land, taking the pilot, an Englishman, prisoner

BOLSHEVIST REPORT, September 7th.

In the inter-lake region (Murmansk Front) in the direction of Petrozavodsk (west coast of Lake Onega) enemy aeroplanes are carrying out systematic flights.

SPAIN.

The Spanish Government is continuing to dispatch large quantities of war material to Morocco, and special attention is being paid to the fourth arm. It is understood that 20 Airco biplanes are on order.

U.S.A.

A squadron of thirteen Curtiss army biplanes, named the "All-American Pathfinders," were due to start on a trans-Continental flight from Mineola (New York) to San Francisco on Aug. 13th. The squadron is under the command of Maj. O. M. Baldinger, and will fly in formation during the whole journey.

The itinerary of the flight embraces fifteen States and covers 4,183 miles. Stops and exhibitions will be made at 171 cities. The flight is being made to educate the people of the country, as well as being part of a recruiting campaign for all branches of the army.

The personnel consists of 22 officers and 80 men. The squadron has been divided into seven distinct sections: (1) headquarters and advance; (2) aerial routes, mapping and landing field; (3) recruiting; (4) flying and field operations; (5) wireless telephone and telegraph; (6) photographic; (7) balloon and airship.

Wireless telephones are fitted on all the machines, and reports of the progress made will be sent to the War Department by wireless.

The balloon and airship section are taking six specially constructed balloons and a "K" type observation balloon. This kite-balloon will be inflated at each stop.

A searchlight and field lighting section from the Engineer Corps also has been attached to the squadron. They are taking a 60 in. 250,000,000 candle-power searchlight, which can be seen by an aeroplane 110 miles away.

* * *

According to a message from the "Daily Mail" New York correspondent, dated Sept. 3rd, an American army aeroplane flying over the Rio Grande was heavily fired upon by Mexicans. The pilot, Capt. Macnabb, was severely wounded in the head. It is not yet known whether the aeroplane was over American or Mexican territory.

* * *

It is stated from Washington that 270 aeroplanes have been shipped to the Panama Canal zone for patrol duty.

R. A. F. FASHIONS.

It is reported that the new uniform for R.A.F. officers will cost £18 18s. Each extra gold ring on the sleeve costs 25s.

The barathea cloth used is much more expensive than the cloth used in the R.A.F. horizon blue uniforms, which cost £12 12s.

The advantages of the new blue cloth are that it is darker, more permanent, and possibly may have better wearing qualities.

METEOROLOGY AND AERIAL NAVIGATION.

According to the official news letter from Washington, an example of the importance of meteorological information and forecasts to aerial navigation is that in connection with the recent visit of the British dirigible, the R.34, to that country. The first call for meteorological information and forecasts was received from the commander of the airship when off Newfoundland, and was by radio through the shore station at Cape Race. Immediately on the receipt of this call, information of the prevailing weather and winds along the American coast north of New York and forecasts of wind and weather conditions were sent twice each day until the airship reached Long Island.

Perhaps the most important information contained in these advices was sent when the airship was flying between Nova Scotia and Cape Cod, encountering head winds and its supply of fuel nearly exhausted. The prediction was to the effect that the wind would change to the north-east within the next 12 hours. Unquestionably this change in wind was most timely, and enabled the airship to reach its destination without the aid of torpedo-boats. During all the time that the R.34 was moored at the flying-field on Long Island advices three times each day concerning the probable wind and weather conditions were supplied to its commander. Its dramatic departure was made on urgent recommendations from the Weather Bureau to the effect that a storm was approaching rapidly from the region of the Great Lakes, that the wind and weather conditions, then favourable for a start homeward, would continue but a few hours longer, and that to remain moored on the flying-field would be at the risk of having the airship torn from its moorings and swept away by winds and squalls that would set in before the expiration of the night.

This bulletin was sent as an urgent message at 9 p.m., and at midnight the R.34 was on her homeward flight under exceptionally favourable winds and weather conditions. It is fortunate that she left when she did, for the following morning the wind was blowing half a gale, rain had set in, and atmospheric conditions were most dangerous for an airship unprotected on a flying-field. In the meantime, the R.34 was miles eastward, flying in good weather and with strong following winds making exceptionally fine speed. That the work of the Weather Bureau in this connection was appreciated is evidenced by the following message received from her meteorological officer *via* radio after her departure: "Many thanks for kindly and efficient manner in which weather information has been supplied. Very grateful."

THE F.5 AT THE ELTA.—General Snyders, late Commander-in-Chief, Royal Nederlands Army, and various Dutch Editors inspecting the boat, Mr. M. H. Volk, of the Gosport Aviation Company, the constructors of the boat, is also shown.

Government Aircraft Competition

An important clause in the £64,000 prize conditions.

"16. Soundness and quality of construction will include—

(a) Fire protection, including use of self-sealing tanks (from the point of view of safety from fire in the event of a crash), fire fighting appliances and accessibility of same."

The only self-sealing tank

in use and approved by H.M. Government is the

AERONAUTICS and The LAW

PERSONIFIED AIRCRAFT.

By "THE LINCOLN IMP."

Human children are registered on birth. Aircraft are to be born on registration. A human being, even before birth, is not without legal recognition. Thus a female murderer with child cannot be hanged before she is delivered, and in practice is, the "Imp" believes, reprieved. It is also criminal to kill an unborn child. Similarly aircraft, even before registration, will have to be accorded some sort of legal recognition. But, speaking quite generally, the law does not recognise as separate and distinct personalities either unborn children or unregistered aircraft. Children begin in law on birth, aircraft on registration.

Unnational Aircraft.

An aircraft which is not entered on the register of any State is not only unborn. It also is "unnational" to coin a phrase to meet the novel facts. It has *no* nationality. Nationality is only to be acquired by the aircraft being entered on the register of some State. An aircraft without a nationality is a trespasser wherever it goes, except over the high seas. Registration by "a contracting State"—*i.e.*, a member of the League of Nations—confers the Nationality of that State. An aircraft of that nationality can claim freedom of innocent passage over the territory of that or any other member of the League of Nations as of right. But registration by non-members of the League confers no such right. Indeed, an aircraft so registered may not even be permitted to fly above the territory of a member, except by a special and temporary authorisation. Should Switzerland join the League and Germany not do so, then for Switzerland to allow aircraft registered in Germany to fly across its borders would be a *casus belli* at the suit of other members of the League. Such aircraft, therefore, have a kind of local legality. Outside the ring fence of the League they are all right. Within it they have no business. The flight of unborn—that is, totally unregistered—aircraft is, however, altogether and everywhere illegal.

Illegitimate Aircraft.

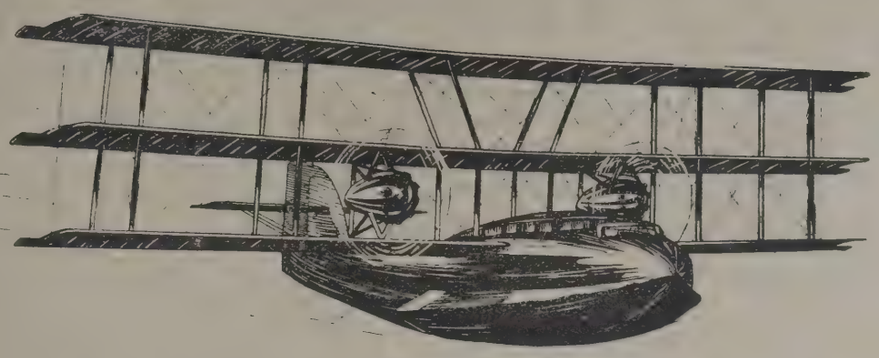
Aircraft are also illegitimate and their flight illegal by reason of parentage or ownership. Parents of children may be of two nationalities, but owners of aircraft may not. An Englishman and a Frenchman may not own the same aircraft. Nor may an English company and a French one. At least they may not be its registered owners. To what extent nomineeship and trusteeship is to be permitted (if at all) is not apparent. If an American and a French-Canadian buy an aeroplane in France, intending to fly it there, and approach the French Registrar to have it registered, he will refuse them. Neither is a French national. If they approach the English Registrar, he will refuse them.

Canada is a "State" for the purposes of the Convention, and a Canadian is not an English "national." If they approach the American Registrar, he should refuse them. The aircraft does not belong "wholly" to American nationals. Suppose the Canadian lies low and the aircraft is accepted as American. Later, desiring to join in a point-to-point trade reserved to Canadian aircraft, the Canadian buys out the American. Now wholly Canadian-owned, the aircraft is struck off the American register. The Canadian then approaches the Canadian Registrar. But he, it seems, must refuse him registration. "An aircraft cannot be validly registered in more than one State." It is illegitimate and useless. (In all probability this is not what was meant by Article 8, but it happens to be what it says.)

Personality.

Let it not be thought that the "Imp" is pressing too far the analogy between aircraft and humans. It is the Convention and Regulations which carry it too far. Aircraft, it seems, are to be completely personified. They are to be persons in law. How in the world—or in law—can a *thing* be a *person*? Quite easily if the law chooses to make it one. Ships have a "character"—British or foreign. Ships are frequently defendants to actions in the Admiralty Court. In Roman Law things were frequently persons. The inheritance of a dead Roman was an aggregation of things—slaves, cattle, money, houses, and land. This aggregation (called a *universitas*) was a person. Before the heir was ascertained, it had rights, could own property, and was subject to liabilities.

Take an illustration. A child is born to one of the female slaves. Whose is it? It cannot belong to its mother (a slave), to the former owner (dead), or to the heir (unascertained). It belongs to the *universitas*. The *universitas* is a person.



In modern English Law, however, a hard and fast line has (up to now) been drawn between persons and things. Land cannot own the houses built upon it. You cannot sue a railway train. The Admiralty action *in rem*, in which the ship itself is the defendant, is the exception that proves the rule. A ship is not a person in law, in spite of having a character. An airship, however, or any other kind of aircraft, really does seem to be personified. The language of the Air Legislation goes far beyond that of the Merchant Shipping Acts.

Marks of Personality.

What are the distinguishing marks of personality? Life is not necessary, for then a corporation could not be a person. Senses are not, for then a blind, deaf and dumb idiot paralytic could not be a person. But to have a name and a nation, to have a will, power to move, power of action; to have knowledge and intention and ability to communicate with others; to have rights and privileges, public and private and even international; to have responsibilities and obligations; to be able to take care or be negligent; to be able to intend wrong and to attempt it; to have needs and the power to suffer and perhaps even to be punished. Surely a being having all these marks of individuality upon it cannot be anything else than a person? Each of these marks an aircraft has expressly attributed to it by the Air Legislation. An aircraft is a person.

Individuality of Aircraft.

If there are 20 souls on board an aircraft, how many persons are there aloft? Not 20, but 21, if the aircraft is a person. The University of Oxford is a corporate person. "If there are a hundred people assembled in a room to work out a decree of the University of Oxford,

TRANSITIONS IN TRANSIT

No. 5. The Merchant Ship of Ancient Rome.

The Trans-Mediterranean sailing vessels of the Romans may be rightly termed the early ancestors of the modern flying boat. Owned by the wealthy Naviculariі Marini Corporations, they carried on profitable trade between the countries of the then known world. Rich spices from the East—precious stones from Africa—tin from Cornwall—oil and bullion—such were the light but valuable cargoes they brought into the Tiber.

But the civilised world has grown since those classic days. Speed has therefore become a factor of greater importance.

Nowadays the aeroplane fills the niche, carrying the light but valuable cargoes from one country to another swiftly—safely. For quick, reliable transit the seaplane is ideal.

The machine illustrated above is the Nieuport Mark Seaplane.

how many persons are there in the room? Not 100, certainly, but 101." (Knogisdoff, "Common Sense in Law.") To any reader of a philosophic turn of mind the "Imp" recommends the study of the theory of corporate personality.

Is a corporation a real person—a fact? Or is it a figment of imagination, a convenient abstraction, a fiction of law? Learned writers argue either way. No one knows for certain. Take it which way you will, facts or fictions, you meet those corporate people every day.

Business men, unlearned in the law, are wont to irritate the ears of lawyers by speaking of "Messrs. Handley Page, Ltd.," and so forth. The solecism lies, of course, in the ignorance that it displays of any corporate personality. Handley Page, Ltd., is not (as Messrs. would imply) the name of a partnership, with Messrs. Handley and Page as partners. It is the name of a single, distinct, legal person or corporation whose name, birthday, fortune, rights, powers, origin, and duration differ in every particular from those of Messrs. Handley and Page or any partnership between them. All this is trite law, but necessary to some readers by way of explanation.

LIMITED LIMITED.

Aircraft can be owned by corporations. Limited Limited, let us suppose, is the name of a company, the chief of whose objects set forth in its memorandum is "to be the registered owner of English aircraft." Its nationality is English. Its registered office is in England. It complies with all the requirements of the English company law. Its chairman and at least two-thirds of its directors are English—but marionettes. The financiers of the concern own series of debentures secured severally and collectively on the fleets of aircraft "owned" by the company. The holders of these debentures are German-Austrian-Turks (or whatever may happen to be your favourite brand of foreigners). They "own" no English aircraft. Oh dear, no! The owners are an English company. If the venture is a success—good for G.A.T. If the venture is a failure, the aircraft misbehave themselves, and their "owner" is wanted, that is nothing to G.A.T., who are now merely innocent creditors of the wicked and insolvent company. Heads they win, tails we lose.

(To be continued.)

"ON GIVING A DOG A BAD NAME."

"An absolute death-trap; spins if you look at it." Of how many types of machine has one heard this said. So far as my recollection goes, the only machine about which it has NOT been said, at any rate, so that I have heard, is—the old Longhorn Maurice Farman Mechanical Cow.

And that brings us to the point in question.

So far as the present writer's experience goes, the Longhorn was the first machine on which he and fellow "Huns" juggled with death.

When we were all thoroughly skilled (according to our own ideas) on this type we were in due course promoted to the Shorthorn (now universially known as the "Rumpety").

Now, as all pilots know, this machine is a trifle lighter, or shall we say, less heavy, on its control than the former, consequently, our "star" Longhorn pilot on his first trip, when he was up about a thousand feet or so, started to do a moderately quick turn. This particular machine is, as we have seen, slightly more sensitive on ailerons than the Longhorn. Consequently, he put on more bank than he intended, and, as luck would have it, got a bad bump at the same time.

The machine side-slipped and started to do a dignified slow spin. He got it out in two hundred feet or so and landed with proper wind up. Everyone, of course, rushed up to him to find out how he liked it. "Ruddy awful thing, spins on a left-hand turn," was his comment.

Now from that day onwards in that particular squadron Shorthorns had a reputation for spinning on a left-hand turn.

About a year later I happened to be at the same aerodrome again and I actually found that the reputation for spinning on left-hand turns still clung to the poor old "Rumpety." When I asked a very young instructor how often he had seen a spin on a left-hand turn, he said he never had, as they were all told to watch the Pitôt carefully on a bank, since a fellow had been killed about a year ago by getting into a flat spin and being unable to get out.

When I suggested that this was probably the story, slightly added to, of our own particular Hun on his first Shorthorn solo, he merely looked at me with a pitying look and was sorry for my stupidity.

Now every machine that has been in the Service since the war has probably made a similar reputation in certain squadrons in a similar manner to the case just related.

At two aerodromes about fifteen miles apart there were two squadrons consisting of "Camels" and S.E.5s, respectively. While a visiting S.E.5 was getting up from the "Camel" aerodrome the engine "konked out," the pilot tried to turn back but side-slipped and crashed.

Now that particular type of crash has probably accounted for more flying fatalities than any other and is common to all types of machine, yet as long as this particular "Camel" squadron exists, they will never cease to regard S.E.5 as an apparatus designed by his Satanic Majesty for the express purpose of killing off perfectly good flying officers.

Shortly after this a "Camel" had the bad luck to crash on the S.E.5's ground through some simple accident. And now 90 per cent. of the pilots of this squadron regard a "Camel" in exactly the same light as do the "Camel" people the S.E.5s.

It is the same all through. Some people cannot find words sufficiently good for the D.H.9, others are unable to express themselves sufficiently forcibly in condemning it.

How, then, is one to counteract this tendency to give a machine a bad name?

First and foremost, in my opinion, it is weak-mindedness on the part of the pilots. They are too ready to believe what they are told: to condemn a machine untried.

The late Captain Hucks, in a paper which he read some time ago, before the Royal Aeronautical Society, drew attention to the fact that there is really very little difference between flying a big bomber or a small fighting scout once one has thoroughly mastered the art of flying.

Everyone agrees that there is a difference of "feel" between riding a small two-stroke motor-cycle and a big twin; the difference is in "feel," pure and simple, not in principle.

So, too, in aeroplanes. A pilot has been flying one type of machine for several hundred hours perhaps. He is put onto a newer and faster type. He is not so comfortable in it and finds it harder to fly, because it does things which his previous machine did not do, and does not do what the old one did.

In nine cases out of ten he will say "it's a ruddy awful machine," "it's dangerous," etc. Someone overhears him and tells someone else. Later on that "someone else" is asked if he knows anything about the machine in question and usually he comes out with the fact that "it's a ruddy awful thing," just as though his opinion were backed by his experience.

And in ninety-nine cases out of a hundred that is how all machines get their bad names.—G. D.

ALLEGED FALSE PRETENCES.

At Bow Street Police Court on Sept. 5th, before Mr. Garrett, Paul Lemay de la Plane, 21, an American citizen, describing himself as a commission broker, of Bedford Place, W.C., was charged on a warrant with obtaining £180 by false pretences from Lieut. James Arthur Eyres, R.A.F.

Mr. H. O. Carter, who prosecuted, said that the case was a sad one, as the prosecutor and the defendant were brother officers. They became friendly in France, and met again in this country at the beginning of July. The defendant, after borrowing £5 from Lieut. Eyres, told him that he had been brought up in the stockbroking business all his life, that he knew all about investments, and that he was working in a stockbroker's office with a salary of £11 a week. The prosecutor parted with various sums, amounting in all to £180, which the defendant told him he was investing in leather with Mr. Reginald Stanley, a hide broker. Ultimately, Lieut. Eyres, a young Canadian officer, made inquiries and found that no investments had been made with Mr. Stanley by the defendant.

Detective-sergeant Rixon stated that the defendant said to him that he had offered the money to Eyres on Sunday, Aug. 31st, but he refused to take it.

A remand was ordered.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

In an article "Concerning Competitions," Captain Sayers criticises the conditions of the Government competitions for commercial aircraft which have recently been published.

Particulars—so far as at present available—drawings, and illustrations of the various competitors for the Schneider Cup Race—which is to be held on the day after this paper goes to press—are given in this number.

Unfortunately no details whatever are available of the Italian entrant.

Of the competitors described it is notable that the regulations for the race have produced—as competitors—five purely racing machines, and only two which can claim to be really sea-going aircraft.

The Phœnix-Cork flying-boat, built by the Phœnix Dynamo Works, is the subject of this week's instalment of Modern British Aeroplanes.

CONCERNING COMPETITIONS.

By Capt. W. H. SAYERS, late R.A.F.

With the advent of Peace the days of aeronautical competitions have once more returned. The Atlantic Flight has been achieved, the Aerial Derby has been run, the Schneider Cup is once more upon us, and the Department of Civil Aeronautics, by way of justifying its existence, has announced that a competition is to be held for commercial machines in the early part of next year.

It is rumoured that the French Government, spurred on by the British example, is to attempt to forestall this country by holding a somewhat similar competition at an even earlier date.

In the present state of the Aeroplane Industry this revival of competitions of one kind or another is a very welcome sign. The Industry cannot live on competitions alone, but such of it as continues to survive is at least stirred by them to the extent of trying to improve its products in the directions demanded by them, and a relatively small expenditure in the shape of prize-money, intelligently awarded, may be the cause, directly or indirectly, of really great advances in the design and use of aircraft.

On the other hand, competitions run on the wrong lines, or under badly considered rules, or for the mere glorification and advertisement of their promoters, be they newspaper proprietors, patent medicine mongers, or mere Government Departments in need of rehabilitation, may, by inducing manufacturers and designers to waste time and money on intrinsically useless types of aircraft, seriously prejudice the future of aerial transport throughout the Empire.

Thus the right ordering of such competitions as are held is a matter of great moment to all who are seriously concerned with the future of aeronautics.

Competitions in so far as the aeroplane is at present concerned, are of two classes.

First and commonest is the type, generally purely sporting in nature, which aims at the exaggeration of some special quality, of which the Transatlantic and the Schneider Cup competitions may be considered as typical.

Such contests are extremely useful, in that they present to the designers and constructors of aircraft some fairly definite problem to be solved. The problem so set is generally not one of direct utilitarian value, and there is no pretence that the machines designed for such a competition and performing well therein are *ipso facto* machines having directly useful functions.

Indirectly such competitions may and often do lead to very considerable improvements in certain quite limited sections of the technique of aeroplane design or operation, which may be and often are of great importance in the process of "improving the breed" of aeroplanes generally.

A record of sustainedly good performances in contests of this type will give to the public an impression that the technical staff of the firm holding that record is both professionally competent and sufficiently broad-minded to vary their designs so as to best meet any required conditions.

No competition of this type is likely to produce evil results. The task set is invariably that of accomplishing, either first or best, some definite performance, and therefore reduces itself in the end to the simplest satisfactory solution of some relatively well-defined problem, and there is little risk that a faulty or biased judgment on the part of those in charge of the contest will obscure the results.

The second class of competition, and a much more dangerous one, is that intended to promote the development of a directly useful type of machine.

If such a competition takes the form of presenting to competitors a definite job which is to be performed, and the prizes are awarded solely upon some definite measure of the results achieved in carrying it out, then the competition may be quite as safe—*i.e.*, as little likely to cause actual harm—as the purely sporting type of competition.

Thus a competition wherein the competitors were required to carry, say, a total load of 500 lb. in a form requiring 50 cubic feet of cargo space, one journey a day, from London to Manchester and back, for fourteen consecutive days, and wherein prizes were awarded for either

the shortest gross time in the air, or the closest adherence to a pre-declared time-table, or for smallest total consumption of fuel and oil, or such-like, would have nothing but a beneficial effect.

But a competition wherein some person or collection of persons, having determined to their own satisfaction that certain qualities of performance are desirable for machines intended for a specific purpose, lay down these performance qualities as essentials to the competing machines and who devise a series of tests and a system of marking on the results of those tests, and which purports thus to discover what machines are essentially suitable for some specific purpose, may produce the most unhappy results.

The competition which has recently been announced by the Air Ministry, which, according to its sponsors, is intended to encourage the development of safe and reliable aeroplanes for commercial purposes, seems to fall definitely into the dangerous class.

This is the more regrettable in that the regulations issued in connection therewith show that a very considerable amount of trouble has been taken by the committee which has drawn them up, and that they have been animated by excellent intentions.

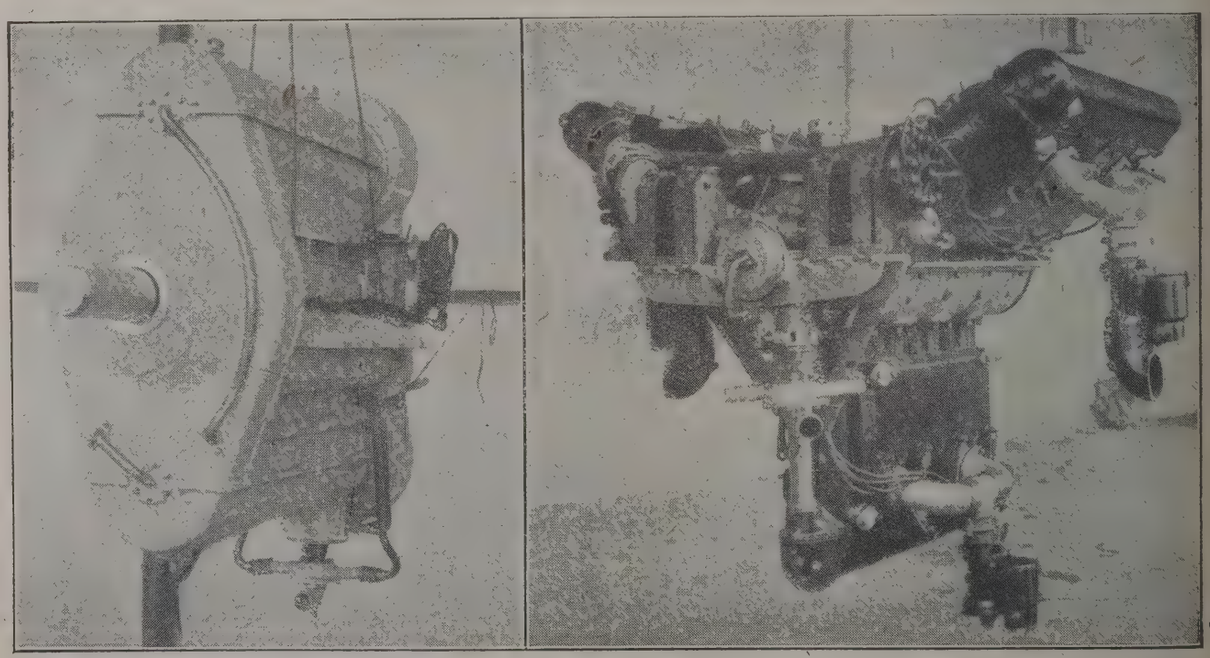
The results unfortunately are nearly sufficient to drive one to forswear for ever either diligence or any but the most evil intent.

A competition run by the Department of Civil Aeronautics, expressly for the purpose of stimulating the design of reliable commercial aircraft, under rules drawn up by a committee which includes accredited representatives of the Aircraft Industry, cannot fail to attract a large amount of attention from all those who may have considered the possibility of using aerial transport in their business.

A very small proportion of such people have any technical knowledge of aeronautics, and they cannot be blamed if they come to the conclusion that the prize-winning machines in such a competition represent the best and most suitable commercial machines that the manufacturers of the Empire can produce.

There is, in fact, no guarantee in the regulations that the prize-winning machines will be of any practical value whatever.

Considering the details of the regulations as they stand, they call for some criticism.



The absurdity of the small class for aeroplanes, limited to one passenger in addition to the pilot, has already been commented upon in The Aeroplane, as has the absence of any consideration of the engine power employed.

The speed ranges called for—from 40 to 100 m.p.h. for small aeroplanes and from 45 to 90 m.p.h. for large ones—are in themselves reasonable. Any attempt to increase the practicable speed range, and in particular to secure a low landing speed, without the sacrifice of a high maximum speed, is laudable, but the value of the condition is prejudiced by two factors—(1) that there is no limit to the engine power employed, (2) as a safety factor an unqualified minimum speed has no definite value. That is to say that a machine which can just support itself at 40 m.p.h., but which cannot be flown below 45 m.p.h. except by a skilled pilot, may be much less safe to land than a machine which falls out of the air at 42 m.p.h., but which is thoroughly controllable right down to that limit.

Similarly the specified climbing speeds are by themselves reasonable, but they are unnecessary for the purpose for which the competition is intended. The climbing requirements for commercial aircraft are limited by two considerations. The first is that the machine should be able to clear obstacles around landing fields.

This is purely a question of gradient of climb, and a machine climbing 400 ft. per min. at 40 m.p.h. will get out of a worse field than will one climbing 500 ft. per min. at 60 m.p.h. Yet the first machine would be disqualified and the second is eligible.

The second consideration is that a machine must be able to reach its cruising height in a reasonable time and without undue delay. This calls for an angle of climb up to cruising height in excess of the machine's best gliding angle. Given this, a machine may climb straight away on its proper course, and yet keep, whilst climbing, within gliding range of the aerodrome. This obviously calls for the maintenance of a sufficient rate of climb up

Two new Italian Aero Engines, built by the V.N.V. firm. On the left a "200/300" h.p. two-stroke, and on the right the 12-cylinder Y of 260 h.p.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

to the cruising height, which for competition work might be put at 5,000 ft. or some such figure, and therefore initial rate of climb alone, without some qualification as to its maintenance at height, is of very little value.

It is possible, though very improbable, that a machine which would climb 500 ft. in its first minute would yet never reach 2,000 ft. In this country such a machine could have only a very limited commercial value.

These performance figures should never have appeared in the rules, or, if they appeared at all, should have been extreme figures merely designed to keep out impracticable and absurd machines.

The landing and getting-off tests, amplified somewhat perhaps, should suffice to keep landing speeds down to safe limits, and a designer who can produce a satisfactory braking mechanism, which will allow of safe landing in a confined space at a high speed, should be allowed to demonstrate the utility and reliability of his design, and not ruled out.

Similarly the practical test of clearing an obstacle, together with the provision that a straight climb was to be made from the aerodrome to some given height, say 2,500 or 3,000 ft., in a wind not exceeding 5 miles per hour, and that on reaching that height the engine was to be entirely cut off before turning, and a return then made to the aerodrome, would secure the essentials of safety without any risk of debarring unforeseen methods of securing it.

This in essence is the nature of the objections which may be taken to the whole of the conditions.

Over and above such objections is the fact that the relative importance of the various features of the designs submitted have to be assessed, according to a scale which is on the one hand arbitrary and on the other hand liable to be influenced by the personal prejudices of a number of so far unknown judges. However well drawn the rules might be, and however competent and unbiased the judges, the result of such a contest will inevitably cause discontent, and will inevitably be open to destructive criticism.

It will in no case afford to the prospective user of aircraft for commercial purposes any of the data which he most desires.

If it really is the intention of the Department of Civil Aeronautics to assist the Aeroplane Industry in an effort to popularise the use of aeroplanes for commercial purposes, it would surely have been well to have considered what are the questions which would be raised by any business man in deciding whether such a use is practicable or not.

Roughly these questions would be three in number. The first would be, "What is to be gained, and how much?" This is fairly simple. The answer to the first part of the question is "Time," and the quantity which may be gained can be defined fairly closely for any given set of conditions.

The second question will be, "What is the reliability of this method of saving time?"—*i.e.*, how often in a year is the aeroplane going to fail to save time, how often is it going to lose its cargo or totally fail to deliver it?

This question cannot be answered with any sort of certainty. Nobody really knows what the reliability of the aeroplane as a carrier is. Nobody has tested it under conditions approaching those of commerce.

And the last and possibly the most important of all is, "How much is it going to cost?" And here again there is no answer.

Let it be imagined that the Department of Civil Aeronautics had suffered from a moment of lucidity and had announced that a competition was to be held under the following conditions:—

(1) Any machine designed and built in the British Empire may be entered. Such machines are to comply with the conditions required for an airworthiness certificate.

(2) The entrant of each machine is to declare the normal useful load capacity of that machine when carrying fuel for 300 miles at a declared normal cruising speed.

(3) Each such machine, loaded to the declared load, shall be submitted to certain defined tests of landing in small fields and getting off therefrom, more or less as those actually laid down in Rule 6 of the actual competition.

Thereafter the machines entered are to be handed over to the competition committee, complete and in running order, and a selling price for each is to be declared and published. Competitors may nominate their own pilots and maintenance staffs, and shall declare the rate of payment of each member of the nominated staff.

Each such competing machine shall then be run by the competition committee upon a regular service consisting of one journey of 250 land miles each day, loaded to its declared load, and timed at its declared cruising speed, for at least 14 consecutive days, though a much longer period would be desirable. During these tests the whole cost of operating should be borne by the committee, to be recovered eventually from the competitors.

At the end of the test the cost per ton-mile of goods actually delivered, including interest on the capital represented by the machine, depreciation based on the actual condition of the machine at the end of the trial, cost of fuel, oil, wages, repairs, and maintenance, should be ascertained.

These should be published, together with full particulars of the actual times taken on each journey and of all mishaps and delays.

With such a test, prizes might be awarded on almost any of a large number of different bases.

For instance, cargoes might be priced at so much per ton per minute. Every minute lost from the schedule time would be charged to the machine losing it, and every lot of cargo not delivered at all would be charged at its price per ton and added to the running costs, and a prize for the lowest cost per ton-mile awarded. This might be extended to cover speed classes—*i.e.*, machines classed as low speed, up to 70 m.p.h. overall average, and high speed, up to 100 m.p.h. overall average.

Or prizes might be awarded merely on reliability and punctuality, or on almost any basis—it would matter little—since the publication of the performance data would supply all the information that anyone needed, and any manufacturing firm that felt confident that its machines would perform well from a commercial standpoint would enter for the sake of the advertisement that they would stand to gain.

As the proposed competition stands now, there are so many conflicting or disconnected features for which marks are to be awarded, and so much is inevitably left to the opinion of the judges, that the winning of a prize therein may mean anything—or nothing.

THE AIRCO EXHIBIT AT THE E.L.T.A.

The British section of the E.L.T.A. exhibition at Amsterdam has been considerably improved since the opening of this successful aeronautical show. The Airco stand has the white Airco 16 machine complete, with the exception of the planes, and it is very attractive in appearance, as most of the metal fittings, including the long exhaust pipes, are nickel-plated.

The cabin is tastefully decorated. The roof is cream colour, the curtains old gold, and the seats black. The sides of the cabin are dull green, purple, and old gold, and two large pillows of green silk are added. A black carpet covers the floor.

The cowling of the machine is buffed aluminium, the front part of the fuselage white, and the rear portion—the section covered with fabric—and the tail unit are natural dope colour. The chassis is dull black.

Excellent postcards with inscriptions in Dutch, and leaflets and pamphlets, also in Dutch, have been prepared.

Twenty Years Ago

these initials stood in East Anglia for reliability, promptness, sound workmanship, and straight dealing.

MANN & Co EGERTON Ltd

NORWICH · LONDON · IPSWICH · BURY ST EDMUNDS

To "Aeroplane" Subscribers.

HOW TO SAVE ONE GUINEA, EIGHT SHILLINGS & NINEPENCE OR SEVEN & SIXPENCE.

The subscription list of the Aeroplane, both at home and abroad, is steadily increasing: an eminently satisfactory movement which we are anxious to encourage.

Of the many books published on the war on the Western Front, none conveys a more realistic impression of the work of a particular arm than FLYING COLOURS by Captain H. M. S. Saundby, M.C., A.F.C., R.A.F., published at **£2 2s.** net (Edition de luxe) and **15/-** net (Popular Edition).

Among the art books published in the last year or two, none can claim to be a more faithful reproduction of the artist's colour scheme and that indefinable thing, atmosphere.

FLYING COLOURS is a permanent memorial of the life of "the pilot in action," as Major-General C. B. Ashmore calls him. It was very costly to produce, and necessarily the price to the public had to be high.

Many would like to possess it who do not feel disposed to put down Two Guineas for the larger edition or Fifteen Shillings for the smaller.

How to meet their views? We make a special offer to any subscriber for one year to the Aeroplane: namely to give him the right to purchase either edition at half price.

All he need do is to send us the accompanying order form with cheque for one year's subscription, plus **£1 1s.** or **7s. 6d.** according to the Edition he wishes to have.

In order to be fair to current yearly subscribers we extend the half-price concession to them also. If a subscriber has paid a quarterly or half-yearly subscription, then to secure the right to participate he should send the balance for the year.

Subscribers who have given their orders through the trade, and not direct to the Aeroplane Office, must sign the form below or a copy thereof, and hand it with the balance on account of the book to their retailer for transmission to the Aeroplane.

If the subscriber already has a copy of FLYING COLOURS, and would wish to take advantage of this offer, then he may secure McCudden's "Five Years in the R.F.C." **(7s. 6d.)**; Richthofen's "Red Air Fighter" **(3s. 6d.)**, and Gill's "The Aerial Arm" **(6s. 6d.)** at half price, *i.e.* **8s. 9d.** the three, plus the year's subscription to the Aeroplane.

Subscribers who take advantage of this offer will have no reason to complain of the cost of their books.

ORDER FORM.

To THE "AEROPLANE,"
61, Carey Street, W.C.2.

Please send me the "Aeroplane" or one year post free **(30/- inland; 35/- abroad** and one copy of the { Edition de luxe / Popular Edition } of Flying Colours at half price { **£1 1s. 0d.** / **7s. 6d.** } for which I enclose remittance value **£ s. d.**

THE SCHNEIDER CUP COMPETITORS.

THE SOPWITH MACHINE.

The Sopwith Schneider Cup racer shows a number of interesting and more or less typically Sopwith characteristics.

The very small span, relatively large chord, and the small gap are very reminiscent of the original Sopwith Schneider Cup machine of 1914. If memory serves one right, the chord and gap, 5 ft. 1½ in. and 4 ft. 6 in. respectively, were the same in the 1914 model as in that of to-day. The span of the new machine is some 3 ft. less, and there is a small backward stagger.

The floats and chassis are not unlike those of the original, though the section of the front part of the floats, with an outwardly flaring bottom—a sort of "Vee" bottom halved—is new to this firm.

The main floats have also been extended aft and faired off considerably and a tail float dispensed with. The big 450-h.p. radial engine has naturally called for a big bull-nosed body—even more bull-nosed than the original—and the body has been faired off to a rounded section instead of having been left square. The tail fin and tail plane are likewise faired into the body with large radii, and altogether the machine has been carefully studied with a view to producing the minimum of head resistance.

The Sopwith at Cowes.

With a power loading of slightly under 5 lb. per h.p. and with the Sopwith firm's unrivalled experience in the production of small fast machines, this machine should prove to be one of the fastest aeroplanes yet built, and Messrs. Sopwith should stand an excellent chance of winning the Cup for the second time.

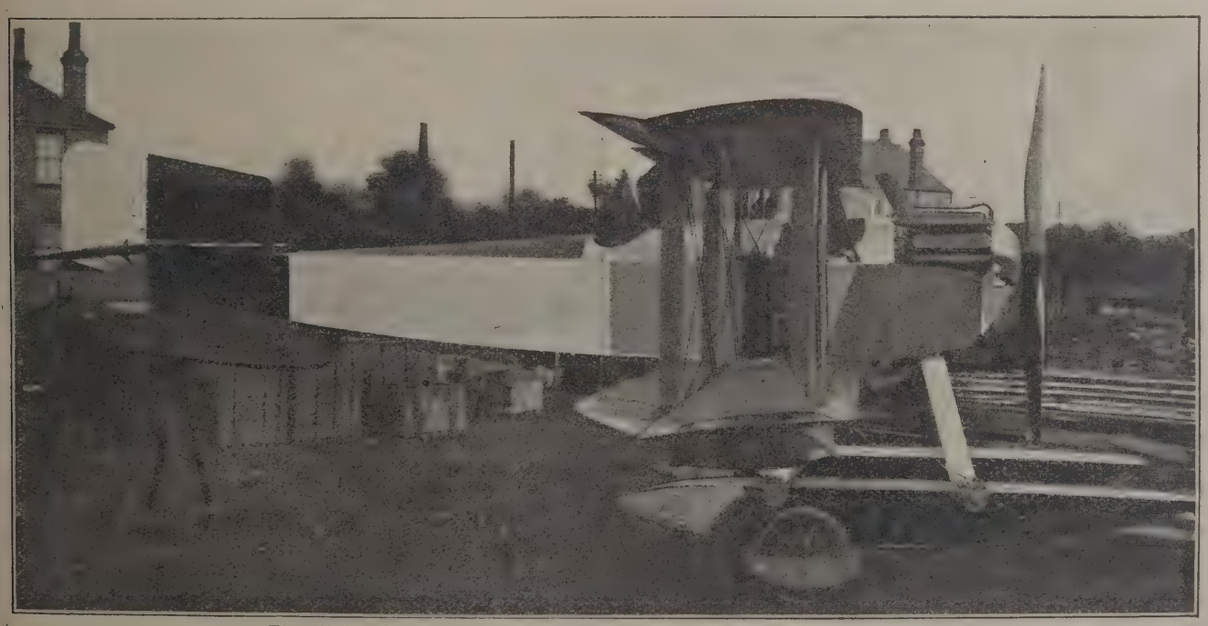
SPECIFICATION.

Span	24 ft.
Chord	5 ft. 1½ in.
Gap	4 ft. 6 in.
Total area of wings	210 sq. ft.
Length (propeller boss to tail)	18 ft.
Length (overall)	20 ft.
Stagger	2½ in. negative
Weight (empty)	1,600 lb.
Weight (loaded)	2,200 lb.
Engine	Cosmos Jupiter 450 h.p.

THE SUPERMARINE BOAT.

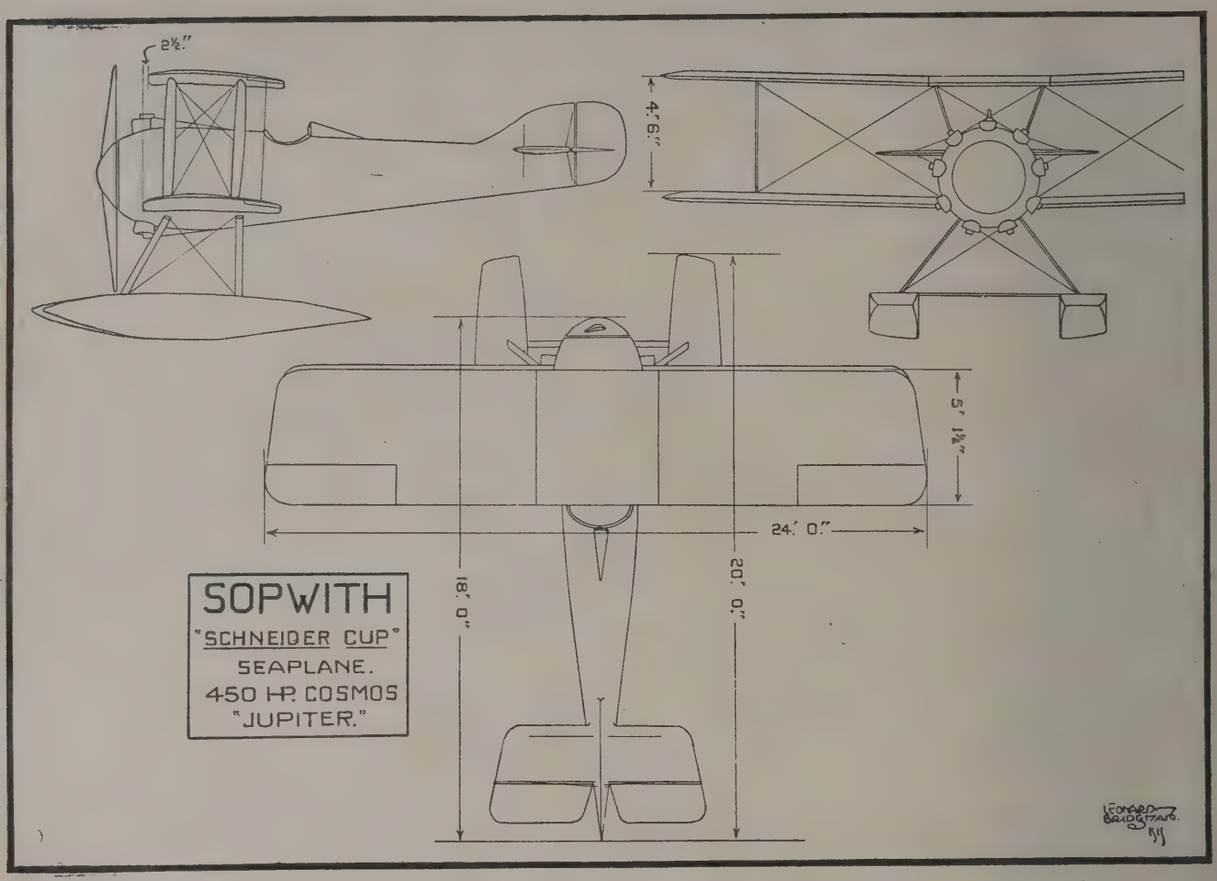
The Supermarine flying boat is a considerably larger machine than any of the other competitors, except the Fairey and possibly the Savoia, of which there are at present no particulars available. It is in fact more or less a standard type of flying boat, designed with an eye to real seaworthiness, and fitted with an engine large enough to give it a really high speed.

The boat hull is more or less on similar lines to the well-known Supermarine two-seater and "Baby" types—in that it is a circular, or nearly circular, section streamline body, boat built and doubly diagonal-planked.

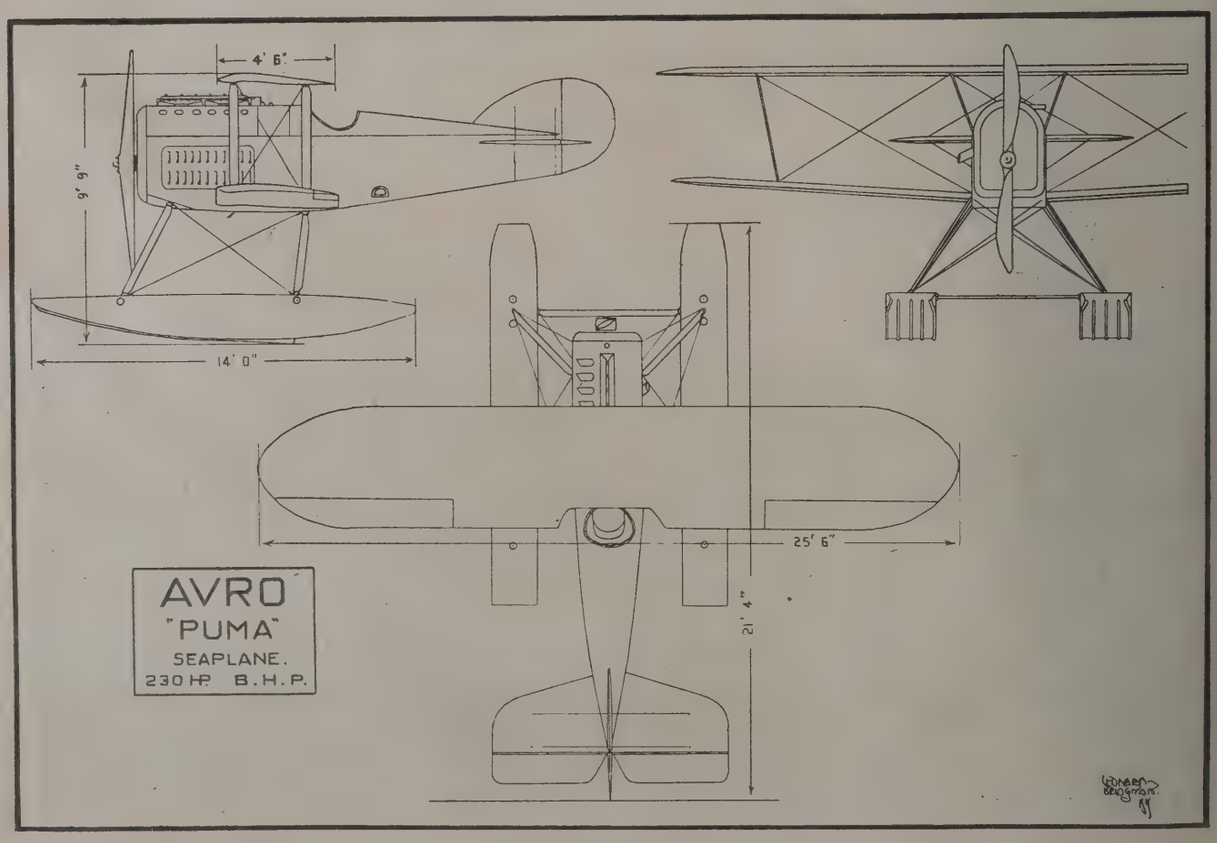


The Supermarine Boat.

It differs from the older Supermarine types in two particulars. Firstly, the fins, which are built out from the main hull to provide planing surface, are concave on their upper sides, and run into the main hull tangentially, instead of being flat and meeting the hull at a sharp angle. This renders the whole fin considerably more flexible and reduces the sea stresses on the whole hull structure.



Secondly, instead of the fins washing out gradually into the hull lines forward the fins are kept wide to well forward and are then brought in sharply to the bows, which are made to assume a sharp "ram" or beak shape instead of being rounded or rather blunt in form. This arrangement, which can be seen in the rather poor illustration—the only one so far available—will very considerably reduce the amount of water coming over the bows when "taxying" in rough water, and gives to the hull a distinctive appearance.



The engine—a 450-h.p. Napier—is carried from the hull on two ash bearers supported on steel tube struts from the root spars of the lower wing, with its crankshaft centre line somewhat higher than halfway up the interplane gap. Ahead of the engine a radiator of oval end elevation forms the forward end of an oval cowl in which the power plant is enclosed.

From the base of the engine struts two pairs of out-

BATH AIRCRAFT LTD.

Manufacturers of Planes, Propellors, Struts, Fuselages, etc.

Highest possible quality guaranteed.

FLIGHT WORKS, LOWER BRISTOL ROAD. BATH.

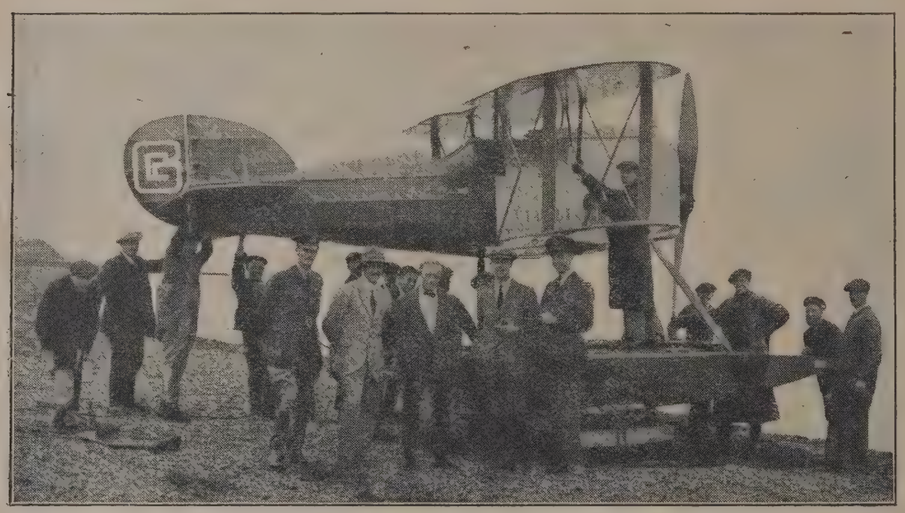
wardly raking struts support the rather wide upper centre section. To this and to the lower wing roof spars are attached the outer section wings. Both upper and lower outer sections are of approximately equal size, and thus—the upper centre section being very considerably wider than the wing root spars—the upper wing has a considerable overhang

The single pair of interplane struts on each side slope outwards, practically parallel to the centre section struts.

The upper wing is fitted with large balanced ailerons.

The tail unit consists of a large fixed fin mounted above the hull. The fixed tail plane—of the inverted wing section type—is carried on the fin structure well above the hull and slightly lower than the thrust line of the airscrew and is braced to the hull with faired steel tube struts. The elevators, of ample size, are balanced, as is the rudder.

The latter is of very high aspect ratio, and is carried right down to the base of the hull stern post, and is at its lower end reinforced to act as a water rudder.



Although the machine is to be run in what is essentially a speed race and will have to compete with machines which are racers pure and simple, it will be completely equipped with a bilge pump, with branch suction pipes to each hull compartment, anchor, sea anchor, mooring ropes, etc.

The following table gives—approximately only—the chief dimensions of the machine. The makers state that the design is under consideration by the R.A.F. as a type of service seaplane and that they therefore do not desire that any full specification should be published at the moment.

The Fairey with the small wings at Cowes.

Gap	4 ft. 3 in.
Height	9 ft. 9 in.
Length (overall)	21 ft. 4 in.
Total area of main planes	200 sq. ft.
Area of tail plane	20 sq. ft.
Area of elevators	8 sq. ft.
Area of fin	4 sq. ft.
Area of rudder	5¼ sq. ft.
Total area of ailerons (4)	22 ft.
Span of tail plane	9 ft. 6 in.
Length of floats	14 ft.
Engine	240 h.p. Siddeley "Puma."

The Avro Schneider Cup Machine.

SPECIFICATION.

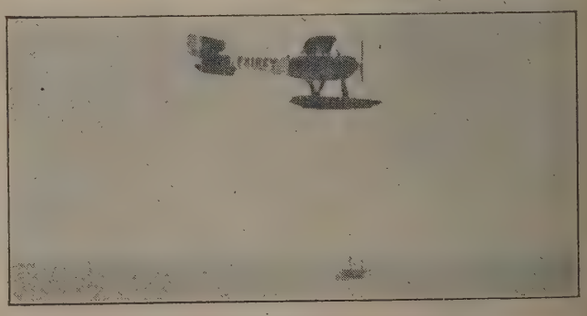
Span	Top wing 35 ft., bottom 29 ft.
Length (overall)	27 ft.
Total wing surface	360 sq. ft.
Total weight (loaded)	2,900 lb.
Loading	8 lb. per sq. ft —6.5 lb. per h.p

THE AVRO MACHINE.

A general description of the Avro entry to be flown by Capt. Hammersley appeared in this paper on Aug. 27th. This it is now possible to supplement with the following specification, and with a scale drawing and photograph. Unfortunately, owing to the untidy state of Southampton Water, and a consequent disagreement between the Avro and some floating débris which put one float out of commission, it is impossible to comment upon its appearance in the air. However, Capt. Hammersley reports that the machine handles excellently, and is up to expectations in the way of speed.

SPECIFICATION.

Span	25 ft. 6 in.
Chord	4 ft. 6 in.



THE FAIREY SEAPLANE.

As has already been stated, the Fairey entry is a modified type 3 seaplane—fitted with the standard floats and chassis, fuselage and centre section, and with a 450-h.p. Napier engine.

Instead of the standard nose radiator two projecting sections of radiator are carried, one on each side of the fuselage, and the front of the fuselage is streamlined off by the engine cowling.

Two sets of wings have been built for the trials, one—more or less of the same type as those of the standard type 3c—with two rows of interplane struts a side. One photograph is given of the machine in this state. With these wings a very low landing speed is possible and the machine with its sturdy floats and undercarriage should be capable of getting off and landing in any sea.

The second set is of 28 ft. span with only a single row of struts. With these the landing speed is still quite moderate, and the top speed is very considerably raised, and unless the conditions at Bournemouth on the day of the race are abnormally bad the machine will probably fly with the latter set.

The Fairey alighting at Cowes.

THE NIEUPORT ENTRIES.

Two Nieuports have been entered for the competition.

Both machines are identical, except in regard to the floats. One machine is fitted with two short double stepped floats, fitted with "ears" at the bows, of exactly the same general type as the floats fitted to the pre-war Nieuport sea monoplanes, together with a tail float.

The second machine is fitted with long single step floats of streamlined elevation, and with no tail float. The two float arrangements are indicated on the attached General Arrangement drawing.

In so far as the machines themselves are concerned they are generally of the Nieuport 29 type upon which Lieut. Casale has put up both speed and height records recently in France. They are single bay biplanes, of equal top and bottom chord, slightly staggered forward and with a flat lower plane and a dihedral on the upper wing. The fuselage is of rounded section throughout, with the Hispano-Suiza engine entirely enclosed within the fuselage except for the valve gear casings which protrude on either side.

The radiators are of a form not hitherto familiar in this country. They are of more or less cylindrical or rather annular form, and the radiators are fitted to each machine below and entirely outside the fuselage. It is understood that this type of radiator is giving excellent results in France—particularly on high-speed machines.

At the rear end of the fuselage fixed fins, both above and below the body, and a fixed tail plane are carried followed by a balanced rudder and balanced elevators.

The tail float of the machine fitted therewith is of streamline form and of circular section, and is carried on a completely faired-in structure—whether of struts or in the form of a plank strut is not certainly known—which forms in effect an extension of the lower fin.

Altogether the two Nieuports have a very clean look, and as the land machines of similar general type are credited with an achieved speed of 265 km.p.h. (164 m.p.h.) there is little doubt that the speed of the seaplanes will not fall much below 150 m.p.h.

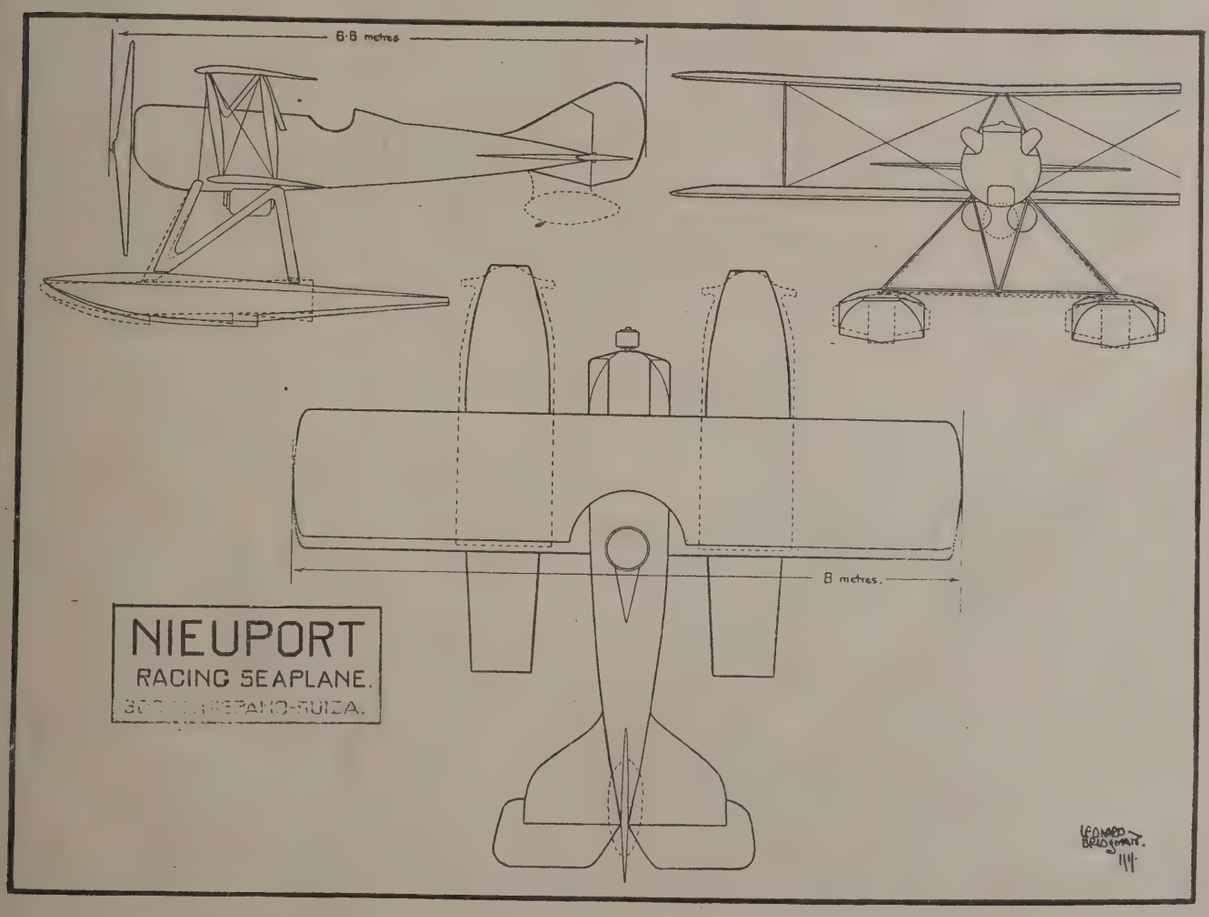
SPECIFICATION.

Span	8 metres
Total surface	22 sq. metres.
Length (overall)	7 m. 30
Engine	Hispano-Suiza—300 h.p.
Estimated speed	250 km.p.h. (155 m.p.h.)

The above information is due to the Royal Aero Club. According to a well-informed correspondent the Nieuport Co. have three machines, only one of which answers to the specification given, the other two having 27 and 30 sq. metres of surface, the third machine being held in reserve.

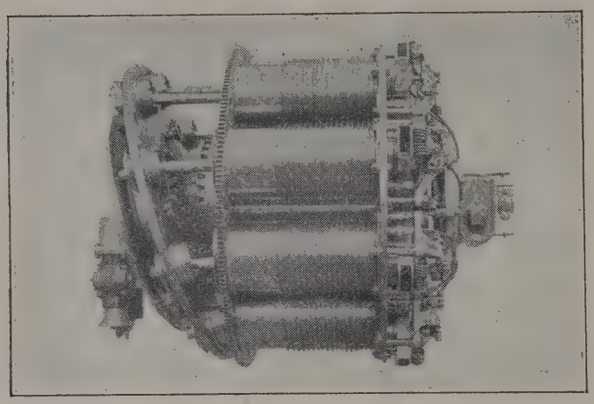
THE SPAD.

The machine, built by the S.P.A.D. for the race, is said to be a modified Spad-Herbémont type 20 machine, with a considerably reduced surface. No illustrations of the machine are to hand at the time of writing, but the specification attached is believed to be accurate, and gives the main dimensions.



The original type 20 Spad-Herbémont machine which has been illustrated in these pages, was a small single-seater biplane, with equal top and bottom wings, and with little or no stagger, and a single interplane strut on each side—this strut being very deep in section fore and aft, and extended in this dimension at each end to carry both front and rear spar on each plane, and it may be presumed that the seaplane will retain these characteristics.

This machine is fitted with twin streamline floats of monocoque construction, which have no steps, but are fitted with rectangular metal hydrovanes to act as planeing surfaces.



It is stated that a reserve Spad is to be held in readiness, and that Lieut. De Romanet is to act as reserve pilot—Lieut. Sadi-Lecointe being the firm's "first string."

SPECIFICATION.

Span	8 m. 690
Total wing surface	26 sq. metres
Length overall	8 m. 100
Engine	Hispano-Suiza—300 h.p.
Weight (empty)	850 kg.
Load (pilot)	85 kg.
Load (fuel)	165 kg.
Weight (full load)	1,100 kg.

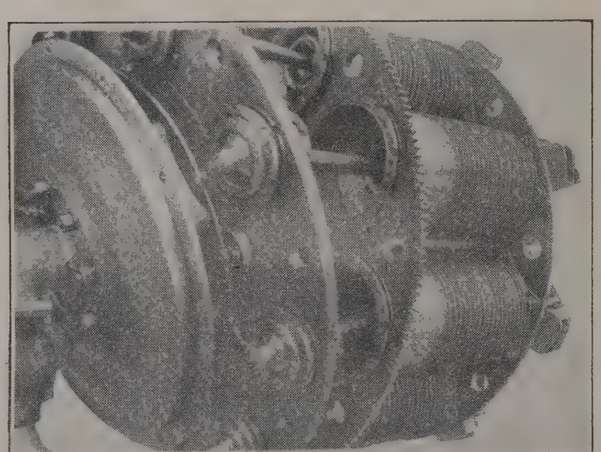
AN ORIGINAL ITALIAN ROTARY.

Side View of the Perfetti-Dolara 300 h.p. rotary engine.

The Perfetti-Dolara rotary 9-cyl. 300-450 h.p. air-cooled engine, exhibited at the Taliedo Show, has been found unexpectedly efficient, so Signor Dolara tells me. So satisfactory have the novel and original features of the patent proved, that with slight changes in the valve distribution, and a second magneto, 450 h.p., will be obtainable from the same sized engine at practically the same weight.

The outstanding novelty of the design is its connecting rods and the transmission of their push in the motor itself. Big ends and crankshaft, in the ordinary sense of the expression, do not exist! Also, the whole engine is a lathe job.

A great part of the gain in efficiency is supposed to be due to the absence of all side-thrust by the pistons against the cylinder walls, the piston-rods being always at right angles to the gudgeon-pins with a barely perceptible sideways movement in the ball-socket joints where the big ends ought to be.



Without removing the engine from its bed the whole thing can be dismounted and the pistons taken out for inspection with the greatest ease.

On the new model 450 h.p. a patent method of fixing the motor to its bed is provided, as is also a direct-driven propeller bearing. In the engine illustrated there is the toothed ring attached to the cylinder "holding-down flanges" (so to call them) for the geared-down shaft-driven airscrew or screws.

The following data show the extraordinary ratio of weight to power, etc.:—Bore 130, stroke 176, cylinder sweep out 21 litres, 1,500 revs. per min., 300 to 450 h.p., weight 280 kilos. or 300, with two magnetos. The engine looks about the size of a 90-Gnôme, and is a wonderful mixture of standard practice with startling originality. It would appear to combine the advantages of a rotary with the non-troubling nature and accessibility of a car type.

Presumably, the engine with airscrew bearing is for a propeller-driven 'bus, as the cylinder heads should face the air-blast one imagines, though the absence of side-thrust in the cylinders will cause them to run cooler than might be thought.

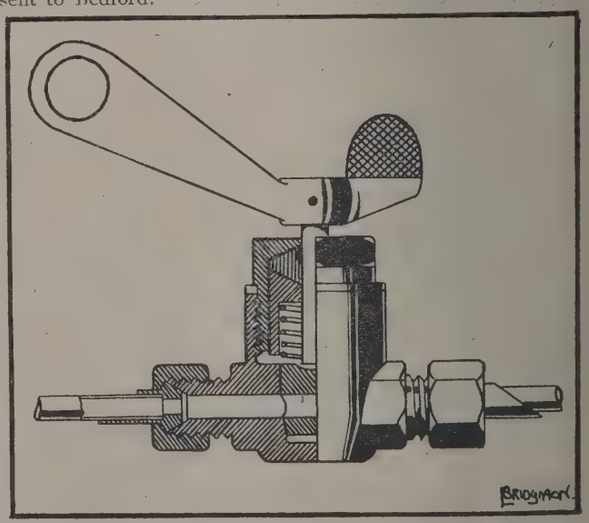
The inventors will be glad, after three years of testing, to find a firm willing to build the engine in series, which should come out singularly economical, being so largely a lathe job. The balancing is said to be A1.—T. S. H.

View showing the skewed disc which takes the place of a crank and the toothed ring for the drive in the Perfetti-Dolara Engine.

View showing Valve Gear and Magnetos of the Perfetti-Dolara Engine.

THE BIRMINGHAM FAIR.

A British Industries Fair is being held at Birmingham from Feb. 23rd to March 5th, 1920. The Fair will be arranged on the Leipzig model with exhibits in every available building. Exhibitors sending in their applications at the last minute may be unable to be grouped in proximity with other firms in the same trade. They are, therefore, requested to send in their applications to the Chamber of Commerce, Birmingham, as early as possible. The grouping is already mapped out, and allotment is steadily proceeding.



This Fair is run in conjunction with similar exhibitions to be held concurrently in London and Glasgow, but Birmingham alone has a section for aeronautical accessories.

AN IMPROVED FORM OF PETROL COCK.

The Aviation Department of Messrs. Vickers, Ltd., have designed and brought out a new form of petrol cock which is made so as to eliminate any form of leakage. As can be seen from the sketch a small helical spring, by exerting uniform pressure in the plug and a packing-ring which is free to slide on the gland tend to make the plug work smoothly, and do away with the necessity of grease, which, through the action of petrol, is dissolved, thereby causing the tap to seize and score, with the result that leakage follows as a matter of course. The Vickers cock, which has been tested officially, can be supplied in sizes suitable for pipes ranging from ⅛-in. to 1-in. bore, with any type of connection, and can also be made for special purposes with three or more branches.

A REDUCTION OF STAFF.

Between 500 and 600 employees at Messrs Armstrong, Whitworth and Company's Aircraft Works at Barlow, Selby (Yorks), were paid off on Aug. 29th owing to the cancellation of airship contracts. According to the "Daily Mail" of Aug. 30th, airship gondolas fitted with engines have been sent to Bedford.

Special Missions of the Air.

By JACQUES MORTANE.

A novelty among War Books.

During the war mention of Special Missions was forbidden.

To tell anything about them would convey valuable and even vital information to the enemy.

What was a special mission?

An "ingenious but most perilous sport," says Jacques Mortane.

It consisted in the landing by aeroplane of spies behind the enemy lines.

The adventures were of the most thrilling description, and the heroes of them went unrecognised by the man in the street.

Extract from Chapter I.

"The 'ace' of the special mission was generally a man celebrated in other branches of aviation, but these men were not always recognised according to their deserts during the war. They were only known to the commanders, and sometimes—in the case of popular heroes—they were traduced by the crowd, which grew indignant at hearing nothing of its peacetime idols."

In the thirteen Chapters of this book the author, writing from authentic records, describes this phase of secret service and shows how the enemy was outwitted and outplayed, albeit often at heavy cost in precious lives.

MODERN BRITISH AEROPLANES.

XII.—The Phoenix Dynamo Co., Ltd.

Three-quarter Stern View of the Phœnix-Cork Flying-boat.

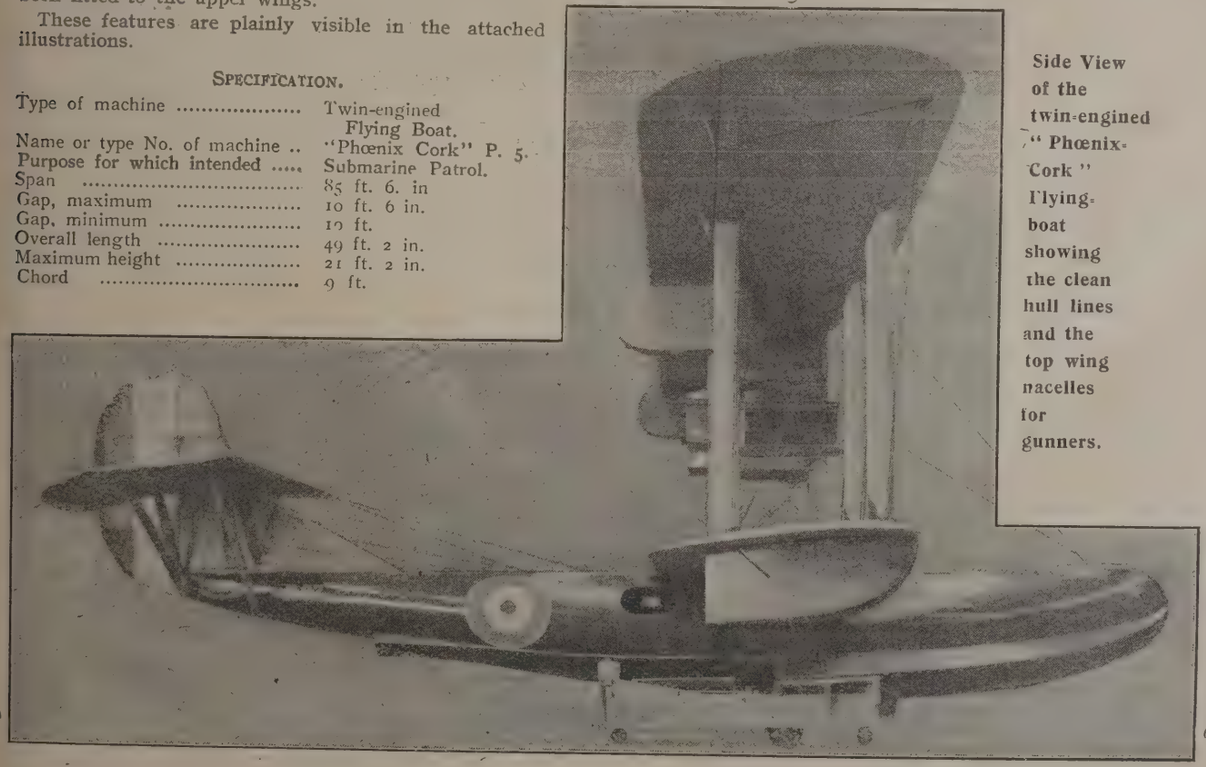
The Phœnix Dynamo Co., of Bradford, were, before the war, amongst the best-known of the British electrical manufacturing firms.

With the advent of war their activities were diverted in some part to the manufacture of aircraft, in which they were eminently successful, under the direction of Mr. E. Pybus.

After the production of very successful versions of other designers' products, the firm secured the services of Mr. W. O. Manning (then Lieut.-Comdr., R.N.V.R.), and have devoted themselves to the design of large boat seaplanes.

The firm has recently amalgamated with Dick, Kerr and Co., Ltd., and has become the aviation branch of the English Electrical Co., Ltd.

THE PHŒNIX-CORK FLYING BOAT.



This, so far, the only product of the firm's own design, which it is permissible to describe, is a large twin-engine boat designed for sea patrol and anti-submarine work.

In general lay-out it resembles most of the successful machines of the boat type designed for this purpose, but it is notable for the extremely clean design of hull, which is circular or oval section streamline, boat-built, and mahogany planked, and for the gunners' nacelles, which have been fitted to the upper wings.

These features are plainly visible in the attached illustrations.

SPECIFICATION.

Type of machine	Twin-engined Flying Boat.
Name or type No. of machine	"Phœnix Cork" P. 5.
Purpose for which intended	Submarine Patrol.
Span	85 ft. 6. in
Gap, maximum	10 ft. 6 in.
Gap, minimum	10 ft.
Overall length	49 ft. 2 in.
Maximum height	21 ft. 2 in.
Chord	9 ft.
Total surface of wings	1,306 sq. ft.
Span of tail	25 ft.
Total area of tail	200 sq. ft.
Area of elevators	58 sq. ft.
Area of rudder	42 sq. ft.
Area of fin	31 sq. ft.
Area of each aileron and total area	42.75 each; 85.5.
Maximum cross section of body	27.75 sq. ft.
Horizontal area of body	202.5 sq. ft.
Vertical area of body	208 sq. ft.
Engine type and h.p.	"Eagle" Rolls-Royce; two 360 h.p.
Airscrew, diam., pitch and revs.	10 dia., 10 pitch, 1,080 r.p.m
Weight of machine empty	7,000 lbs.
Load per sq. ft.	8.85 lbs.
Weight per h.p.	16.1 lbs.
Tank capacity in hours	8 at full speed.
Tank capacity in gallons	360 gallons.

Side View of the twin-engined "Phœnix-Cork" Flying-boat showing the clean hull lines and the top wing nacelles for gunners.

Performance—
Speed low down ..... 106 m.p.h.
Speed at 10,000 feet ..... 94 m.p.h.
Landing speed ..... 52 m.p.h.
Climb—
To 5,000 feet ..... 10 minutes.
To 10,000 feet ..... 30 minutes.
Disposable load apart from fuel 2,000 lbs.
Total weight of machine loaded 11,600 lbs.

Armament: 5 Lewis guns and 4—230 lbs. or 2—520 lbs. bombs.
Crew, 5—Pilot, observer, wireless operator, engineer, and gunner.

THE DEATH OF MR. J. R. NISBET.

The death occurred suddenly from heart failure on Sunday, August 17th, of Mr. James R. Nisbet, who had been a managing director from the beginning of the business of Bowden Wire, Ltd., and its associated companies in France, Germany and elsewhere.

Mr. Nisbet was intimately concerned in the formation of the original Bowden Wire Syndicate, Ltd., to acquire the patents in the method of power transmission by means of a flexible wire invented by the late Mr. E. M. Bowden, and had taken a very close and personal interest in its developments. For some years past he had been the sole managing director of the parent concern and he took a very deep interest in all the details of the business, both manufacturing and commercial, and devoting himself untiringly and unceasingly to its success. Early this year, although far from well, he paid a visit to the United States in its interests.

Mr. Nisbet, who was in his fifty-eighth year, was also head of Hay, Nisbet and Co., Ltd., printers and publishers, of Glasgow London. In addition he devoted a large amount of his time to the legislative side of the sport and pastime of automobilism.

He was one of the earliest members of the Royal Automobile Club and of the Scottish Automobile Club and served on the committee of both. He was a vice-president and chairman of the Auto Cycle Union. He was also a vice-president of the Cycle and Motor Cycle Manufacturers' and Traders' Union and took an active part in its councils.

AEROPLANES FOR SALE.

The Aircraft Disposal Department is inviting inquiries for all types of aeroplanes and engines. They have a limited number of D.H.6 machines, fitted with 90-h.p. R.A.F. and 80-h.p. Renault engines, for sale.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

COMMERCE AND ECONOMY.

By "MEDWAY."

The editorial opinion of THE AEROPLANE as regards the economy stunt when applied to airships has already been expressed. Consequently, though I am privileged to differ with the editorial view as much as I like, I find in this case that the greater part of what I had intended to write has been anticipated.

Up to the present the only industry that really appears to have been effectively nationalised is the "stunt" industry. The Government is in effect the board of directors of a stunt factory, with Mr. Lloyd George as the managing director and principal inventor or adaptor. From the very beginning of the War we have been systematically doped with one stunt after another. Starting with "business as usual," we passed through the period of "push and go" to inquire what "daddy did in the Great War," and so on, until at the present moment, with the able assistance of certain sections of the daily Press, we have reached the Economy stunt. This, having been freely advertised in advance, has now been taken up by the government factory, which anticipates a heavy demand. The only trouble is that, in the hurry of the moment, the board of directors has completely lost sight of the real meaning and virtue of the word and quality of which it is talking so glibly.

SO-CALLED ECONOMY.

Before the war we had plenty of samples of economy, so called. For the time being we refused to spend money on the development of aeroplanes or airships. The result was a subsequent expenditure under each heading vastly greater and vastly less efficient than it need have been. Only a few days ago Mr. Lloyd George made it clear that he did not consider that all wars were over for good and all. This was when he was discussing tests of what constitutes a key industry. Let us take his four tests and consider whether the Airship Manufacturing Industry does or does not conform to them.

Test No. 1. Whether the industry was revealed to be essential for war or the maintenance of the country during war.

Comment on this point would be altogether superfluous.

Test No. 2. Whether during the War it was discovered that the industry had been so neglected that there was an inadequate supply of goods produced in the industry for the purpose of equipping ourselves for the essential task of war.

Test No. 3. Whether it was found necessary for the Government to take special steps to promote and foster that industry during the War.

Test No. 4. Whether, if that special Government support were withdrawn, the industry could maintain itself at the level of production which War has shown to be essential to the national life.

A SELF-EVIDENT TRUTH.

I had intended to comment on these four tests one by one, but when it comes to the point I find myself up against the difficulty that one cannot very well set out to prove a self-evident truth. The Airship Industry is, then, a key industry, though it has not been catalogued as such by the Board of Trade. It seems obvious that, unless we deny the possibility of any future wars, it is an industry that must be maintained. Despite this fact, the directors of the economy stunt have closed it down totally and entirely.

Let us now admit the inadmissible, and work on the assumption "that war will be no more." In that case, is the Airship Industry entirely superfluous? It is obvious enough to any thinking man that this is not so. There are plenty of jobs that cannot be performed with any degree of efficiency by any older method of transport, and can only be performed with very poor efficiency by the aeroplane. Wherever we have no prepared land route and no direct and suitable means of communication by water, the airship is the obvious pioneer to develop the beginnings of true commercial communication.

To stop airship construction at the present moment is economy on a par with what would be realised if we were to stop railway services and give up maintaining the roads, harbours, and docks. The advocates of economy seem entirely to have forgotten that economy, in the common sense of the term, is not an end in itself, but merely a means to an end. Its purpose is the creation of wealth. Just as there are more ways of killing a cat than by choking it with butter, so there are more ways of making money than by merely refraining from spending it. The gentleman who hid his talent in the ground was not regarded as the commercial, or even the moral, equal of the man who used his talent and turned one into ten, no doubt taking a certain risk of loss in the process.

AN APOPLECTIC FIT OF ECONOMY.

We are the possessors of an Empire of incalculable value. Its potential value is many hundreds of times greater than its present value. It is awaiting development. Development is impossible without expenditure, and hangs mainly on the provision of means of communication. Yet the Government, for the sake of a stunt, proposes to shut down all progress in respect of one of the most promising means of communication imaginable.

The Airship Industry, in its infant stage, if not actually nationalised, is completely under national control. The treatment it is receiving indicates the kind of risk we run if other means of communication become nationalised. At any moment any Government may be seized with a sort of apoplectic fit of economy. Every section of transport which does not look like paying within the next six months will then be ruthlessly shut down. The transport facilities that remain will be overburdened, but will show an apparent profit, for which the Government will take much credit. Meanwhile the commercial community, and through it the entire nation, will suffer losses thousands of times greater than the apparent profit secured by retrenchment.

Were we to adopt the permanent policy of regarding it as economical to refuse to incur any expenditure on communication that cannot be productive of immediate profit, we should never build a new railway or a new road in any part of the Empire. I have not a vestige of doubt but that there are many projects for railway and road building now on foot, such that a considerable loss in working for a period of years is accepted as inevitable. The capital cost of a railway is very high. The expenditure can only be justified by looking well ahead,

to the time when the railway will have developed sufficient traffic to make it pay. Meanwhile, interest must be paid upon capital. In very many cases an appreciably smaller loss would be incurred if, instead of building a railway at once, we ran commercial airship services for the first three years to develop the traffic up to such a point that the cost of constructing a road or railway would be immediately justifiable. The alternative in every such case is not between making a loss on airships and making no loss upon some other system, but between making a loss on airships and a bigger loss on the other system. In that case true economy would consist in increasing the manufacture of airships and working upon their design and construction to make them truly commercial vehicles. The thing can be done, and somebody will undoubtedly do it. Unless the present Government's policy in this connection is promptly reversed, some other country will get not merely the kudos but the sound commercial advantage of becoming the world's great producer of airships. Their production will give profitable employment to a large amount of skilled labour. It will cause money to flow into the producing country.

Appreciation of Depreciation.

At the moment the whole policy of the British Government appears to be in favour of an outward rather than an inward flow of money. Imports are unrestricted and free, and the Prime Minister has the supreme impudence to tell the British manufacturer that the depreciation of our currency is as good as a substantial import duty. One would imagine that the less the value of the pound sterling the better the Government would be pleased!

Here, in airship manufacture, we have an unexampled opportunity for those who believe in nationalisation to build up an industry, nationalised or State-controlled from birth, and to develop it for the profit of the country. The Government prefers a policy of absurd parsimony masquerading as economy, and is apparently determined to throw away an accumulation of enormously valuable experience simply for the sake of a trifling temporary reduction in expenditure.

The Press that has been vocal on the score of economy has during the past few months been equally emphatic on the importance of commercial aeronautics. It worked strenuously to get the Government to take a long-sighted view of the value of aerial communications. Success appeared to be more or less in sight. Then suddenly the new stunt is officially staged, and our national policy is reversed to conform to it.

Our great job now is to develop the value of the British Empire so as to make good the depreciation in value due to the War. This can only be done by developing our means of communication. Aerial communication will be a big factor. All experts are agreed that in certain spheres the airship is notably superior to the aeroplane. Yet it is seriously proposed to sacrifice probably thousands of millions of Empire value in order that a political opportunist may be able to point out to a grateful and unintelligent community that he has temporarily reduced its financial burden by a few hundred thousand pounds!

A ROOF AERODROME

By Captain M. G. Kiddy (late R.A.F.), Assistant Secretary, The Society of Architects.

Mr. A. W. Gattie, chairman of the New Transport Company, has proposed a Central Clearing House for London goods traffic, having a roof-aerodrome for the landing and taking-off of aeroplanes carrying mails and merchandise.

This sounds very alluring, but I for one should not care to be one of the pilots employed. I do not quarrel with Mr. Gattie's statement that a roof area of 15½ acres provides sufficient space for the landing and taking off of smaller machines of the present-day type; but these machines have not sufficient carrying capacity to justify the enormous expenditure involved in the construction of the proposed building, and it is a question whether machines having sufficient cargo-space to allow the outlay would be able to land and take off from a roof of this size.

The "wind-cornices" suggested by Mr. Gattie would not, in my opinion, solve the problem of air currents, i.e., cross-winds—rather would they tend to increase the danger by exposing the machines to sudden, and possibly violent, gusts the moment the "cornices" were cleared. It is not so much these difficulties which to my mind constitute the danger as the situation of the building itself.

A very frequent source of trouble in flying, and one which one ventures to prophesy will not lightly be overcome, is that of engine-failure just after leaving the aerodrome. Hence an aerodrome is always sited as far as possible in flat surroundings. What is going to happen if the engine fails when the machine has proceeded some 100 yards from the edge of this roof? To turn near the ground when the engine has failed is fatal, and has been the cause of death of more beginners than one cares to estimate. The only thing one can do is to glide straight down and land as best one can, *igitur* the flat surroundings, which obviate accidents. But if the surroundings are the roofs of other houses, what is the pilot to do? He will be lucky to kill nobody other than himself.

Night flying, it seems to me, will increase the danger all round. Mr. Gattie's idea is to light the surface of the aerodrome from underneath. Apart from the effect this might produce upon pilots who are not total abstainers, I should think it would be very difficult to land under such conditions, as the effect of a dazzling surface to land upon is usually that of deceiving the pilot as to the actual whereabouts of the ground. One cannot speak from experience (Heaven be thanked), but one imagines that the effect must be somewhat similar to landing upon an aerodrome lightly covered with snow upon which the sun is shining—a very uncertain business.

The question of night-signals which was raised is not so important as those who discussed it appear to imagine, and could quite easily be settled without the aid of green search-lights or similar jazz-like decorative illuminations. It is quite a minor problem by the side of the others, and caused very little trouble during the war. But in any case machines will only be able to land one at a time, the remainder, as pointed out in Mr. Gattie's statement, having to circle round until the "all clear" signal is given. But who is going to land next? I must confess I should not care to sleep in the surrounding neighbourhood with such a noise in progress every night. The only amusing part about such a state of affairs would be when two pilots tried to land at once. One can imagine that a golfer-missing an easy put would be relegated to the remote shades when this took place.

No doubt Mr. Gattie's architect could design a suitable building in collaboration with an experienced pilot, but even if the constructional and technical difficulties could be overcome, central London would appear to remain a very impossible spot for such a venture. One must conclude that Mr. Gattie would do very much better to adopt as his Clearing House Hounslow, or another convenient aerodrome—that is if he is a sufficient believer in the possibilities of civil aviation to do so.

A SEAPLANE WORKS FOR SALE

The business assets of the Norman Thompson Flight Co., Ltd. (in voluntary liquidation), are for sale by tender.

The company was established in 1912 at Middleton, near Bognor, Sussex, and made the first British-built flying-boat of present-day type. They have made naval and commercial seaplanes and military and commercial aeroplanes and parts. During the war the company was a controlled firm and supplied the Government with large and small flying-boats of their own design.

The premises consist of seaplane sheds, workshops, power house, etc., and cost over £15,000. The plant and machinery cost over £13,000. The worth of the freehold land and stock-in-trade on hand is over £30,000. Particulars and orders to view can be obtained from Messrs. Leask, Clemens and Co., Alderman's House, Bishopsgate, E.C.; or Messrs. Poppleton, Appleby and Hawkins, 4, Charterhouse Square, E.C.

AN AIRCRAFT WORKS DECREASING

Final notice was given on Aug. 27th to 500 out of the 900 remaining employees at Short Brothers' aircraft works, near Bedford, which has been taken over by the Admiralty.

Very large works with a railway were laid down during the war, and at one time thousands of workers were employed on airship work. The firm opened up an estate and built many houses. The district is known as Short's Town.

The attention of Bankers, Merchants, and firms who have houses both in London and Paris is again drawn to the unique facilities offered by this service, which has run throughout the past week without a single breakdown or delay. It permits urgent documents, express goods, or passengers to be transported between London and Paris in an average flying time of 2¼ hours. The service is being operated to demonstrate that, with the use of skilled pilots and fast machines, such an express air service can now be run with sufficient reliability to afford a definite, daily convenience to the business world.

CIVIL AERIAL TRANSPORT NOTES.

GREAT BRITAIN.

The Air Ministry announced on Sept. 5th that the report circulated in the Press a few days ago that a hitch had occurred in the signing of the International Air Convention is without foundation. It is pointed out that aerial communication between London and Brussels is permissible, provided that no goods are carried.

The Air Ministry announced on Sept. 6th that Lt.-Col. W. D Beatty and Lt.-Col. W. O. Raikes, of the Air Ministry, had started at 11.5 a.m. that day from Hounslow for Italy in a Bristol fighter machine with Col. Beatty piloting. Certain outstanding points were to be settled with the Italian authorities regarding civil aerial communication. Stops were to be made at Paris, Lyons, Fréius, and Pisa. It was expected that the machine would reach Rome at 5 p.m. on Sept. 7th.

The Berkshire Aviation Company.

The Berkshire Aviation Co. state that they hold the only two licensed flying-grounds at Derby and Nottingham—respectively Hill Meadow and Sneinton Junction Meadow. Passengers are carried there by Lts. J. D. V. Holmes and Alan J. Cobham (late R.A.F.).

In the last four months flying has been given at twenty different towns, including, besides Nottingham, Derby, and one or two smaller places, Bedford, Chesterfield, Leicester, Loughborough, Northampton, Oxford, Reading, Stoke-on-Trent, and Swindon.

Avro Northern Stations.

During the week ending Sept. 6th 551 flights were made and 1,142 passengers were taken up.

London-Paris Air Services.

The air service to Paris by Aircraft Transport and Travel, Ltd., has run daily since it started, over a fortnight ago. Only on one flight was a landing en route necessary. The pilot made a ten minutes' stop at Marquise Aerodrome to make a small adjustment, and then continued the journey.

The company expected an efficiency of 80 per cent. before they started the service. As flights have been made in both directions every day, except on one, when a 100-m.p.h. gale prevented the machine from leaving Hounslow, an efficiency of nearly 100 per cent. has been obtained.

Among the parcels and goods carried by the machines have been bankers' scrip, leather, films, photographic plates, champagne, sweetmeats, grouse, bills of lading, plans and drawings, dress material, newspapers, millinery, samples of clothing, and Devonshire cream.

Lately the company's agents in Paris have been negotiating for the regular carriage, in consignments spread over various days of the week, of as much as 600 lb. and 1,000 lb. of goods. It is proposed that certain vaccines, which must be used within 24 hours or their potency is lost, should be consigned for aerial transport.

Mr. G. H. Davis, an artist, recently flew to Paris and back on business. During the outward flight he completed two pencil sketches of the country beneath and a wash drawing of the Channel boat nearing Boulogne. The next day, on the return trip, he finished another pencil sketch and a black-and-white drawing of the cloud effects over the Channel.

Handley Page, Ltd., sent a machine to Paris on September 2nd, carrying seven passengers and goods. It left Hounslow at 12.50 p.m. This machine returned to Hounslow on Sept. 4th, and arrived at 5 p.m. During the week on these services Handley Page have carried 33 passengers and 600 lb. of goods.

Blackpool.

Capt. Lloyd (late R.A.F.), an Avro pilot, recently attempted to fly from Blackpool to Barmouth, with a passenger. They left Blackpool in fine weather, but while passing over the Merionethshire mountains in the Corwen district, they flew into a heavy mist which developed into a bad storm.

The pilot experienced great difficulty in controlling the machine, and on coming out of the mist found that they were well out at sea.

Owing to the storm over the mountains a landing had to be made at Rhyl. The journey to Barmouth was completed later.

Brighton.

During the week ending Sept. 6th 50 flights were made from the Ladies' Mile Aerodrome and 100 passengers were carried in Avro machines.

The weather was very indifferent all the week, and it was impossible to fly for some part of every day. On Saturday afternoon passengers were taken up at Chichester, and a cross-country flight from Brighton to Chichester and return with two passengers was made.

Harrogate.

Passengers were taken up during the week ending Sept. 6th in Airco machines.

Herne Bay.

At Herne Bay there are hundreds of spectators and always many passengers waiting their turn. Flights are being given around the Fleet for £3, and already many trips have been booked.

Leicester.

An aeroplane, piloted by Mr. Alan Cobham, who has been conducting passenger flights at Aylestone Park, Leicester, met with a mishap on Sept. 5th. The machine had only risen to a height of 10 ft. when the engine failed.

Mr. Cobham, and two women passengers he was carrying, received bruises and cuts. The machine ran into a thick hedge.

London.

Hounslow.—During the week ending Sept. 6th the Avros made 85 flights and took up 149 passengers. Cross-country flights were made as follows:—One to Margate, one to Weston-super-Mare, two to Brooklands, and one to Woolwich and return.

On Sept. 8th an officer of the Guards chartered an Avro at Hounslow and flew to Hythe. He started at 7 a.m. to be in time for a musketry course which commenced there that morning.

The Avro Co. is not running any regular service to the Continent, but in its capacity as "Air Taxi" is always ready to take passengers there when they want to go. Its first flight to Paris was made on Saturday, Sept. 6th, when the Avro limousine, piloted by Capt. R. T. Fagan, D.F.C., left Hounslow at 4.50 a.m. carrying two Norwegians, Mr. Robshon and Mr. Waase. A non-stop flight was made and Le Bourget was reached at 7.35 a.m.—a flight of 2 hr. 45 min.

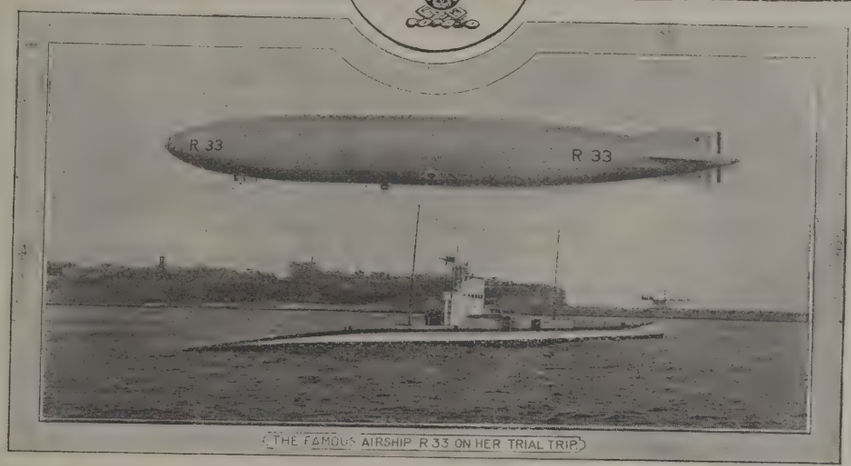
Margate.

Avro flying at Margate has been exceptionally good this past week, and 273 passengers have been taken up, and have thoroughly enjoyed their trips. Many enthusiasts were over 60 years of age, and several under six. There were also a number of celebrities, including a well-known M.P. and his son. Tea is served on the aerodrome, which makes an afternoon at Manston a very pleasant affair.

Norwich.

On Sept. 4th over a thousand people, chiefly women, attended Mousehold Aerodrome, Norwich, to participate in the public draw for the first fifteen free flights given by the "Daily Sketch," the "Evening Standard," and the "Illustrated Sunday Herald."

Fifteen further free flights were given on Sept. 7th. Arrangements have been made also to give flights on Sept. 11th and 14th.



Paignton.

The Avro seaplanes here made 46 flights during the week ending Sept. 6th and carried 76 passengers. Flying was only possible on two days. Cross-country flights were made to Teignmouth and Babbacombe.

Sheffield.

The Sheffield Development Committee and Vickers, Ltd., have arranged to run an aeroplane passenger-carrying service during the Doncaster Races.

You must increase Your exports

:: AERONAUTICAL ::
MOTOR APPLIANCES.

All Goods exhibited must be of British Manufacture.

You are only part of the National whole—your individual success depends entirely on the National prosperity, and National prosperity will sadly fail without Exports multiply.

THE BRITISH INDUSTRIES FAIR (B'HAM.) FEB. 23rd to MAR. 5th. 1920, will bring together the largest congregations of World Buyers that Birmingham has ever seen—no visitor will be there except by the official invitation of the Board of Trade, and every one of them will be "ON BUSINESS."

You MUST increase YOUR Exports, and—you MUST be there.

You can exhibit goods, as at side, in Birmingham.

Application for space, and details too, should be addressed:—

CHAS. STANLEY, General Manager,

BRITISH INDUSTRIES FAIR
AN INTEGRAL PART OF THE BOARD OF TRADE BRITISH INDUSTRIES FAIR ORGANIZED BY THE BIRMINGHAM MUNICIPALITY & CHAMBER OF COMMERCE & HELD CONCURRENTLY WITH THE BRITISH INDUSTRIES FAIRS LONDON & GLASGOW
BIRMINGHAM 1920

Chamber of Commerce, Birmingham.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

Twenty-four passengers can be carried each day in the machines, which will leave the Coal Aston Aerodrome on Sept. 9th, 10th, 11th, and 12th. The prices for the flights will be from £10 to £7 for the return journey and from £6 to £4 for the single journey. Those who pay the highest prices will have least time to wait at the racecourse before the first and after the last race.

SOUTHSEA.

From an aviation point of view, Southsea is very dull. The people, doubtless from having lived so long in a Naval atmosphere, resolutely know nothing whatever of the R.A.F., the aviation firms, or the places where one may find an aviation interest.

On inquiry it was found that no one knew the way to Calshot, except one man, of military origin, who referred to "those stiffs in the R.A.F."

For Lee-on-the-Solent one covers half Hampshire by train, and takes best part of the day to get there by train, ferry, tram, and a walk.

To return to Southsea. The town is more or less thinly placarded with advertisements for the Supermarine Company's boats, which fly, according to the bills, at Ryde, Shanklin, Southampton, etc. For Southsea one applies at South Parade Pier. When the weather is suitable, a boat flies over from Southampton and the South Parade Pier, carrying a blue and white flag. One is now awaiting suitable weather.

In a week the actual number of aeroplanes seen at Southsea were three small land machines—or they may have been float seaplanes—and, possibly, four flying-boats. All were very far out at sea and very small.

Whether these machines were Service or commercial it is impossible to say. But aviation hereaLouts seems almost dead. Of course, one is not sufficiently near Southampton to see the immense activities of the Supermarine Company, and one has not seen anything of their Ryde activities. Possibly, the weather has been against much flying, as it has been squally, and a rather strong South to West wind blowing all the time. Still, the weather has been fine enough, and the sea fairly calm. After all, surely one flew in such weather during the late war?—S. F. B.

SWANSEA.

The weather was far from favourable during the week ending Sept. 6th, and there was no flying on Sept. 1st and 4th, and very little on Sept. 3rd. Altogether 122 flights were made and 214 passengers were taken up in Avro machines. Mr. F. G. M. Sparks is now the manager of the Avro Aerodrome.

WINDERMERE.

In the last two weeks the Avro seaplanes at Windermere have been chiefly engaged with carrying the "Daily News" to Douglas. They completed their contract last Wednesday. After delivering the papers to Douglas for this last time Capt. Pixton filled up with petrol and flew over to Port Erin, and took up a few passengers there. Unfortunately, he could only manage a few, owing to lack of petrol, and he had to disappoint a great number. If he had had enough petrol he could have gone on taking passengers up indefinitely. It is possible he may visit there again before the season closes. One passenger at Port Erin took a passage back to Windermere, calling in at Douglas on the way. The weather was perfect, with not a breath of wind.

To summarise the "Daily News" flights to the Isle of Man—the Avros flew every day during August Bank Holiday week. The papers were taken from the 5.30 a.m. train at Windermere station and conveyed down to the seaplane base, where they were stowed into the machine, and a start was made at about 6.30 a.m. The seaplane usually arrived in Douglas about 8 a.m., and returned to Windermere about noon. About the time the week was finished the Steamboat Co. commenced running night boats three or four times a week, but the Avros continued the service when the boats did not run. They made 12 journeys in all, and only failed to cross three times, once due to engine trouble and twice due to gales blowing. As Capt. Pixton is the only pilot there, he had to neglect the local business somewhat, but the I.O.M. flights have been a splendid demonstration of the usefulness of the Avro seaplane.

AUSTRALIA.

According to the "Melbourne Age," a party is surveying Australia to find sites suitable for landing-grounds. Mr. Reginald Lloyd, the head of the party, has stated that Sydney is to be brought within 6½ days of London.

Mr. Broadsmith, the ex-chief engineer of A. V. Roe and Co., Ltd., has joined the Australian Aircraft and Engineering Co. He will be the direct representative of the Avro Co. in Australia. He is taking out there with him a fleet of Avro seaplanes and aeroplanes. The "Joy-Stick" states that the fleet will be the largest yet seen in the Southern Hemisphere

SOUTH AFRICA.

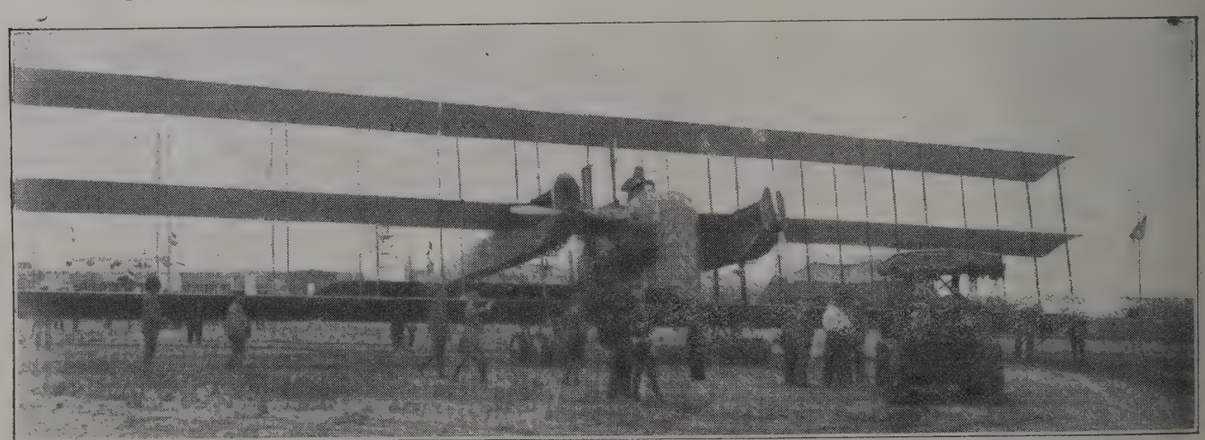
Major Miller (late R.A.F.) and his colleague hoped to start a service between Johannesburg and Pretoria at the beginning of this month. The standard Air Force engines, for the British machines to be used, had arrived on July 31st. Passenger-carrying flights were probably made before the regular service was started.

They also hoped to have two or three machines in Cape Town during the Peninsular season, so that the public would be educated to flying. Major Miller has said that no long services will be started until they have the confidence of the public, when they hope to form a large company entirely with South African capital.

Aerial photographic work will also be done, as there is a great future for that business in the country.

THE ARGENTINE.

Major S. G. Kingsley (late R.A.F.), of Aircraft Transport and Travel, Ltd., has been in the Argentine for some weeks. A cablegram has been received by the above-mentioned company in London to say that he has formed an Anglo-Argentine Aviation Company. No further information is yet available.



BELGIUM.

Further details are now available as to the proposed aerial service over the Belgian Congo. A mission consisting of Capt. Michaux, recently in charge of the Brussels-Paris aerial service, Lieut. Tony Orta, and M. Allard has recently been sent to the Congo by the Belgian Government. This mission is to undertake the actual organisation of the service.

Twelve seaplanes are to be employed on the service between Kinchassia and Stanleyville, a distance of about 1,050 miles. The route is divided into three sectors, and alighting stations are provided in each.

Transport at present takes 24 days to complete the distance by river. By air it is estimated that Stanleyville will be reached in three days, while seven or eight will be taken on the out-and-return journey, including the stay at Stanleyville.

Each machine will be able to carry two passengers, the charge to Stanleyville will be about £130.

Front View of the Caproni Triplane (three 400 h.p. Liberty engines) now at Amsterdam.

BY APPOINTMENT
Anglo-American Oil Co., Ltd.
36, Queen Anne's Gate,
London, S.W.1.

An aerial photographic survey of the country will shortly be made.

The inclusive cost of providing the service will be about £50,000, and it is hoped that the first regular flights over the first sector will be made in February next and that the line will be in complete running order by July, 1920.

FRANCE.

The cyclone on the evening of Aug. 28th did considerable damage at Villacoublay. The large four Hispano engined Voisin biplane, type 12, was completely wrecked. This machine took the French football team to Brussels some weeks ago. Altogether, Voisin's loss from the storm amounted to about two million francs. Other firms on the aerodrome lost in proportion.—E. N.

The Coupe Deutsche, which is given for the fastest flight over a circuit starting and ending at Saint Germain, of which the turning-points are Senlis and Mélun, was won on Sept. 2nd by M. Sadi Lecointe, flying a Spad-Herbemont biplane (300 h.p. Hispano-Suiza). It is necessary for a competitor for this cup to exceed the speed of the previous holder by 10 per cent. before he can be awarded the prize.

M. Sadi Lecointe left Saint Germain (the starting-point is the Pavillon Henri Quatre of the great chateau) at 10 h. 21 min. 5 sec., and arrived back at 11 h. 9 min. 13 sec., having covered in 48 min. 8 sec. a distance of 124.28 miles at a speed of roughly 152 miles an hour.

The previous holder, M. Gilbert, flying a Deperdussin monoplane, covered the same distance in 1914 at a speed of 109 miles an hour.

The Toulouse-Casablanca aerial post, made possible by the ratifying last week of a convention between France and Spain, began its service on Sept. 1st. An aeroplane left Toulouse at 6 a.m. and flew to Casablanca *via* Barcelona, Alicante, Malaga, Tangier, and Rabat.

The official opening of the route will take place on Oct. 1st, when the passenger service will begin.

The lengths of the stages on the Toulouse-Rabat aerial service are as follows: Toulouse-Barcelona, 236 miles; Barcelona-Alicante, 298 miles; Alicante-Malaga, 314 miles; Malaga-Rabat, 212 miles. Total, 1,060 miles.

A league for the development of aerial post in Morocco has been formed in Casablanca. Several big merchants and aviators have already become members. Letters will be carried at a charge of two francs apiece.

An aerial transport service between Nice and Bordeaux will shortly be opened.

A Parisienne recently missed the night train to Cherbourg, where she was to sing the next evening. The price asked for the journey by a motor firm was £100, so she flew in an Air Transport Co.'s machine. The journey cost her £22.

M. Etienne Poulet, who is practising for a flight from Paris to Melbourne, made a series of flights at the "haute école aerienne" at Angers on Sept. 6th and 7th. He is piloting a Caudron biplane (Le Rhone engine).

M. Alexis Maneyrol attempted on Sept. 2nd to fly from Paris to Rome and back in one day on a Morane-Saulnier monoplane (160 h.p. Le Rhone). He left Villacoublay at 5.51 a.m. and landed at Rome at 12.40 p.m. At 15.40 p.m. he left Rome for Paris. He landed, owing to fog, at Pisa at 4 p.m.

Madame Jane Hervieu, who was one of the first women to adopt aviation as a profession, is leaving for the United States. She has signed a contract to act as one of the Curtiss Co.'s pilots.

M. Chevillard, whose skill as an aviator charmed the British on many occasions before the war, left Toussus-le-Noble on Sept 1st for Madrid, piloting a dual-control Farman biplane, type F.46. His instructions were to examine the Paris-Madrid route in order that plans may be made for a future aerial service between the two cities.

GERMANY.

It is stated from Munich that on Aug. 27th revenue officers flying in an aeroplane landed at Bamberg in order to arrest a smuggler. Finding he had left, they flew on to the Swiss frontier, where they awaited his arrival. He was arrested finally with 10,000 marks' worth of unstamped bank notes in his possession.

HOLLAND.

E.L.T.A. NEWS.

A correspondent, writing from Amsterdam on Sept. 2nd, sends the following news:—

The exhibition aerodrome is wetter than ever. The "Kangaroo" is the only large machine now taking up passengers.

Three machines arrived here to-day sent by the French Government—a Farman 40, a Farman 50 and a Nieuport 29. The other French aviators are Fonck, with a "Baby" Spad, and Bourgeois, with a Morane "Parasol" two-seater.

Capt. Gathergood (late R.A.F.), piloting a new Airco D.H.9.R. machine to the exhibition, flew from Hounslow to Soesterberg (25 miles from Amsterdam) in 2 hr. 10 min. on Sept. 5th. The engine is a 450 h.p. Napier. The machine had only been in the air for five minutes previous to the flight.

Capt. Gathergood states that he travelled at a speed of 134.5 m.p.h. Of the many flights which have been made from London to Holland during the E.L.T.A., this flight appears to have been accomplished in the fastest time.

A second Blackburn Kangaroo passenger-carrying biplane has arrived at Amsterdam, piloted by Capt. Wooley. The machine has been inspected by H.R.H. the Prince Consort of the Netherlands and the Dutch Minister of War. The latter's flight in the Kangaroo was his first experience in the air.

£16,000,000 has been subscribed towards the establishment of an aerial port at Ockenburg, near the Hague, according to the "Daily Express" of Sept. 3rd.

ITALY.

A Nieuport-Macchi machine landed at Varese (Como) on Sept. 4th, having made a non-stop flight from Barcelona in 5 hr. 50 min.

The Seaplane Circuit of Sicily, which takes place on Sept. 14th, will be over a course of which the following are the controls: Palermo (departure), Lefalu, Milazzo, Messina, Catania, Syracuse, Cap Passaro, Licata, Sciaeca, Marsala, Trapani, and Palermo (finish). Sixteen Italian and two French entries have been received. The machines entered are mostly F.B.A.s with 160 h.p. Isotta-Fraschini engines. The French entrants are Enseignes de Vraisseau Gizard and de Cuverville.

The Italian correspondent of THE AEROPLANE writes:—Officers, men, and motorists are to prepare the way for the D'Annunzio regularity flight to Tokio. They left Spezia for Bangkok and other towns *en route* on Aug. 25th. The flight is not likely to start before October.—T. S. H.

An Italian soprano who was under an engagement to sing in Paris on Sept. 2nd missed her train at Milan. She hired an aeroplane and arrived in Paris in good time. The pilot made only one landing on the way, at Bron Aerodrome, near Lyons, where he stopped to refill with petrol.

PORTUGAL.

The "Diario de Noticias," a Lisbon news-sheet, states that it intends to offer a prize for a flight from Lisbon to Portuguese Guinea in order to encourage the development of aviation.

NORWAY.

The Handley Page machine piloted by Maj. T. Gran and carrying his wife and other passengers crashed on Sept. 6th. The machine ascended at 10.30 a.m. from the military aerodrome at Kjelles, near Lillestroem (north of Christiania), to fly to Stockholm. One of the engines stopped just after leaving the ground. Maj. Gran endeavoured to make a landing, but the machine fell between some houses and crashed badly. One wing and the undercarriage were completely smashed.

SPAIN.

A free passage has been granted by Spain to all aeroplanes belonging to French companies flying over Spanish territory between France and Morocco. A regular service between these two countries will be started very shortly.

UNITED STATES OF AMERICA.

The inauguration flight of the aerial mail service from San Francisco to Sacramento was made on July 31st. Two other De Havilland machines accompanied the mail plane, which carried as a passenger a well-known San Franciscan dancer.

The National Air Service Co. of Washington state that a regular passenger-carrying service between Washington and New York is to be started as soon as safe landing-grounds have been made.

A service between New York and Boston is also contemplated, and the Chambers of Commerce of both cities have been asked for information as to landing-grounds.

Capt. C. L. Glidden, of the Aero Club of America, has announced plans for an international trans-continental aerial Derby from New York to San Francisco. Over £20,000 will be given in prizes.

The following is extracted from a long article by Otto Praeger, the Second Assistant Postmaster-General, in the "Aircraft Journal," of August 23rd:—

A year and three months ago the regular airplane mail was launched with a little army training plane out of Washington and another out of New York, each carrying 200 pounds of letters.

To-day eight mail airplanes travel 1,900 miles each day despite the weather.

A machine carrying 13,000 letters flies from New York City at 5.0 a.m. every morning for Cleveland and Chicago. It

THE TIELOCKEN AIR-WARM

Tielocken Air-Warm.

A smart and thoroughly serviceable flying coat that, made in exclusive Burberry cloth—the same as chosen by Sir John Alcock for his Transatlantic Flight—lined throughout with lightweight fur, provides Pilot or passenger with an impregnable safeguard that ensures dependable protection, warmth and comfort under the severest conditions.

The materials are especially woven for air work, and withstand intense pressure from wet or wind without the aid of rubber or other air-tight agents, which, by preventing hygienic ventilation, induce condensed moisture and consequent injury to health.

The Tielocken Air-Warm by means of overlapping fronts, doubly shields every vital area of the body. Another advantage is its unique method of fastening, which consists solely of a strap-and-buckle—no buttons to fasten or lose.

Illustrated Catalogue & Patterns Post Free.

TRADE MARK

GODBOLDS

arrives at Cleveland before 9.30 a.m., and at Chicago before 1.30 p.m. This service advances the mail to the Middle West by sixteen hours, and to the Pacific Coast twenty-four hours. A similar service is run from the East.

Since the air mail service started it has covered 272,628 miles, and has carried a total of 11,845,980 letters. If Congress will give the money we will put the air mail next year from the Atlantic to the Pacific in forty hours instead of four days, and from Boston to Havana in a little more than twenty-four hours instead of sixty hours or more by railway and boat.

The service is so costly that as yet it can be established only between the largest commercial and railway centres, where it can expedite the largest amount of mail to the largest number of people. The day will come, but it is not yet, when the air mail will operate between every important city in the United States.

When the Post Office Department inaugurated the aerial mail a delegation of military men connected with flying operations called upon me, accompanied by a colonel of the British Air Force, to dissuade the Post Office Department from attempting to run a daily airplane mail schedule, on the ground that airplanes cannot be flown in rain or fog. But we operated the entire first year, scoring a performance of 92.73 per cent., despite weather and frailties of airplane construction.

The Cleveland-Chicago stage (325 miles) has been flown daily since May 15th without a single forced landing from engine or any other trouble. The service has been carried on, with rebuilt D.H.4 biplanes with Liberty engines, through 80 m.p.h. gales, the aeroplanes flying both ways. Since the inauguration of the service only two aviators have lost their lives.

The Post Office Department has contributed directly to the advancement of aviation in (1) demonstrating the possibility of maintaining a dependable daily schedule by aeroplane all the year round; (2) giving encouragement to an inventor and causing his improved type of compass to be put into general use; (3) encouraging an inventor in the development of a self-cleaning, non-cracking sparking plug; (4) requesting the Bureau of Standards to work on a device to allow aviators to locate or accurately spot a landing ground by sound when it is perfectly invisible; (5) testing and adopting the gyroscopic turn indicator, to enable pilots to keep their machines straight in a fog; (6) by using a new alcohol fuel.

The Department is converting a D.H.4 machine into a twin-engined aeroplane capable of carrying 600 lbs. of mail. Fitted with two 150-h.p. Hispano-Suiza engines the machine travels at 103 m.p.h. with both and 80 m.p.h. with one engine. Two six-cylinder 200-h.p. Liberty engines are to be installed in this machine.

All of the planes in the air mail service are being made safe against fire by completely isolating the engine and gasoline compartments by asbestos fire walls. Each compartment is protected by pressure fire extinguisher system, and the mail itself is safeguarded by non-inflammable canvas bags.

In spite of this record of the mail service Congress is being asked to put this with the other air services under military and unified control, on the assumption that the Post Office Department cannot operate a separate air mail service as economically as it might be operated by a military organisation. An investigation of the cost of military flying as compared with the cost of the air mail operations will settle that contention conclusively.

* * *

Rice growers at Colusa are contracting with a local company for an aerial patrol to protect 15,000 acres of rice from the ravages of ducks, geese and mudhens. It is believed that the regular flight of aeroplanes over the fields at low altitude will so frighten the birds that they will leave for other parts.

A COMPLIMENT TO THE WRIGHT COMPANY.

The Director of Air Service, Washington, states that the following telegram is being sent by the Air Service to Mr. Orville Wright:—

> "The congratulations of the Air Service are extended to you on the tenth anniversary of the delivery of the first airplane to the Government of the United States, first in the world to acquire a dynamic aircraft. The Air Service appreciates to the full the ever-increasing debt owed by mankind to the Wright Brothers, whose foresight, indefatigable research and practicable application have aided world progress through the invention of a new means of communication.—MENCHER."

"It will be recalled that 10 years ago, on July 30th, the United States acquired the first airplane. The Government was the first in the world to be the possessor of an airplane, but had, however, no pilots. Later in the season the following American Army Officers were taught to fly by Wilbur Wright, 1st Lieut. Frank P. Lahm, now Colonel, and 1st Lieut. B. D. Foulois, now Brig.-General.

"On July 30th, 1909, Orville Wright and B. D. Foulois together made the second and final trial flight with the Wright machine contracted for by the Government the year before. This was a cross-country trip of five miles in each direction, with and against the wind. The speed made was 42 miles an hour. On July 27th the endurance test of one hour was made in a flight which totalled 72 minutes, with 1st Lieut. Frank P. Lahm. Lieut. Lahm has the distinction of being the first American Army Officer to fly.

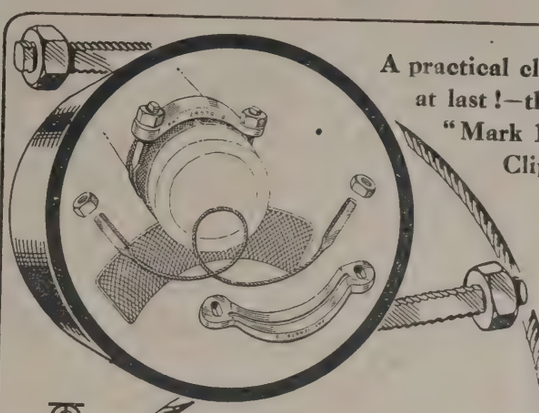
"While the Wright Brothers were negotiating in foreign countries for the sale of patent rights, they were communicated with by the United States Government, and in the winter of 1907 the Chief Signal Officer, General James Allen, advertised for bids for an airplane. Of 22 bids three were accepted. The Wright Brothers were the only ones to deliver a machine. In September, 1908, official demonstrating flights were begun at Fort Myer, near Washington, in the fulfilment of the contract, but the death of 1st Lieut. Thos. E. Selfridge, passenger, and the accident to Orville Wright, the pilot of the machine, postponed flights until 1909. Lieut. Selfridge was the first man in the world to be killed by a power-driven airplane.

"The contract price of the machine was $25,000. The maximum speed demanded was 40 miles an hour, with a bonus of 10 per cent. for each mile per hour in addition. The Wrights received $30,000 for a speed of 42 miles per hour. This was paid out of the funds of the Board of Ordnance and Fortification."

AEROPLANE ENGINES FOR SALE.

The Disposal Board of the Ministry of Munitions has for sale several 75 h.p. aero engines. It is stated that they are suitable for stationary groundwork. A 200 h.p. 8-cylinder aeroplane engine has been installed in a factory. Coal gas is being used as a fuel, and the engine is running satisfactorily.

A Belfast daily newspaper is stated to use an ex-R.A.F. engine in their printing works.



Three-quarter Back View of the Caproni Triplane (three 400 h.p. Liberty engines) now at Amsterdam.

A practical clip at last!—the "Mark 1" Clip.

NO LEAK at 250lbs. pressure!

At a recent test, the Simko water pipe clip held a joint at over 250lbs. pressure per square inch. This efficiency is due to the powerful contracting action of its stranded wires and prepared webbing. The simplicity of its construction, and the fact that it can be fitted and dissembled indefinitely, clearly show its advantage over ordinary clips.

MINISTRY OF MUNITIONS.

BY DIRECTION OF THE DISPOSAL BOARD.

FOR SALE BY TENDER.

2,177 Aviation Helmets

Tenders are invited for the helmets lying at the Royal Army Clothing Depôt, Grosvenor Road, Pimlico.

Application to view the helmets in bulk should be made to the C.O.O. at the above depôt.

Forms of tender may be had and samples seen on application to the Controller, Textiles, Leather and Equipment Section, D.B.3.b.4., Ministry of Munitions, Room 716, Caxton House, Westminster, S.W.1. Tenders returnable by 10 a.m. on 19th September.

Telegraphic address:—"Dirawmat, London."
Telephone—Victoria 8540 Ext. 263.

NOTE.—For "SURPLUS," the detailed list of surplus Government property for sale, apply at the nearest bookstall or to a local newsagent (to whom a standing order should be given). Compiled by the Director of Publicity, Ministry of Munitions, Whitehall Place, London, S.W.1. Price 3d.

AN INSTITUTE OF AERONAUTICAL ENGINEERS.

To-morrow, Sept. 11th, at 7.30 p.m., a meeting is to be held at 180, Sutherland Avenue, Maida Vale, W.9, by the embryo society known as the Institute of Aeronautical Engineers, which must not be confused with the affair which calls itself "The Aeronautical Institute."

To quote from the card of invitation, "matters of extreme importance to the aeronautical profession will be discussed and the scope and purpose of the Institute will be further determined." Mr. L. Howard Flanders will preside.

The older readers of THE AEROPLANE will remember Mr. Flanders as one of the pioneers of aviation who built a machine of his own at Brooklands, and before that was connected with the firm of A. V. Roe.

The objects of the Institute of Aeronautical Engineers are to promote theoretical and practical courses of instruction and to publish a periodical as an educational and reference work. It is proposed that all aeroplane design pupils should be taught to fly, as it is thought that "only by having flown various types of machines can the designer tell the degree of sensitiveness that is attainable."

There are to be five grades of membership—viz., Members, Associate Members, Pilots, Students, and Honorary Members. The first three will be designated M.I.Ae.E., A.M.I.Ae.E., and P.I.Ae.E. respectively.

The following letters give an indication of the reasons for calling the meeting :—

"Dear Sir,—In view of the strong trade union movement and of the Prime Minister's statement that the wishes of no body of people can be considered unless they are organised, it is high time that aeronautical engineers and pilots were organised to form one branch of the various middle-class unions that are springing up, the Society of Technical Engineers being an example.

"Such a union would ensure that pilots and others were adequately remunerated and that they received a suitable share of prize-money won in public competitions. Reasonable insurance rates for flying risks would be insisted upon, and the union would keep a record of the abilities of its members so that vacant posts would be filled by men with the requisite knowledge and experience.

"Under the existing laws such a society is an illegal conspiracy unless registered as a trade union. Consequently, I strongly urge that this society be primarily organised for the members' benefit and that it be registered under the Trade Union Act to enable it to work without fear of prosecution.

"I would suggest that as aeronautical work is of such a specialised nature all manual workers and draughtsmen be invited to join either as affiliated members with the consent of their own respective unions or separately.

"Personally, I regard this as an urgent matter, and I tried to do something on these lines in 1916, but pressure of work prevented my doing much.—(Signed)

"L. HOWARD FLANDERS."

The following is the reply to Mr. Flanders' letter from the organising secretary, Mr. Shaw :—

"Dear Sir,—I thank you for your letter. While I originally intended that the Institute of Aeronautical Engineers should deal with matters of technique rather than what I call industrial politics, you have convinced me that it should be organised to protect the various interests of designers, constructors, pilots, and aircraftsmen.

"I am therefore going to suggest that the scope of the Institute should be broadened so that it may serve the purposes which you have outlined. I therefore think it would be advisable to form the Aeronautical Defence Union under the auspices of the Institute of Aeronautical Engineers. The Institute would carry out the programme originally intended. The Union would be the Protection Society. Those who could not belong to a trade union could still be eligible for membership of the Institute, and members of the Union could proceed to the Institute for their examinations and diplomas.—(Signed) W. R DOUGLAS SHAW."

THE GOVERNMENT AND AIRSHIPS.

A meeting of those interested in commercial aviation was held in Australia House, Strand, on Sept. 8th, to discuss with representatives of the Air Ministry the question of the disposal of airships and the Government's policy for assisting aerial commercial enterprise. Representatives of all the large aircraft-producing firms were present.

As THE AEROPLANE was not allowed to be represented at the meeting it is impossible to give a verbatim report of the discussion. One is indebted to the "Times" for the following report :—

"Major-General Seely, Under Secretary of State for Air, presided. He said the Government was anxious to do the best it could for the State in the disposal of the lighter-than-air type of machine, and, at the same time, to aid commercial enterprise. The Air Ministry had been handed over a certain number of machines, and the Admiralty, having been consulted about its demands in the future, had reported that when the political situation cleared away—say in a month's time—it would be able to give a definite reply as to the number of airships and aerodromes it would require in case of emergency. The Air Ministry and the Admiralty would then combine to offer existing machines and machines in various stages of construction to those who would undertake the formation of a commercial air scheme. The assistance would include the use of wireless stations and meteorological information, and the Post Office would help in every possible way. In the case of any well-founded scheme airships would be sold at a very cheap rate. Business people would also have the advantage of sheds and trained personnel, and would have help in dealing with terminal points. The future of such a scheme was boundless, and he was sure that if they went into it in a businesslike manner, they would retain the supremacy in the air they had gained during the war.

"General Seely, answering criticism, said it would be wise for the Government to allow the firm to build any class of airship which might be deemed useful for commercial service, because any ship would be more useful to the Government, in hostile circumstances, than no ship at all. It was urgent on political grounds that the scheme should be launched as soon as possible. Air machines received from Germany would be included in the total that would be handed over for commercial purposes.

COMMITTEE TO DISCUSS DETAILS.

"Sir Trevor Dawson (Vickers Ltd.) approved the scheme in view of the promise of Government support, and suggested the formation of a committee of financial representatives to discuss details.

"Mr. Holt Thomas, Mr. Short (Bedford Aviation Company), Sir Glynn West (Armstrong, Whitworth and Co., Ltd.), and others expressed approval of the scheme, and it was decided to form the committee suggested, to meet General Seely, General Sykes (Controller-General of Civil Aviation), General Maitland, and other officials of the Air Ministry, to discuss details

"General Seely said he had the assurance of Lord Inverforth that red tape would not be allowed to hamper the negotiations in connection with the scheme. The matter was too important to brook delay. He was quite sure they would make the airship service of great good to the State, and they would have every possible chance to take the lead in the matter of airships, for the good of the Empire and mankind generally."

AERIAL KISSES.

The "Aerial Age," of America, published the following :—

"Sensational acrobatics that made Eddie Stinson, heretofore the most finished of the air pilots who have been amazing the throngs at the Atlantic City Airport, hold his breath from his "orchestra seat" a little off to one side in his own aeroplane, featured when Lt. Omer Locklear, former Army sky-skipper, mounted five times from one aeroplane to another by means of a rope ladder swinging clear in the air. Crowds below, who had been told that the lieutenant, who was the first man to jump from a plane above to the one underneath, would attempt to reverse the order, could see him standing upright on the upper wing and reaching for the ladder as one machine manœuvred by Lt. Melvin Elliott hovered over a second piloted by Lt. Shirley Short

"But it was Eddie Stinson who brought the real story of the manœuvres to the ground. 'I have seen some nice balancing and daring driving of aeroplanes, but those two pilots and Lt. Locklear showed me something new to-day,' declared Stinson, who himself was chief of aerial acrobatics in south-western army flying fields throughout the war.

"'While Lt. Locklear was swaying back and forth on top of the Short machine, Lt. Elliott swooped down from above, and so much confidence did those two drivers have in one another that the machines actually kissed one another, making it necessary for Lt. Locklear to drop and stretch out flat on top of the plane. Yet with cool daring he flipped upright again and grabbed for the ladder as they pulled away. It was the most remarkable aerial stunt. It was one of the most daring bits of game flying I have even seen.' Eddie had been up with a photographer, trailing the two planes throughout the trips.

"Crowds below knew nothing of the aerial kiss, but they saw the machines so close together that they looked as one skooting through the sky over a thousand feet in the air. Lt. Locklear, baffled by the wind, made three desperate trips across the field standing up on the wings of the aeroplane, while the throngs below nervously clutched one another fearing that he would be dashed to death at any instant. Just to show that he was still perfectly cool he proceeded to climb all over the plane as it swooped down within a hundred feet of the ground, once hanging by a precarious hold to the skid at the extreme tip of the right wing, and again hanging by his knees from the axle of the landing gear beneath the fuselage, permitting the wind to swing him back and forth head down like a pendulum."

AIRCRAFT FINANCE

CURRENT TOPICS

NATIONAL ECONOMIES AFFECT SHARE VALUES.

It is feared that the Government's drastic economies in departmental expenditure must seriously react on the Aircraft Industry: already the shares are drifting to a still lower price-level. In the circumstances it is useless to blame the investor for developing "nerves" and throwing over such securities. It is the common belief that the manufacturing industry is still wholly dependent on Government orders. This is not so, of course, but it must be confessed that the volume of business from that source has been helpful during the transition period.

FUTURE UNCERTAINTIES.

Anyway, the event may prove to be a blessing in disguise, in so far as the industry must work out its own salvation without delay and without expectation of a few "crumbs" from the table of the Treasury. Of course, it is a reversion to the old policy of *laissez faire*, unblushingly served up with a few trimmings. It may, however, enable commercial aviation to start with certain advantages derived from the uncompleted Government scheme. The Government cannot expect to obtain much for what it now proposes to jettison in the way of airships and stations and stores, so that the capital cost to the commercial venture would be comparatively small. There is some consolation to be derived from such a reflection, but only on the assumption that there are capitalists with sufficient confidence to seize the opportunity. The Government having paid for its experience, the newcomer should profit thereby.

INVESTORS EXPECTED PROTECTION.

Such consolatory reflections, however, are negatived, or, in any event, neutralised, by the present economic position of the Aircraft Industry. The amount of capital at stake is considerable. Many people were induced to risk their money in aircraft propositions by the excellent war services so often belauded by responsible officials and by the belief that as a reward therefor a certain measure of protection would be accorded to the industry for a reasonable period after the war.

SOME OF THE MOVEMENTS.

In the case of Aircraft Manufacturing "B" Preference shares the price has fallen away to 14s. Not so long ago these were selling well over £1, and were then considered reasonably valued. After their recent recovery Handley Page Participating Preference have also suffered a setback, being not better than 15s. 3d. Waring and Gillow have many other irons in the fire than aircraft business, and for that reason have not been much affected so far. The same applies to Armstrong Whitworths and Vickers, both of which companies can afford to nurse their aircraft business until times are more propitious.

MILLIONS THAT MUST BE RAISED.

One hopes that something concrete will result from the great aerial liner scheme discussed by its sponsors in the Press with so much enthusiasm. At the same time it must be confessed that the financing of such a venture to the tune of £2,000,000 will not prove an easy task. On the contrary, it may prove an insurmountable obstacle, for the man in the street has yet to be convinced of the economic and physical efficiency of an aerial passenger-service. The hint that the large brewery companies intend to help the scheme must strike the average person as being a little ornamentation and nothing better.

SUBSIDIES: A SUGGESTION.

What is absolutely necessary in order to help the financial consummation of such an aerial transport venture is assistance from the Government. This help should take the form of a subsidy similar to that enjoyed by the big mail steamships. The fleet would constitute a reserve for military purposes just the same as the Blue Ensign.

W. J. DAVIES.

JOHN DAWSON AND CO.

John Dawson and Co. (Newcastle-on-Tyne), Ltd., aeroplane manufacturers, Newcastle-on-Tyne, and Wallsend.

A largely attended meeting of the creditors of the above was held on Aug. 9th, at the Institute of Chartered Accountants, Moorgate Street, E.C. Mr. H. B. C. Baldwin, C.A., of 29, Lincoln's Inn Fields, W.C., stated that the shareholders of the company had passed resolutions in favour of voluntary liquidation, and he had been appointed to act as the liquidator.

The figures, which he was submitting, would have to be regarded as entirely approximate, and a considerable time would elapse before a complete statement of affairs could be prepared. The liabilities totalled £105,865, being made up as follows: Preferential creditors £2,122, secured creditors £28,592, unsecured creditors £50,164, and contingent claims £25,885. The book value of the assets was £108,563, and, in certain circumstances, he felt he was justified in assuming that they would realise £91,872, or a deficiency of £13,993.

The principal secured creditor was the London, City and Midland Bank, whose claim aggregated £27,361. The security held by the Bank consisted of the deeds of the Wallsend property, which was a large and well-equipped factory. There was a debenture registered for £30,000. The debenture was held by the Ministry of Munitions, but nothing was due on it, as the company had fulfilled all the conditions laid down in connection with its issue.

A creditor said it was rather curious that the debenture was given on April 10th of the present year, and that as soon as the necessary three months had elapsed the company went into liquidation.

Mr. Baldwin said that was not the correct view to take. The company had a large contract with the Air Board, who refused to find any more money. The directors said that unless more money was found they would be unable to carry out the contract, and it was decided to give the debenture to secure any further advances made by the Air Board.

The advances were subsequently wiped out by the work done by the company. Mr. Humphrey, the governing director of the company, had been included as a contingent creditor for £10,701, and at least £8,000 of that amount represented cash advanced to the company. The other two directors were each contingent creditors for considerable amounts, but he was unable to give details of the claims. Messrs. Napiers, Ltd., were also contingent creditors for £5,000.

Under the Articles of Association the governing director had power to fix his own remuneration up to £1,000 a year, and also that of the other members of the Board. The remuneration of Mr. Humphrey had been fixed at £2,500 a year, while that of the other two directors had been agreed at £1,500 per annum. Messrs. Luke, Turner and Co. were claiming £3,200 in respect of a cancelled contract in respect of aircraft.

Mr. Baldwin further stated that attempts had been made to sell the assets of the company to another concern which was taking up the manufacture of furniture. A second business would also be transferred to the new company. A prospectus had been prepared and a firm of promoters approached. The promoter thought it was a proposition that could be brought out. The issue of the new company was to have taken place on July 28th, but was deferred in consequence of the disturbed state of the labour market. It was, however, believed that the matter could be proceeded with in the near future. From the new concern it was proposed that the present company should receive £45,000 in cash for the Wallsend factory in Lawrence Road, while £8,500 in

shares would be handed over for the preliminary work which had been done. The company possessed other assets of a substantial nature.

The company was formed in January, 1917, to manufacture Handley Page and D.H. spares, and during the first twelve months it did well. Last year the A.I.D. came down on the company and insisted on the organisation being largely increased. An enormous number of inspectors were taken on, and the overhead expenses increased to a very large extent. During the last three months of last year the unproductive wages represented no less than 75 per cent. of the wages bill.

A petition had been presented to the Court for the compulsory winding-up of the company for the voluntary liquidation to be continued under a supervision order. The hearing of the petition had been adjourned pending the holding of that meeting of the creditors. The company possessed a magneto of its own which was believed to be of value. It was hoped to sell the magneto rights to a syndicate or another firm engaged on similar work. There was an enormous stock on the premises, but most of it belonged to the Government. The company entered into a contract to build a large bombing machine. The arrangement was that the company should manufacture a machine, and if it came to within 10 per cent. of all that was claimed for it John Dawson and Co. would have a licence for the manufacture of the aeroplane. It was in connection with that machine that the contingent claim of Messrs. Napier's for £5,000 arose.

Mr. O. Sunderland, of the Motor Trades Guardian Association, proposed that application should be made to the Court for the appointment of Mr. E. H. Hawkins, of Messrs. Foppleton, Appleby and Hawkins, 4, Charterhouse Square, E.C., as joint liquidator of the company.

Mr. A. Houstoun seconded the motion, which was agreed to on a show of hands, and a committee of five of the principal creditors was also nominated.

BEARDMORE MOTORS, LTD.

BEARDMORE MOTORS, LTD.—Private company. Registered Sept. 2nd. Capital £100,000 in £1 shares. To take over the business carried on by Aidee Motor and Engineering Co., Ltd., and to carry on the business of manufacturers of and dealers in motor-cars, carriages, vehicles and boats, aero engines, aeroplanes, motor-launches, etc. The subscribers (each with one share) are:—H. L. Smith, 62, Grosvenor Road, Canonbury, N.5, clerk; H. W. Eason, 149, Tufnell Park Road, N.7, clerk. The first directors are:—Sir Wm. Beardmore, Bt., J. G. Girdwood, P. M. Luther, and C. H. Allsworth. The two first-named are nominees of William Beardmore and Co., Ltd., and the two last-named are nominees of the Aidee Motor and Engineering Co., Ltd. Remuneration £250 per annum. Solicitors: Nicholson, Graham and Jones, 24, Coleman Street, E.C.

RECEIVERSHIPS (Appointment or Release).

AERO TANKS, LTD.—A. Charlesworth, of 20, Copthall Avenue, E.C., and W. R. Gaff, Capel House, E.C., as receivers on July 26th, 1919.

A. Turner, May 11th; Lt. H. G. Thornton, June 12th; Lt. (Hon. Capt.) V. F. Davies, June 19th; Capt. S. M. Harding, July 1st; Sec. Lt. P. C. Heming, July 2nd; Lt. W. F. Thrutchley, July 8th; Capt. C. E. Ruah, July 24th; Flying Officer G. M. Edmonston, Flt. Lt. E. Stroud, Aug. 2nd; Flt. Lt. J. H. Taylor, Aug. 3rd; Flying Officer A. W. McClellan, Aug. 6th; Flying Officer D. H. Blaikie, Sqdn. Ldr. A. Partridge, Aug. 12th; Pilot Officer C. B. Dolphin, Aug. 13th; Pilot Officer F. A. Dickinson, Aug. 17th; Pilot Officer (Hon. Flying Officer) P. Rourke, Aug. 18th; Flying Officer W. J. Cooper, Flying Officer S. T. Fradd, Aug. 19th; Flt. Lt. J. Hollingworth, Flt. Lt. J. G. Schon, M.C., Aug. 20th; Flt. Lt. C. C. Carlisle, Aug. 21st; Flt. Lt. W. A. Andrews, Aug. 22nd; Flt. Lt. J. C. C. Affleck, Pilot Officer A. A. Dolphin, Aug. 23rd; Flt. Lt. W. G. Everingham, Aug. 24th.

The initials of Capt. R. P. J. McCoy are as now described, and not "R. P. T." as stated in "Gazette," Aug. 22nd.

The surname of Capt. A. A. Bryce-Buchanan is as now described, and not "Bryce-Burdon," as stated in "Gazette," April 1st.

The notification in "Gazette," May 23rd, concerning Sec. Lt. R. E. Pudney is cancelled

The notification in "Gazette," June 3rd, concerning Sec. Lt. (Hon. Capt.) E. R. Loder is cancelled.

MEDICAL BRANCH.—T./Capt. A. E. Panter is granted the actg. rank of Maj. whilst specially empld., Aug. 1st.

Flying Officer G. Hughes is transferred to the unempld. list, Aug. 13th.

The initial of Capt. O. Gleeson (Capt., R.A.M.C.) is as now described, and not "A." as stated in "Gazette," Sept. 2nd.

DENTAL BRANCH.—T. H. Jones is granted a temp. commn. as Flying Officer, Aug. 30th.

Lt. G. H. W. Randall is transferred to unempld. list, April 2nd.

CHAPLAINS BRANCH.—Rev. M. J. Dunne (late temp. Chapln. to the Forces, 4th Cl., R.A.C.D.) is granted a temp. commn. as Chapln. with the relative rank of Capt. (Roman Catholic), Aug. 2nd.

Asst. Principal Chapln. (Wesleyan).—The Rev. A. S. Bishop is granted a temp. commn. as Chapln. with the relative rank of Capt., April 26th, seny. Jan. 1st, and is granted the relative rank of Maj. whilst empld. as Asst. Principal Chapln. (Wesleyan).

MEMORANDA.—The following Overseas Cadets are granted temp. commns. as Sec. Lts., with effect from Feb. 15th, and relinquish such commns. with permission to retain the rank, from the day following termination of the standardised voyage in the case of those claiming immediate repatriation and from the day following demobilisation in England in all other cases:—212676 S. F. Anderson, C.M.G., D.S.M.; 152750 P. McShane, S6469 W. P. Turner.

The following Cadets are granted hon. commns. as Sec. Lts.:—7547 O. T. Curtis, 635996 F. W. Cotton, 42717 H. B. Fellowes, 202346 J. Little-Johns, 3204 M. A. K. Smith, 16828 A. J. Spacey, 203217 M. W. Todd, 2152 T. A. Williams, 62904 J. Wiseley, Jan. 4th; 45376 J. H. Baird, 42855 A. M. Brown, 7664 J. Ediss, Jan 5th; 47837 E. Adams, 92517 F. Banham, G/29791 W. T. M. Branson, S/29943 C. W. Benstead, 251026 W. L. Clifford, 12599 D. Easson, 21121 J. Forbes, 250422 M. I Green, H270958 F. R. Grundy, 30319 L. R. Hilsdon, 48043 W. B. McMillan, 33138 C. Rhodes, 840633 A. E. Doherty, 71418 E. Ross, April 8th; 940534 J. I. Blackburn, 137092 D. S. Richardson, April 28th.

Lt.-Col (actg. Brig.-Gen.) C. C. Marindin, C.B.E., D.S.O. (Maj. (Bt. Lt.-Col.), R.G.A.), relinquishes his commn. on ceasing to be empld., Sept. 1st.

Transferred to unempld. list:—Capt. C. B. Baker, May 2nd; Pilot Officer T. A. Bayly, July 17th; Flt. Lt. H. N. Nowell, Aug. 7th; Pilot Officer J. M. Fraser, Aug. 10th; Flt. Lt. H. F. Barge, Pilot Officer J. A. S. Cooke, Pilot Officer E. Hanley, Pilot Officer T. S. Laird, Aug. 14th; Pilot Officer C. S. Buckingham, Aug. 15th; Flying Officer W. H. Date, from (S.O.), Flt. Lt. H. M. Farnshaw, from (S.O.), Aug. 18th; Flt. Lt. (actg. Sqdn. Ldr.) C. L. Bullock, O.B.E., from (S.O.), Aug. 19th; Pilot Officer T. E. Fisher, Pilot Officer E. Fortin, Aug. 22nd; Flt. Lt. H. S. Neville (S.O.), Aug. 31st.

PERSONAL NOTICES.

NAVAL.

BIRTH.

ENGLAND.—On Sept. 2nd, at Penlee, Lee-on-Solent, the wife of Squadron Leader T. H. England, D.S.C., A.F.C., R.A.F.—a daughter.

MILITARY.

DEATH.

LEE.—On Sept. 1st, killed in a flying accident, Brigadier-General Lee, C.M.G., son of Major W. F. Lee, Grove Hall, Knottingley.

MARRIAGE.

COOKE—HALL.—On Aug. 20th, at Weybridge, Sapper Cooke, N.Z. Engineers, was married to Miss Winifred Hall, W.R.A.F.

ENGAGEMENTS.

HAWKINS—SPENCER.—The engagement is announced between Alfred Cyril Spencer Hawkins (late R.F.C.), only son of Mr. and Mrs. Alfred Tolhurst Hawkins, of 42, Portland Place, W., and Beryl Sefton, younger daughter of Mr. and Mrs. Alfred Spencer, of 70, Inverness Terrace, Hyde Park, W.

RIDDELL—BULLER.—The engagement is announced of Capt. Patrick Cameron Oliver Riddell (late the Wiltshire Regiment and R.A.F.), elder son of the late Patrick Riddell and Mrs. Riddell, Noirmont, Weybridge, to Alice Moubray, younger daughter of the Rev. Spencer R. A. Buller, R.D., and Mrs. Buller, the Rectory, Weybridge.

SOUTHGATE—FOLKARD.—A marriage has been arranged, and will shortly take place, between Lieut. F. W. Southgate, late R.F.C., third son of Henry Southgate, Needham Market, Suffolk, and Angela, elder daughter of Mr. and Mrs. Folkard, Addiscombe, Surrey.

BIRTHS.

BARTON.—On Aug. 28th, at Victoria Road, Bushey, Herts, to the wife of Sydney Barton (late R.F.C.)—a son (Douglas Searle).

HAMILTON.—On Aug. 31st, at Heighington, Lincolnshire, the wife of Mr. E. V. C. Hamilton, Worcestershire Regt. and R.A.F., of a son (John Colley Colclough).

WATTERS.—On Sept. 4th, at 19, Drumsheugh Gardens, Edinburgh, the wife of Capt. W. Watters, late the Border Regt. and R.A.F., of a daughter.

AIR FORCE.

DEATHS.

HARBORD.—Lieut. Lionel Anthony Harbord, R.A.F., who died on Aug. 21st at Airpark, Lahore, India, was the husband of Sophy Harbord. He was 49 years of age.

EVERSDEN.—Capt. Robert Ernest Eversden, R.A.F., late 1-1st Suffolk Yeo., was accidentally killed on Aug. 15th at the aerodrome at Ekaterinodar, S. Russia, while serving with General Denikin's Mission. He had been on active service since 1915, in the Dardanelles, Egypt, Palestine, and German East Africa. Capt. Eversden was the son of Catherine Eversden, of Ley Hill, Chesham, Bucks, and was 24 years of age.

MORRIS.—Lieut. Herbert Stanley Morris, R.A.F., whose death was announced last week, came to this country in October last, and joined the R.A.F. as a Flight Cadet, and was, prior to being posted to Netheravon, a pupil in aviation with 29 Squadron, R.A.F., Croydon. He was born in South Africa 30 years ago; he was educated at the Cape University, and specialised in Indian, Roman, and Dutch Law, and held the position of Magistrate at Suva, the capital of Fiji.

At the inquest at Maidenhead on Aug. 15th Capt. R. S. Aitken, R.A.F., stationed at Netheravon (Wilts), said that on Aug. 14th he instructed Mr. Morris to go up for landing practice. He was only to go round and round the aerodrome. No one knew why he had come to Maidenhead. He went quite on his own account. Mr. Morris had an average experience as a flier. Witness examined the wrecked machine. It was a "Bristol Fighter." In his opinion, the machine before the flight was in perfect order. He thought Mr. Morris tried to find a place to land, shut off the engine, and lost flying speed, and then either spun down spirally or nose-dived to the ground. It was one of the commonest of flying accidents. The inquest was adjourned.

NELSON.—On Aug. 6th, at Craven Cottage, Eastbourne, Molly, the dearly loved wife of Capt. C. H. Nelson, R.A.F.

ENGAGEMENTS.

ANDERSON—YEO.—The engagement is announced between Lieut. David Stewart Anderson, R.A.F., son of the late Mr. C. D. Anderson, and nephew of Mr. R. Woolley Walden, J.P., and Phyllis Jessie, only daughter of Mr. and Mrs. James Yeo, Woodhurst, Warlingham, Surrey.

BATES—HASKETT-SMITH.—The engagement is announced between Lieut. Harry Bates (late R.A.F.), son of the late Mr. Tom Bates and Mrs. Bates, of Dewsbury, Yorkshire, and Kathleen Antonia, only daughter of Mr. and Mrs. H. F. Haskett-Smith, of Teignmouth, S. Devon, and granddaughter of the late Capt. Haskett-Smith, of Weston, Bath.

BEEVOR—MINTY.—The engagement is announced of Ralph Branthwayt Beevor, late 28th Squadron, R.A.F., eldest son of Mr. and Mrs. Ralph J. Beevor, of Reymerston, St. Albans, and grandson of the late Sir Thomas Beevor, Bt., and Phyllis Margaret Ashburner, eldest daughter of Mr. and Mrs. H. O. Minty, of Nessfield, St. Albans.

FANE—BACON.—The marriage arranged between Capt. Gerard Fane, D.S.C., R.A.F., and Miss Rhoda Bacon will take place on Wednesday, October 1st, at 2.15, at St. Andrew's Church, Raveningham, Norfolk.

LYON—STORY.—The engagement is announced of Mr. W. A. Lyon, R.A.F., youngest son of the late Dr. Robert Lyon and of Mrs. Lyon, 10, Baskerville Road Wandsworth Common, and Sylvia Ellen, younger daughter of Capt. and Mrs. E. U. Story, Cherry Garden House, Folkestone.

MASKELL—KNIGHTS.—A marriage has been arranged and will take place at an early date (leave permitting) between Flight Lieut. A. S. Maskell, R.A.F., of "Benicree," Glencairn Park Road, Cheltenham, and Nellie, daughter of Mr. and Mrs. W. B. Knights, of "Basil House," York Road, Great Yarmouth.

SNOW—LIVESAY.—The engagement is announced of Capt. A. Courtenay Snow, R.A.F., only son of Mr. and Mrs. John Snow, Penllwyn Park, Carmarthen, and Dorothy Elizabeth Bligh, youngest daughter of Mrs. Livesay, Eaglehurst, Alverstoke, Hants.

MARRIAGES.

ALDERSON—DOIG.—On Aug. 18th, at Swanage, Lieut. A. G. D. Alderson, R.A.F., son of the Rev. A. D. Alderson, of Tockwith, York, was married to Edith Mary, eldest daughter of Mr. David Doig, of Rosslyn House, New Barnet.

DICK—MARSH.—On Sept. 6th, at All Souls' Church, Loudoun Road, N.W., by the Rev. W. P. Hanks, M.A., D.D., Walter Fleming Dick, late Lieut., R.A.F., only surviving son of Mr. and Mrs. John Semple Dick, of 34, Langham Road, N., and grandson of the late Anthony Beaufort Brabazon, M.D., of Bath, to Marjorie Stella, widow of Harry Evelyn Marsh, of Sheffield, and youngest daughter of the late Edward Nunes Phillips.

FOSTER—HATCH.—The marriage took place on Sept. 2nd at St. Mark's, North Audley Street, of Capt. William Foster, R.A.F., youngest son of Mr. Robert Foster, of Stockeld Park, Wetherby, Yorkshire, and the late Hon. Mrs. Robert Foster, and Marjorie, only child of Sir Ernest Hatch, formerly M.P. for the Gorton Division, and Lady Constance Hatch, of 46, Upper Grosvenor Street, W.

The officiating clergy were the Dean of Salisbury (Dr. Page Roberts), great-uncle of the bride, the Rev. the Hon. A. Parker, uncle of the bridegroom, and the Rev. W. G. Pennyman, vicar of St. Mark's.

NIGHTINGALE—WHITAKER.—On Sept. 1st, at St. Anselm's Church, Streatham, by the Rev. F. A. S. Reid, M.A., Capt. Alfred J. Nightingale, R.A.F., youngest son of the late A. Nightingale, to Stella May, youngest child of the late Walter S. Whitaker and Mrs. Whitaker, Streatham.

ROACH—COOK.—On Aug. 25th, at Christ Church, Ealing, Lieut. Thomas Edward Vaughan Roach, R.A.F., of Johannesburg, South Africa, was married to Elspet Sophia, only daughter of Mr. and Mrs. John Nicol Cook, 27, Castle Bar Road, Ealing, and Aberdeen, by the Rev. J. E. Cardigan Williams

SOMERS-MARSHALL—NEALE.—On July 22nd, at St. Mary Magdalen's, Brighton, Lieut. J. A. Somers-Marshall (late R.A.F.), was married to Winefride Mary Neale.

SYKES—ROBERTS.—On Sept. 4th, at St. Jude's on the Hill, Golder's Green, Capt. Maurice Gaskell Sykes, R.A.F. (Indian Civil Service), youngest son of T. Gaskell Sykes, West Ealing, to Constance Mary Lilian, younger daughter of the late Hugh Stewart Roberts.

WOODHOUSE—MANNING.—On Sept. 1st, at All Saints' Church, Nottingham, Lieut. George Edward Leighton Woodhouse, R.A.F., younger son of Mr. and Mrs. Arthur Woodhouse, of 17, Heygate Avenue, Southend, to Mary, only daughter of Smith Fowler Manning, Esq., J.P., and Mrs. Manning, of The Tower House, Nottingham.

BIRTHS.

ALSTON.—On Aug. 23rd, at Dyffryn, Dulwich, S.E., to Margery, wife of Capt. C. R. Alston, late R.A.F.—a daughter.

ELLIOTT SMITH.—On Aug. 18th, at "The Rough," Wimborne Avenue, Parkstone, the wife of Capt. H. Elliott Smith, R.A.F., of a son.

ELLIS.—On Sept. 1st, at "Glasslyn," Brook Street, Brentwood, Essex, the wife of Colonel H. C. Ellis, C.B.E., R.A.F., of a son.

MONTAGU.—On July 19th, at Lady Holland's Home, to Capt. A. M. R. Montagu, R.A.F., and his wife Margaret (née Rumsby), a son—John Humphrey.

MUSSON.—On July 24th, at 3, St. Andrew's Road, W.14, to Moya, the wife of Lieut. J. McD. Musson, R.A.F.,—a son.

O'CONNOR.—On Aug. 13th, at 34, Albert Road, Regent's Park, N.W., Constance (née Price), the wife of Capt. C. W. O'Connor, R.A.F., a son.

OLDHAM.—At Balgonie, Cobblehill, Vancouver Island, the wife of Lieut.-Col. Frank T. Oldham, R.A.F., of a son.

SANDFORD-THOMPSON.—On August 10th, at Orchard Cottage, Dormansland, Surrey, the wife of Major W. A. Cecil Sandford-Thompson, late R.A.F., of a daughter.

SCOTT.—On July 8th, at Wyncot, Thorpe St. Andrew, Norwich, to G. J. Scott (late Captain, R.A.F.) and Mrs. Scott, a daughter.

SLINGSBY.—On Aug. 5th, at "Clare Green," Nelson, Lancashire, the wife of Capt. William Ecroyd Slingsby, R.A.F., of a son.

WOOD.—On Sept. 5th, 1919, at Thicket Cottage, The Thicket, Southsea, "Biddy" (née Amos), wife of Capt. H. L. Wood, R.A.F., of a daughter.

ON THE SCHNEIDER PICNIC.

[NOTE.—Owing to the extreme length of these notes it has been necessary to set them in small type. It is hoped that the information contained therein will repay the trouble of reading them.—C. G. G.]

Officially it was called the Jacques Schneider International Cup Seaplane Competition, or words to that effect, the function of Sept. 10th having been arranged in order to hold a seaplane race for a handsome trophy and a prize of £1,000 presented by M. Jacques Schneider, of the famous French gun-making firm. Unfortunately, owing to a variety of reasons which will be related in detail further on in this story, there were very few seaplanes, there was no race, and there was little or no competition.

Consequently, the grandiloquent and complicated official title did not apply, and, considered from that point of view, the affair was a very perfect failure. But, considered as a picnic pure and simple, it was a great success, at any rate to those of us who had the good fortune to be of the party on the T.S.Y. "Ombra," which the Committee of the Royal Aero Club had borrowed from Mr. Montague Grahame-White for the occasion. Perhaps the expectant hundreds of thousands of the mere public who sat and grilled on the cliffs and beaches between Christchurch and Swanage enjoyed themselves less, and departed with a very poor opinion of seaplanes and the sport of flying, but, after all, that is no concern of the Royal Aero Club, which, it will be remembered, is by agreement with the Aerial League and the Royal Aeronautical Society concerned only with the sporting side of aviation and not with propaganda or with science.

AN EPICUREAN EPITHALAMIUM.

Certain readers of this paper have made the accusation that one is constantly attacking everything and everybody, and that one is incapable of praise. Just by way of refuting that accusation one feels that it is one's first duty to praise the Committee of the R.Ae.C. for its work on Sept. 10th and during the period of preparation before that date. Those who are merely interested in seaplanes and flying and such things had therefore better skip the next few paragraphs, for the ensuing epithalamic effort has nothing to do with such subjects. But one must praise something.

The Committee of the Royal Aero Club may not be great as organisers of flying events, but it certainly is astonishingly competent in arranging for the social side of the sport of aviation. It is true that once in a while it misses an opportunity—as, for instance, when it omitted to entertain the first people to fly the Atlantic, namely the gallant officers and men of the U.S. Naval Flying Boat N.C.4—but it made full amends to its members in the way it afforded them the opportunity of eating and drinking with Sir John Alcock and Sir Arthur Brown, and with the officers and men of H.M. Airship R.34.

The Committee may not arrange "classic" races, nor establish championships for different kinds of sporting events in its own line, as do the governing bodies of other branches of sport, but it has certainly appeased the hunger and thirst of its members better than has any club in London throughout the war and the subsequent parched and arid peace. This signal success is certainly due to the individual genius of the Club's *maître d'hôtel*, Mr. Frisbee, whose ability in finding manna in the wilderness and in extracting liquids (other than water) from the rocky hearts of dealers in such commodities suggests that somewhere in his remote ancestry he must include the Quartermaster-General of Moses' Desert Column. But to the Committee belongs the credit of having discovered and engaged Mr. Frisbee and the still greater credit of succeeding in retaining his services.

A YACHTING PICNIC.

By a wonderful flash of intelligence the Committee sent Mr. Frisbee to control the catering on the yacht "Ombra," with the result that one hundred and seventy people had excellent lunches in relays in a saloon which could only seat twenty at a time. And then they had tea and an infinite variety of *patisseries* afterwards. Where the material was stowed and how it was handled was a pure conjuring trick.

It was not surprising that one of the distinguished foreign visitors who had some knowledge of the Club, as well as of "Ombra" during the picnic, remarked that though the Schneider Cup Race was not a success the Committee was quite fit to run a subsidiary company of the Maison Lyons.

At any rate, all those who penetrated to the yacht enjoyed the picnic thoroughly, though one cannot speak for the balance who stood on the pierhead at Bournemouth. Personally, one cannot praise the work of the Committee too highly.

OUR VISITORS.

In the preceding issues of this paper Capt. Sayers has given all obtainable particulars concerning the competing machines and the so-called eliminatory trials from which the British team was selected, but, as usual, some of the competitors only arrived at the last moment.

It was unfortunate in some ways that there were so few entrants, though, as things turned out, it was fortunate that there were no more nations represented, for if there had been there would have been just so many more to be amused, or annoyed, or irritated by our comic British ideas of organisation. If, for example, there had been a German team we should have provided aviatic Germany with subject-matter for

THE HERO OF THE DAY.—The Italian Pilot, Janello, in his Savoia Boat (250 h.p. Isotta-Fraschini engine) at Bournemouth.

heavy humour for the next two or three years. As it was, the French and Italians took our clumsy efforts with all the courtesy of the Latin race, whatever they may have felt, and it is only right to put on record the names of our visitors on this occasion.

The Nieuport firm was represented by M. Delage (Director), M. Chasseriaux (Chief Engineer), Lieut. Casale (Pilot), and MM. Janvier, Arnould, Sanson, Bompaire, Fournier, and Bonthieu.

The Spad was represented by M. Herbemont (Technical Director and Chief Designer), M. Sadi-Lecointe (Chief Pilot), M. de Romanet (Reserve Pilot), and MM. Chion, Levannier, Lehoucq, Fabricius, Coquelin, and Maignan.

The Savoia was represented by Sig. Santoni (Director, and incidentally a pioneer of British aviation), Mr. Power (British Representative), Sig. Janello (Pilot), Sig. Conflenti (Technical Manager), and Signori Magnani, Aisa, Roncorone, and Foresti.

M. Rousseau, of the Paris "Temps," was the French *commissaire*, and Capt. Finzi, of the Italian Army, a Doctor of Science, and Air Attaché at the Italian Embassy, watched affairs in the Italian interests. M. Demonge and M. Roche d'Estrez, of that excellent new French paper "L'Air," were also present. And a distinguished visitor was Madame Lumière, the clever little lady who has designed and manufactured the airscrews which have captured all the recent records in France.

BEFORE THE FATAL DAY.

One arrived on Tuesday at Cowes where the foreign competitors were housed in the capacious sheds of S. E. Saunders, Ltd. Certainly nothing finer could be imagined as a storage place for seaplanes, and nothing could exceed the care which Mr. Sam Saunders took to provide for the needs of the visitors. Lieut.-Commander Harold Perrin (Secretary of the Royal Aero Club) busied himself indefatigably for their comfort, and Mr. Charles Greenhill expended his Pentecostal versatility for their verbal assistance. Indubitably they had nothing of which to complain before the fatal day on which the competition should have occurred.

The Nieuport people had the hardest of luck, which was only relieved by the splendid example of sportsmanship it afforded. M. Casale had left Paris on Sunday and had arrived at Cowes *via* Brighton in two and a half hours, a very fine performance. In descending at Cowes he alighted on top of a buoy and completely abolished his floats and undercarriage. The machine sank, and of course that meant that the wings and engine were seriously damaged, though fortunately the main spars were not broken.

Real Sportsmanship.

As soon as his men arrived on Monday morning Mr. Saunders set them to work to rebuild the Nieuport. Mr. Newman took charge of the job and he and his men worked without stopping till Wednesday morning, so that the machine was ready again in time for the race. They fitted the spare engine and the spare floats which the Nieuport people had sent on ahead; they rebuilt the wings entirely, using only the spars, metal fittings, compression struts, and a few ribs; they made new undercarriage struts; they repaired the fuselage and tail unit; and they re-erected the whole machine.

In defiance of all modern labour notions they worked for practically forty-eight hours at a stretch, and demonstrated conclusively that, whatever the British workman may be, he is at heart a sportsman. The work was excellently done, and all the foreign visitors were loud in praise of the fine spirit shown by Mr. Newman and his men. It is wholly lamentable that their fine sporting effort was wasted after all, but it was a very bright spot in a disappointing affair.

More Bad Luck.

The Nieuport bad luck did not end here. M. Malard, the famous pilot of pre-war days, left Paris on Monday on the second Nieuport, and disappeared. The Air Ministry put a telephone call through to Paris on Tuesday, but could get no news of him. On Tuesday evening a member of the Royal Aero Club at Cowes tried to telephone to the Admiralty to awaken it to the advisability of sending a destroyer or something to hunt for him, but so far as one could learn nothing came of the attempt.

It was not until the centre of activity had moved to Bournemouth on Wednesday that information was received that M. Malard had been picked up in mid-Channel some time the previous day. He owes his life to the perfect weather of the period. Otherwise, he must have suffered the fate of poor Gustav Hamel, drowned in flying from France for the Aerial Derby of 1914.

Final Alterations.

The Spad arrived by boat and was duly assembled. After a preliminary trial M. Herbemont decided that she would be faster with less surface, so he and his men spent Tuesday night in amputating a foot or so from each tip of the upper plane. The result was that she arrived at Bournemouth with her upper wings considerably shorter than her lower.

The effect was curious to the eye, but distinctly beneficial to her speed, and though she was obviously not as fast as the Sopwith, she would have put up a good fight for second place with any of the other competitors. Despite her quaint appearance, she impressed everybody very favourably, and it is to be hoped that she will do some trials against time before long so that her performance may become known.

A Fine Achievement.

The Savoia was the last competitor to arrive, she came the longest distance, she was certainly built in the shortest time, and she was the first of the visitors to fly after arrival. All of which is cause for just pride on the part of her constructors.

Three weeks before the event she did not exist. She was built in exactly two weeks, and she spent a week in reaching England. She would hardly have got there then but for the help of General Pitcher and the Air Ministry Mission in Paris, who used every endeavour to expedite her railway journey across France.

She had the smallest engine of all the competitors, a 250 h.p. Isotta-Fraschini, but it has a lovely voice and it runs like a clock. The boat and wing structure is beautifully built, and altogether Sig. Conflenti is to be congratulated on a very fine achievement.

Sig. Lorenzo Santoni, who will be remembered as being concerned with the British Deperdussin Co. and with the General Aeronautical Co. of 1912 and thereabouts, has certainly made good in Italy as founder and director of the great Savoia firm. It is seldom that such a pioneer as he attains to so much success.

The British Competitors.

Of the British competitors, all of whom were housed in their own sheds on Southampton Water, it suffices to say that the Sopwith with the 450 h.p. Cosmos-"Jupiter" was an obvious choice because of her astounding speed, which must be a good 160 miles an hour, if not more. The Fairey with the 450 h.p. Napier-"Lion" was an equally obvious choice as a machine of high speed and of proved seaworthiness. With these two Great Britain was estimated to be well represented in case of either very fine or very rough weather. The choice between the Supermarine with the 450 h.p. Napier and the Avro with the 240 h.p. Siddeley-"Puma," B.H.P., was not so obvious, for the Avro was apparently the faster until the day of the race, when the Supermarine acquired a new airscrew and gained a good five knots in speed.

The Committee of the Royal Aero Club made a mistake in holding "Eliminating Trials" at all. They should have held simply "Trials," and after noting carefully the speed and

performance of each machine they should have nominated the representative machines on the day of the race. As it turned out, if the Avro had been nominated she would probably have won, for she was faster than the Savoia.

A SUGGESTION TO THE R.Ae.C.

If the Committee wants to justify its existence it has a chance of doing so. There is a great deal of dissatisfaction about its choice in the Schneider affair, so it would confer a benefit on everybody if it would arrange a "British Seaplane Championship" to be held during the inevitable fine spell in October commonly called "St. Martin's Summer."

The course should be from Southampton Pier to Calshot as many times as might be necessary. The Club Enclosure, starting and finishing point should be in the Avro Aerodrome at Hamble. The rules should be otherwise those applying to the Schneider Cup Race.

The date might be fixed approximately and forty-eight hours' notice given of the actual start, when the Air Ministry Meteorological Department signals fine weather ahead.

In this way British constructors might satisfy themselves and demonstrate to the world who builds the best seaplanes. And if the Club wanted to be really enterprising it might offer a respectable prize for foreign competitors. Thus it might remove some of the obloquy which at present attaches to it on account of its apathy towards the sport of flying and its dire demonstration of organising inability.

THE DAY OF THE FIASCO.

The Club yacht arrived at Bournemouth a little after midday on Wednesday. There had been a fog in the Solent in the morning, but by mid-day the sky was clear except for a slight haze. There was scarcely a breath of wind, the sea was dead calm except for a slight swell, and it was blazing hot. In fact it was a perfect day. And that was precisely why the whole affair was such a hopeless fiasco.

If it had been blowing a gale nobody would have been surprised at machines smashing up, or at the race being called off, but on such a day the public in its hundreds of thousands expected to see a great race, and it was grievously disappointed.

A WILY COMPETITOR.

The first competitor to arrive, if one is not mistaken, was the Fairey, piloted by Lieut.-Col. Vincent Nichol, D.S.O. Mr. Dick Fairey is one of the wisest and wiliest of men, besides being a genius as a designer. He saw no fun in keeping his machine afloat till the Committee felt inclined to start the race. Keeping afloat means the danger of being rammed by motor-boat hogs or idiots in other craft, besides a great deal of trouble generally. So he arranged to beach his machine as soon as it arrived.

Mr. Fairey argues that the whole fabric of British society is based on the Land Laws, and that if a man puts up an enclosure of any sort it takes an Act of Parliament to shift it. One may tell off innumerable officials and policemen and so forth to keep a crowd back, and the crowd will still push past them. But if one sticks a few posts into the ground and ties a piece of cotton between them the crowd will respect the sanctity of the resultant enclosure.

So Mr. Fairey constructed a wire fence with many posts and much wire, rolled it into a bundle, and sent it to Bournemouth with men in a lorry. As soon as Colonel Nichol beached the machine—right alongside the pier—the Fairey gang came down, unrolled their fence, stuck the posts in the sand, and there the machine remained, perfectly happy and unmolested.

The contrast between the fenced Fairey and the unfenced Savoia may be seen in the accompanying photographs. There is a useful lesson here, both for the Club Committee and for individual aeroplane owners.

PRELIMINARY INCIDENTS AND ACCIDENTS.

The Supermarine boat arrived much about the same time as the Fairey, and Squadron-Commander Hobbs, D.S.O., the pilot, made a faultless alighting. He was promptly taken in tow by the Supermarine Co.'s funny little motor-boat "Tiddleywinks." This, one is told, is really the hull of one of the original Supermarine flying-boats built for that clever and curiously neglected invention of Mr. Pemberton Billing's by which the wings and tail form a complete unit which can be slipped off, leaving the hull as a self-contained motor-boat. Such a scheme would have been of great value during the war, and will be later on when flying-boats come into their own.

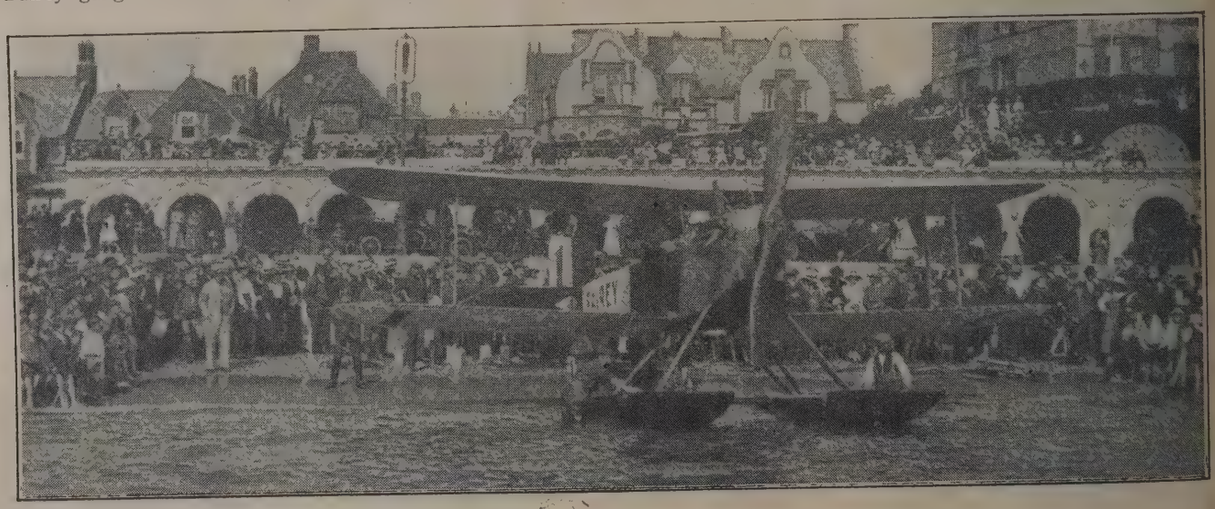
"Tiddleywinks" was very useful all day, acting as tender for all and sundry. A photograph shows her courteously assisting the Spad after the arrival of M. Sadi-Lecointe.

Mr. Hawker arrived soon after on the Sopwith, the big "Jupiter" engine emitting much crackling owing to being throttled down, though it has a splendid note when running full bore. He alighted well and beached his machine. Afterwards one learned that he discovered a leak in a float, so the pair of floats was changed on the beach while waiting for the race to start.

THE RESULT OF A PERFECT DAY.

This was the first evil result of the perfect weather. As there was no wind all the machines had perforce to alight at their slowest safe flying speed. In the case of the Sopwith this could hardly be less than 60 miles an hour, for a speed range of 60 to 160 m.p.h. is about as wide as could reasonably be expected.

Also, as there was no wind the sea was as smooth and as hard as glass, whereas if there had been a slight ripple or lop the floats would have cut through the tops of the waves, which would thus have had a gradual braking effect. Consequently, floats which would have done their work perfectly well on an ordinary day simply cracked through hitting hard, smooth water at a very high speed.



THE ARRIVAL OF THE FOREIGNERS.

The first of the foreign machines to alight was the Savoia. Janello put her down in perfect style. He is a fair-haired, blue-eyed youngster, very much more a Goth than a Latin in type, and he is a non-commissioned officer of the Italian Navy. As he has three rows of medal ribbons one judges that his Service record is more than ordinarily good. And his flying showed him to be a pilot of the very first class.

When he alighted one noticed the first serious defect in the Aero Club's organisation. He taxied about on the water for quite a while before anybody paid any official attention to him. At last he was taken in tow by a big, clumsy R.A.F. boat, the crew of which was evidently unaccustomed to handling small flying-boats. However, they managed not to do any damage to the machine, and eventually he put his boat ashore.

DEFECTIVE ORGANISATION.

One would have expected that there would have been a motor-boat told off as a tender for each competitor, and that each such boat would have borne the competitor's numbe

A PSYCHOLOGICAL STUDY.—How the British Public respected the Fairey Company's fence.

Then there could be no doubt about whose duty it was to attend to whom.

Later, when the Spad alighted (in very pretty style), she was towed in by the Supermarine Co.'s "Tiddleywinks." She also was beached, for lack of proper moorings, and stove a hole in one of her floats on a stone on the beach. So that put her out of the race.

It was desperately hard luck on M. Herbemont, who was so upset by the accident and so overwrought by working nearly all night at cutting down his wing area that in the evening he quite broke down and was too *enervé* even to eat or drink. As a designer he is quite in the front rank, so there was no need for him to be discouraged, but apparently he had set his heart on making a good show in this race, so he took things rather more hardly than seemed necessary.

Last of all came the Nieuport, flying very fast and evidently standing a very good chance in the race if anything happened to the Sopwith. M. Casale put her on the water as slowly as was possible with so fast a machine, and floated about for a while. Then she began to sink slowly, and on beaching her it was found that a float had cracked in alighting. This, again, was the fault of the perfect weather and not of the Club.

The Float Trouble.

It is well to remember, and to point out to those who scoff at seaplanes on the strength of the Schneider fiasco, that these floats which cracked and burst and punctured so easily were built specially light purely for racing machines, and were intended for ordinary weather. When they had to come down on glass-hard water at high speed, or be pushed ashore on pebbles, they were asked to do something which they were never intended to do.

All the firms whose machines suffered in this way have built excellent floats in the past. These breakdowns reflect no more discredit on the firms than does the breakdown of an experimental racing car of a motor firm of proved reliability.

More Defective Organisation.

When the foreign pilots went ashore they found that there were no preparations of any kind for them. There was nobody to interpret for them. There was nobody to keep the mob away from their machines. There were no preparations to feed them, though even if the race had started at the proper time (2.30 p.m.) they would have wanted lunch.

So far as one could discover, they were supposed to hang onto the tail of a motor-boat (if they could find one) from the time of their arrival until the start, and they were to feed in their machines as best they could. Which hardly strikes one as being the courteous or even the politic way in which a big and rich club ought to treat visitors from abroad.

Happily, the undefeatable Mr. Newman of S. E. Saunders, Ltd., redeemed our national reputation when he discovered that the Club had made no preparations. Somehow he managed to make himself understood by both the French and Italians. He found food for them, he established some sort of guard for their machines, he commandeered planks with which he made temporary launching slips. He and the crew of his Saunders seaplane tender were here, there, and everywhere.

No wonder the visitors went home with the idea that Saunders, Ltd., and their Mr. Newman, are the most efficient people and the best sportsmen in England. They saw so little of the Committee of the Royal Aero Club that they can scarcely have acquired a true estimate of either their efficiency or sportsmanship.

A Geographical Error.

The splendid work done by Mr. Saunders and his people is in fact the one redeeming feature in the result of the Committee's gross error in choosing Bournemouth as the headquarters of the race and Cowes as the storing-place for the machines.

The theory was that if the day was rough the machines would fly off the sheltered water at Cowes, alight on the water at Bournemouth, and then start in the race when told. If that had actually happened most of the machines would have been wrecked or swamped long before the race started. Moreover, there was no direct communication with Cowes, so there was no way of telling them when to start for Bournemouth.

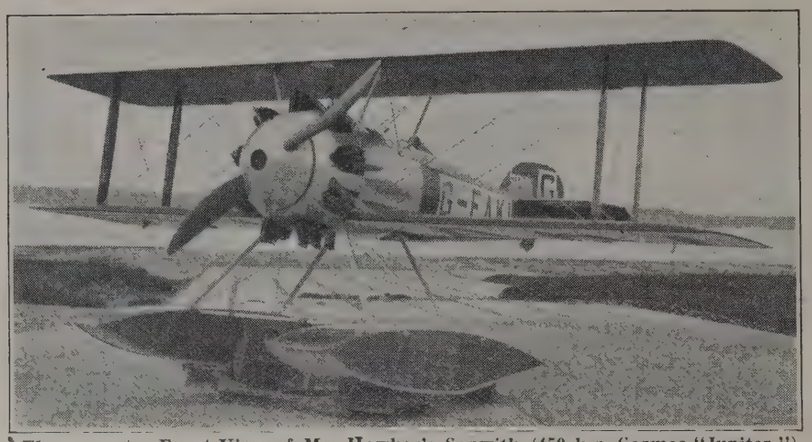
When the Aero Club first announced that the race was to take place this year, one pointed out the folly of separating the housing of the machines from the starting-point of the race. Events have shown conclusively that one's criticism was right.

The race ought to have taken place at Eastbourne, where there are seaplane sheds and ample repair shops within flag-wagging distance of the pierhead which would be the timing point. If the sea had been too rough at Eastbourne it would have been too rough at Bournemouth also. From every point of view Eastbourne would have been a far better place for a race which, under the conditions of the prize, must be held in the open sea. Otherwise, the Solent or Southampton Water is the right place.

Nothing but Mr. Sam Saunders and his people saved the face of the Committee, and, without detracting in any way from their magnificent effort, one may express one's belief that under similar circumstances Major F. B. Fowler and the Eastbourne Aviation Company would have been just as thoroughly sportsmanlike.

It is to be hoped that before another important event takes place the Royal Aero Club will have formed a committee to manage that event which will include men with a stronger critical faculty, greater knowledge of sporting flying, and more experience of organising competitions than those who were responsible for the Schneider fiasco.

THE RACE THAT FAILED.



Not long before the race was timed to start heavy banks of fog began to roll in from seaward, and by 2.30 p.m. one could only see about 400 yards in any direction, and then only up to a height of 40 or 50 feet. From the yacht everything was blotted out except the pier and the beach immediately behind it.

Before the fog came in two R.A.F. boats had gone off, one to the turning-point at Swanage and one to the turning-point at Christchurch. A third boat of the same type was kindly lent for the race, but was not wanted. But that is another story which enters into this tale later.

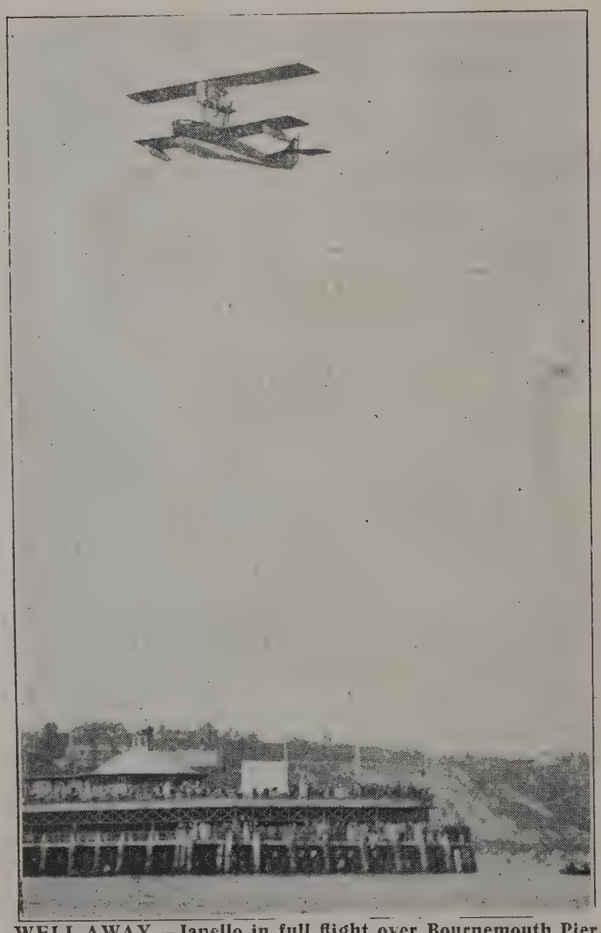
By 4 p.m. the fog had passed inland and left only a slight heat-haze through which it was quite possible to see the Needles—the westernmost point of the Isle of Wight. Therefore the Committee decided to start the race at

HOW NOT TO DO IT.—The Savoia swamped by the crowd owing to the lack of an official enclosure.

Three-quarter Front View of Mr. Hawker's Sopwith (450 h.p. Cosmos "Jupiter.")

4.45 p.m., without taking the precaution to send a machine down the long leg of the course to Swanage to see what the weather was like there.

This proved to be the undoing of the whole affair. Capt. Hammersley and the little Avro (the British reserve machine) had been doing some very pretty exhibition flights during the morning, and he would certainly have gone out scouting if the Committee had asked him to do so. But seemingly nobody thought of it, and the race started.



THE START.

The first machine away was the Fairey which lifted in great style. Colonel Nichol, who knows the coast well, reached Swanage Bay and found it still full of fog. Though he could see the top of the cliffs he could see nothing below them. Relying on his own quickness in controlling the machine, he dived into the fog to try and find the mark-boat. He sighted the water and flew along about 15 feet above it. Then suddenly a sailing ship appeared in front of him. He pulled his machine upwards as quickly as possible, cleared the ship, and went straight on up into the clear air.

Then he headed for Bournemouth, circled round to find a vacant piece of water, alighted on it, and beached his machine. He reported to Mr. Fairey that it was not good enough to go on with the race, for if he could not see the mark-boat he was sure that the mark-boat could not see him. Though it might hear him if he followed the cliff line, that would not be evidence of identity. Consequently he retired from the race. The Fairey people took his decision without question, for they knew that their machine was not up to

Three-quarter Rear View of the Sopwith.

WELL AWAY.—Janello in full flight over Bournemouth Pier.

the speed of some of the others, so they simply withdrew from the race.

They had been gambling on and praying for fairly rough weather, and it turned out to be a perfect day. If it had blown half a gale they would very probably have won. The curious thing was that after all the Fairey was the only competing machine that flew home.

Commander Hobbs' Supermarine was the next starter. He took her off splendidly, though badly baulked by row-boats which came out onto the course owing to absence of course-keepers. This is another point for the attention of the Committee at the next seaplane competition.

Personally, one's idea of a course-clearing craft is a 40-knot steel-built hydroplane with a ram bow, but, as such a method might not find favour in so mild-mannered a country as this, perhaps a fast hydroplane with a big megaphone or a Klaxon might suffice. On Wednesday there seemed to be nobody to keep the course clear. Mr. Louis Coatalen in "Tyreless" was doing some very neat high-speed driving, and one feels sure that if he had been asked he would have been pleased to act as course-keeper.

A wrong impression has been circulated concerning the fate of the Supermarine. All that was seen of her was what looked like a circuit of the course. She came down at the end of the first lap to do the two alightings specified by the conditions, and at the first attempt changed at once from a Supermarine to a submarine. Naturally the uninformed assumed that the hard, smooth water had stove in her bottom.

Such was not the case at all. She was also a victim of the perfect day, but not from that cause. What happened was this: Commander Hobbs arrived at Swanage Bay, could not see the mark-boat because of the fog, and so alighted in the hopes of finding her under the fog-bank. As he failed to do so, he, being an experienced seaplane pilot, took a compass-bearing for Bournemouth and started away again. Just as he was leaving the water something hit the boat with a terrific crash, but being already practically in the air he carried on: which was extremely lucky for him, as it proved.

Once out of the fog-bank he headed for Bournemouth, turned over the pier and went back to Swanage. This time he flew round the Bay, taking his course by the cliffs, presumably hoping that the mark-boat would see him even if he could not see it. Thence he followed the proper course to Christchurch, turned there, and came down to do the

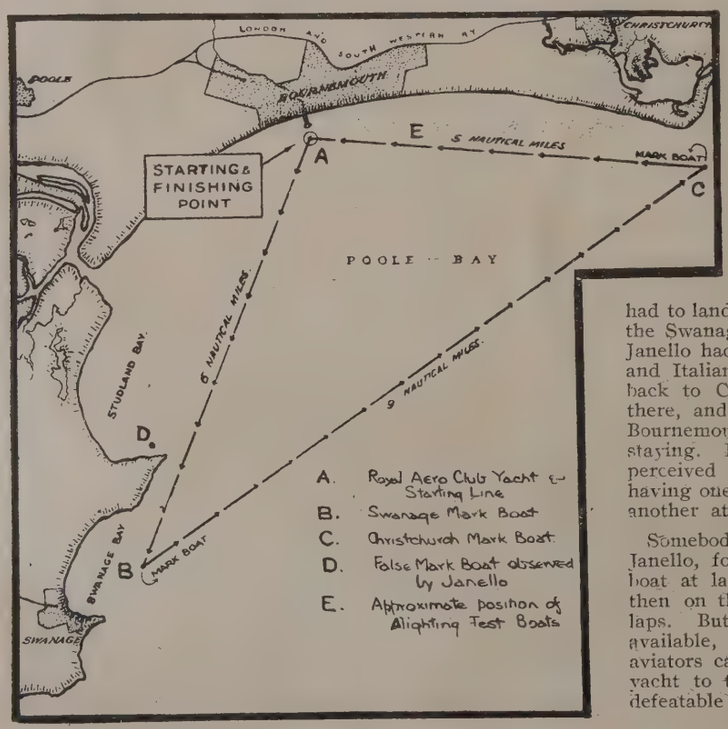
The Supermarine (450 h.p. Napier "Lion"), piloted by Squadron-Commander Hobbs, D.S.O.



required alightings under the eyes of the official observers on a Naval "M.L."

Surmising that there was probably something wrong with his boat he alighted very carefully and very close to the "M.L." He made quite a pretty descent onto the water and went straight under. He himself came up a few seconds later and was retrieved by the ubiquitous "Tiddleywinks," which had gone down to watch his alighting. When the boat was hauled up later on it was found that the whole bottom had been knocked out of her by the collision at Swanage. Presumably the object hit was a baulk of timber or a big packing-case which was invisible owing to the fog and smooth sea. There were several R.N. ships in Swanage Bay at the time, and the Navy is always prodigal with such impedimenta, and is accustomed to heave overboard anything, no matter how useful, which interferes with superficial smartness.

The next to get away was the Savoia. Janello's start was perfect as an example of handling a boat, but here again was an example of mismanagement by the Committee. He taxied towards the line, looking alternately at the pier and at the yacht for the starting signal. The official starter and the timekeepers were in fact on a "M.L." ahead of the yacht, though there was nothing to indicate the fact, and apparently nobody had informed the foreign competitors.

The obviously proper method of starting such a race is by means of a big white flag hung out on a pole from the pierhead and used exactly as an ordinary semaphore signal is used on a railway. It is so hard to get people, especially official people, to see that the simplest method is always the best

MAP OF COURSE.

Anyhow, inspired apparently by everybody on the yacht waving him forward, Janello got off, followed the coast in the direction of Poole, appeared presently to the southward flying east, came back over Christchurch way, made his two required alightings in quite perfect style, and thereafter continued to pass the post lap after lap with the regularity of a clock. One will leave him at that for the time being.

The fourth and last starter was Mr. Hawker on the Sopwith. He got off the water faultlessly and streaked off towards Swanage with that curious hustling action reminiscent of a scalded cat which one always perceives in the start of these tiny machines with big engines. In an incredibly short time he came back, alighted close to the beach where he had gone ashore earlier in the day, heeled over to the right, opened up his engine, skilfully avoided sundry bathers, and shot his machine onto the sand.

Later one learned that he had gone to Swanage and, like Colonel Nichol, had found it impossible to see the mark-boat, so he had decided to withdraw. On alighting he had punctured another float. So that was that. He was a double victim of the perfect day.

The Great Tragedy.

We may now revert our attention to Janello in the Savoia, who, after all these minor tragedies, was left circling a course in solitary glory. It had been arranged that, as the required alightings in the first lap necessarily took a good deal of time, competitors could, if they wished, fly eleven laps instead of ten and be officially timed for the last ten so as to set up a seaplane record for 200 nautical miles. This Janello elected to do.

Somewhere about the ninth lap Mr. T. O. M. Sopwith, who is an exceptionally fine judge of pace and had been studying the times very carefully, perceived that Janello's time for each lap—though wonderfully regular—was much faster than was possible for the apparent speed of his boat. That was the first hint that there was a still greater misfortune in store for the unfortunate Aero Club than the previous mishaps.

Janello duly completed his eleven laps, but as there was one lap which was so fast as to show that he must have turned short somewhere, Sig. Santoni went out in a motor-boat and, when Janello alighted, asked him to go on again for a twelfth lap so as to be sure of covering the full course. Janello consented, although he said that he doubted whether he had enough petrol for the distance, and this led to still more trouble.

A Wholesale Mix-Up.

Judging by his previous laps Janello should have come round again in about ten minutes. Twenty minutes, thirty minutes, and then forty minutes passed, and there was no Janello. The Christchurch mark-boat returned and reported that he had passed it ten times, but not eleven, thus proving that the short lap, already surmised from the time-sheets, had been made.

Still there was no Janello, and it was evident that he had come down somewhere at sea. Darkness was falling, the yacht "Ombra" had to get back to Cowes for fear of being fog-bound on the way up the Solent. The Aero Club Committee had to land on the pier at Bournemouth to await the arrival of the Swanage mark-boat, on whose report depended whether Janello had covered the correct course or not. The French and Italian *commissaires* and some others of us had to get back to Cowes in "Ombra," for all our belongings were there, and in any case there was not a room to be had in Bournemouth, and we could not help Janello in any way by staying. It was a horribly helpless feeling. But thus one perceived the true beauty of the Committee's scheme of having one headquarters at Cowes, another on the yacht, and another at Bournemouth.

Somebody ought to have gone off at once in search of Janello, for although there were an M.L. and an R.A.F. boat at large patrolling the course, both were probably by then on their way home, having counted the requisite ten laps. But there did not seem to be a boat of any kind available, and anyhow everybody appeared to be in what aviators call a flat spin over the job of shifting from the yacht to the pier and so forth. Then, as before, the undefeatable Mr. Newman and the Saunders launch came to

First London to Madrid non-stop Flight

B T-H

the rescue and took off Sig. Santoni, Sig. Conflenti, and Captain Finzi, to go in search of Janello.

As "Ombra" started for Cowes one looked round the horizon, which was now quite clear, and in the dying reflection of the sun on the water over towards Poole one spotted through glasses a slow motor-boat towing a flying-boat. Careful study showed clearly that the latter was the Savoia, for there was nothing else in this part of the world with precisely her hull-line. So we went off to Cowes greatly relieved in mind.

Front View of the Savoia off Bournemouth Pier.

A Reunion and a Blow.

The first people one met on entering the Gloster Hotel at Cowes were the Savoia crowd, Signori Santoni and Conflenti, Captain Finzi, and the lost Janello, with the inevitable Mr. Newman. It appeared that, despairing of other help, they decided to fling themselves on the mercy of the Royal Navy, and had gone aboard H.M.S. "Malaya," then lying off Bournemouth with H.M.S. "Barham," for the enthusement of the British public. "Malaya" could do nothing without the consent of her flagship "Barham." Just as they were going over the side to appeal to "Barham" the keen eye of Sig. Conflenti caught sight of the motor-boat towing the flying-boat and recognised the towee. So the Italians, instead of waiting for the British Navy to move, depended on the Mercantile Marine (like the British nation in the Great War), and went off again in the Saunders boat.

They found Janello, put the Savoia safely onto the beach, and came straight back to Cowes. As the Saunders boat does her 16 knots comfortably they got in before "Ombra" and were celebrating their success when the rest of us arrived.

Moved by that "'satiable curiosity" which one shares with Mr. Kipling's baby elephant, one thereupon put a telephone call through to the Branksome Towers Hotel at Bournemouth, which had become the fourth home of the Aero Club's mobile headquarters. Then one learned what one rather expected—namely, that the Swanage mark-boat had never seen Janello at all. They had only seen one machine for one moment in all the day, and were not very sure what it was, but they thought it was the Fairey—which was probably when Colonel Nichol nearly hit a boat of some sort. The mark-boat heard engines in the direction of Studland Bay, and that was all.

Signor Santoni took over the telephone and got the same information, and broke it gently to Janello and the others. Naturally they were dumbfounded. Janello, a skilled pilot and a sailor by training, stuck out firmly that he saw the mark-boat quite clearly, that it was just like the one at Christchurch, and that he passed well outside it every time. He was not likely to be mistaken.

An Explanation and a New Mystery.

Then one produced an official programme, in which was a map of the course, and Sig. Santoni asked Janello to indicate the position of the mark-boat. Without hesitation he placed his finger on a point in Studland Bay, just north of the headland which divides Studland from Swanage Bay. That explained at once the mystery of the excessively fast times. But it produced a new mystery—namely, what boat could possibly have been there?

The only possible explanations at the time seemed to be either that it was an unemployed M.L., or else that it was the third R.A.F. boat which had come out to act as a mark-boat and was not wanted. At the moment of writing the mystery still remains unsolved.

It is, however, plain that Janello would not fly eleven laps of a wrong course just for fun. What happened evidently was that, following the coast past Poole, he came in due course round Studland Bay. Either he could not see over into Swanage Bay because of the fog and never knew that such a place existed, or else, seeing that the coast south of Studland was full of fog, he saw the bogus mark-boat and imagined that the Committee had altered the course.

The Proper Thing.

Naturally, the Italians lodged a protest, and, so far as one can gather, the Committee of the Royal Aero Club intends to do the proper thing by them. That is to say, if the mystery of that mark-boat is explained the representative of the Royal Aero Club will move a motion at the meeting of the Fédération Internationale Aéronautique in October that the Schneider Cup for 1919 and the accompanying prize be awarded to Italy, on the grounds that Janello flew the full distance specified in the rules, and that any error in the course was not his but was due to a British mistake. If we cannot be organisers we can as a rule be sportsmen and gentlemen, and that seems to be about the only way in which the Royal Aero Club can get out of a very awkward position.

Finally.

From the British point of view the Schneider Cup Competition has been a lamentable failure, but there are many valuable lessons to learn from it. British aircraft constructors have learned their own lessons, which are quite obvious and will not need repeating. And, anyhow, the British constructor is very quick to learn. What is most necessary is that the Royal Aero Club, the recognised governing body of the sport of flying, should learn its lessons.

Lieut.-Commander Harold Perrin is a wholly admirable secretary. He has done wonderful work for the Club in the past, and he did everything that one man could do to make the Schneider Cup Competition a success. But in the first place no one man could possibly do all the work of such a competition, and in the second place a secretary is by rights a kind of chief-of-staff, and is not even a generalissimo, let alone a combination of army, corps, division and brigade commanders all in one.

What caused the fiasco, so far as one could judge on the spot, was that the Committee of the Club, as a committee, did little or nothing during the day, except enjoy a very pleasing picnic individually, and before the day the Committeee neglected to appoint officials for the various duties which should have been done. These have been indicated in the course of this lengthy narrative, and one hopes the indications will be of use.

Officious officials are a nuisance at any time, but they are better than no officials at all, and, so far as sports are concerned, in some thirty years' experience of such matters one has learned convincedly that the more really officious officials one can collect to run a sports meeting the better the meeting will be run. They are a nuisance, but they do make things and people move. It was just such people who were lacking at Bournemouth.

To sum up the whole thing, the first and greatest mistake was holding the race at the wrong place, with mobile headquarters. The second was insufficient study of weather conditions and neglect to allow for the possibility of a dead calm day with a sea fog. The third was the absence of properly appointed officials to attend to the multifarious details of such a competition. And the fourth was the absence of a Competition Committee composed of people with practical experience of running competitions, people with a strongly developed critical faculty, and people with acute imagination.

The Committee of the Royal Aero Club is a wholly estimable body. The members individually possess personal charm and unimpeachable honesty. But as a Committee they are better fitted to run a Department under the Air Ministry than to undertake the management of a great international competition in which keen comprehension, foresight, forethought, firmness, and quickness of action are necessary to success. In fact, if the Schneider Cup Competition had been conducted by the Department of Civil Aviation it could not have been done very much worse.

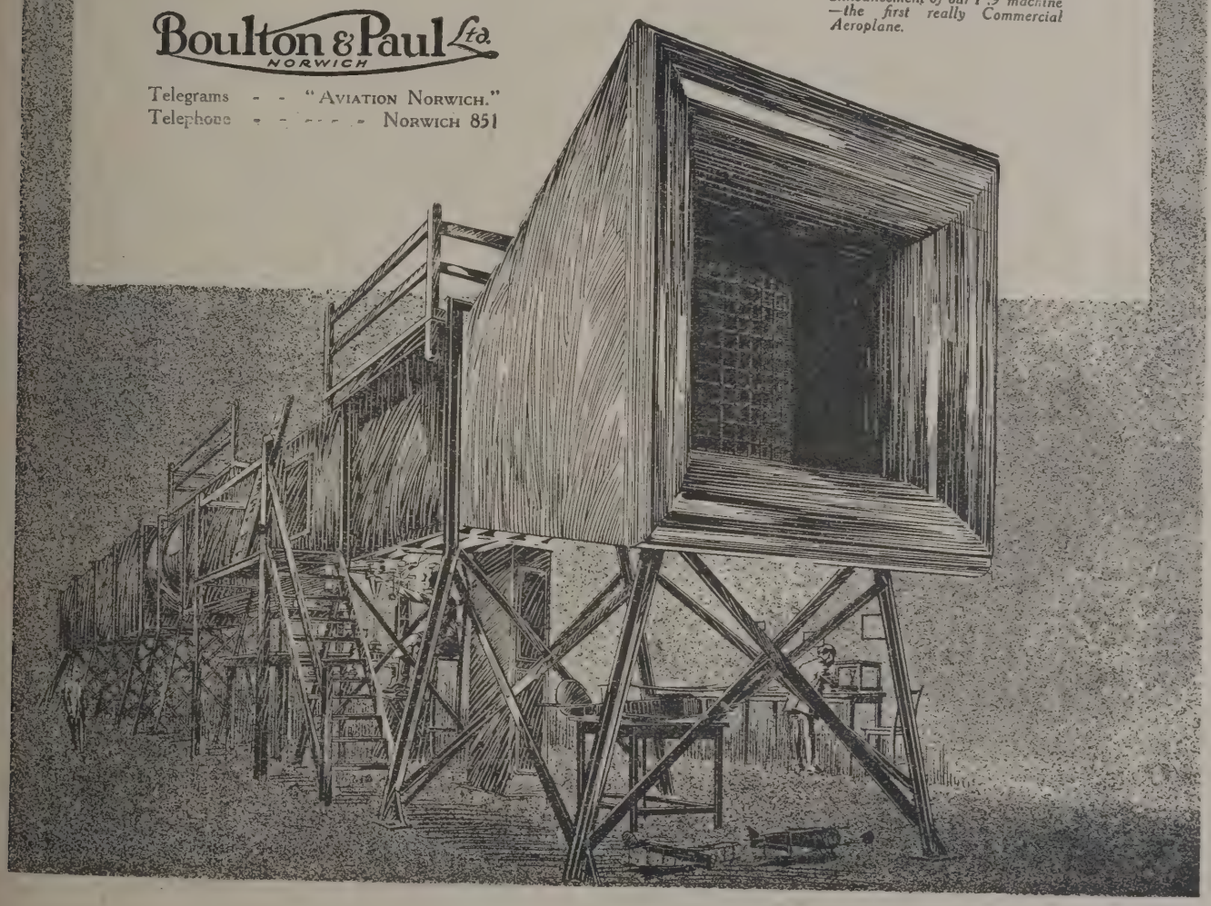
Nevertheless, we live and learn, and it is to be hoped that by the next time we have to run a big competition in this country either the Royal Aero Club will have a new Committeee or the present Committee will have learned its lesson from this failure.—C. G. G.

AIRCRAFT IN THE MAKING.—No. 1

Being one of a series of announcements which describe and illustrate interesting Scientific Devices, Instruments and Machinery utilised in the designing and making of B. & P. Aircraft.

THE WIND CHANNEL

One of the most valuable aids to our designing is the Wind Channel. Owing to the limitations of fluid dynamic theory, model experiments are introduced to bring the Aeroplane within the scope of rigid dynamics. For these experiments the instrument is the most important piece of apparatus.



The Boulton & Paul Wind Channel is an instrument of the highest degree of accuracy. Apparatus for determining Forces, Moments, and Derivatives are installed. Many of the unique recording instruments being designed on the works.

Only by these methods is it possible to ensure the desired stability and controllability as well as efficiency which means economical flying.

See elsewhere in this issue the announcement of our P.9 machine —the first really Commercial Aeroplane.

AN OFFICIAL PROTEST

The following letter has been sent to the Royal Aero Club by the Savoia Company :—

Gloster Hotel, West Cowes, I. of Wight,
Sept. 11th, 1919.

The Committee, Royal Aero Club, Clifford Street.

RE SCHNEIDER CUP RACE.

Gentlemen,—We confirm our telegram of even date herewith as follows :—

"Schneider Cup. Please note we appeal against the decision of Committee declaring race void on account of Mark boat observe Swanage end statement that he did not see our Savoia machine, our pilot saw distinctly at that end of course a boat with same mark as boat at Christchurch. We understand that a third mark boat was on the course, and we request investigation and inquiry as to whereabouts of this boat. We request revision of decision against which we formally appeal to the Committee of the Aero Club.

"D. LAWRENCE SANTONI, President,
Società Idrovolanti Alta Italia."

We beg formally to appeal against the decision of the Race Committee declaring the race void and disqualifying Savoia seaplane on the statement that the observer on the mark boat situated at the Swanage end of the course, that he did not observe our machine.

We appeal on the following grounds, and we demand an inquiry into the facts mentioned below :—

1. Our pilot made the circuit 11 times complete. On each circuit he distinctly recognised the mark boat with the red and white sign at the Swanage end of the course, exactly similar to the boat situated at the Christchurch end.

2. Observation from below may have been obscured by the mist.

3. We have been informed that there were three mark boats, and as our pilot distinctly saw, during the whole of the race at the Swanage end, a boat exactly similar to that at Christchurch with the same marks, he evidently took this boat as the turning point, and if this is the case, the error is due entirely to bad organisation on the part of the arrangement of the Committee, for which we are, naturally, not responsible.

We also protest against the manner in which the race was managed, and against the absence of proper indication to the pilots of the change in the time, and in the order of starting.

The rules hereon laid down by the Committee were not adhered to. Proper and definite notice of such change was not intimated to our pilot, who received his information from a source outside the official one. No proper and effective provision was made to enable the mechanics attached to the foreign seaplanes to approach their respective pilots in order to supply them with petrol, or to inquire as to their wants. Nevertheless, we had been assured by the Secretary of the Club that a special motor-boat would be at the disposal of each competitor at Bournemouth in order to bring mechanics and petrol, etc., to the pilots.

We say we complied with all the rules and conditions of the race, our pilot having, as a precaution, completed more than the 200 miles prescribed by the Rules, and we claim to have won the Cup and the pilot's prize, and we request you to revise the decision of the Race Committee, and to make a searching inquiry into the points above-mentioned.—We are, Gentlemen, for the Societa Idrovolanti Alta Italia,

D. LORENZO SANTONI, President.

SCHNEIDER CUP NOTES

The following notes as to the events immediately preceding the Schneider Cup Race arrived too late for inclusion in last week's issue, and are here printed to complete the story.

THE NIEUPORT'S RUN OF BAD LUCK.

Two of the Nieuport machines built for the race crashed on their trials in the Seine. The reserve machine left Paris on Sunday, Sept. 7th, about 2 p.m., and, flown by Lieut. Casale, reached Cowes in 2½ hours. Unfortunately, alighting in the Medina the machine hit a mooring buoy and crashed. She was recovered during the evening, and work upon refitting with new floats and wings was started at once, and there seemed every possibility that she would be ready in time for the race.

This reserve machine was fitted with the long streamline type of floats described in "Aeronautical Engineering" of last week, and not with the original Nieuport type.

A second Nieuport was expected at Cowes on Monday, but had not arrived at 6 p.m.

THE SPAD.

The Spad arrived at Cowes on Saturday, Sept. 6th, and by Monday morning was completely erected. The machine was obviously not new, and had had a fair amount of flying—though possibly not as a seaplane.

She is a very pretty and extremely Hunnish looking job The fuselage is an oval monocoque of the very cleanest type. The upper and lower wings are of about equal span, but the upper wing has a much more pronounced rounding-off at the tips than has the lower, and is heavily swept back from the centre. The lower plane alone is fitted with ailerons.

The floats fitted are not the streamline affairs with hydrovanes, originally intended, but long, stepped, pontoon floats very like those of the Nieuports, carried on a very complicated and rather curious chassis. On the water the machine handles well and certainly looks very fast when in flight.

ITALY'S REPRESENTATIVE.

The Savoia boat appeared to be complete, and the Isotta-Fraschini engine was run on Monday afternoon, Sept. 8th, and a trial trip made in the evening. The machine itself is a very normal affair—rather reminiscent of an F.B.A. somewhat cut down and fitted with an excellent engine.

THE BRITISH ELIMINATING TRIAL.

The delayed trial between the Supermarine flying-boat and the Avro was flown off at 4.30 on Monday, Sept. 8th. The machines were started from Cowes, flew to Bournemouth Pier and back, alighted, and again made to take off. On actual time there was very little to choose between the two—both averaged somewhere round 130 m.p.h., and after some deliberation the Committee of the Royal Aero Club nominated the Supermarine as the third British representative.

On speed the Avro's was somewhat the better performance, but it is believed that the Committee were of the opinion that the Supermarine boat stood a much better chance of surviving the alighting and getting-off tests if the day of the race should prove at all rough.

The British team therefore stood as follows :—

(1) Sopwith seaplane, 450 h.p. Cosmos engine (Mr. Hawker pilot).
(2) Fairey seaplane, 450 Napier engine (Lieut.-Col. Nichol pilot).
(3) Supermarine flying-boat, 450 Napier engine (Squad-Comm. Hobbs pilot).

With the Avro, 240 h.p. Siddeley Puma (Capt. Hammersley pilot) in reserve.

THE MEMBERSHIP OF THE AERO CLUB OF FRANCE.

The total membership of the French Aero Club is 1,930. The club has passed through very difficult times during the war, and only admitted an average of 97 new members per year during the war. The figures are as follows :—

Members to end of 1913	1301
New members, 1914	81
,, ,, 1915	26
,, ,, 1916	87
,, ,, 1917	114
,, ,, 1918	178
First 3 months of 1919	143
Total membership	1930

THE INTERNATIONAL AIR CONVENTION

The Air Ministry announces :—

The Convention relating to International Air Navigation was formally approved subject to one or two minor reservations, by the Supreme Council of the Peace Conference, at a meeting held at St. Germain immediately after the signature of the Peace Treaty with Austria on Sept. 10th.

This document, which is one of the most interesting of the agreements made by the Powers taking part in the Peace Conference, is very comprehensive, and deals amongst other things with such subjects as Sovereignty of the Air, Space above Territory and Territorial Waters, International Air Law, Nationality of Aircraft, Certificates of Airworthiness, Conditions of Admission of Air Navigation above Foreign Territory, Rules to be observed on Departure, on Landing, and when under Way, Prohibited Articles and the Institution of an International Commission for Air Navigation.

There was little or no precedent to guide the Delegates in the framing of the Convention, and in its drafting it was essential that our Dominions, our Allies, and as many as possible of the neutral States should participate. To secure agreement in 11 weeks as was done on a subject affecting so many different interests is no mean achievement.

The signatories to what may be regarded as the Charter for Civil Aviation throughout the world are as follows :—

United States, Great Britain, France, Italy, Japan, Belgium, Brazil, Cuba, Greece, Portugal, Roumania, and Serbia.

THE BOULTON & PAUL—P. 9.

An Aeroplane which is a Sound Commercial and Private Proposition

In this P. 9 Machine we have, we feel, solved the problem of providing an Aeroplane which is a sound business proposition—and which combines with low cost the great essentials for Commercial and Private use. All our great resources of material and craftsmanship have been utilised. Scientific Research and Experiment by a staff associated with flying from its beginnings coupled with the great Experience gained through the building of thousands of Aeroplanes during the War, have been concentrated in the production of this P. 9 Model.

It is a Two-Seater—Single Engine Tractor—which has attained on test a speed of over 100 miles per hour.
Its outstanding features are :—

CHEAP AND EASILY HOUSED. The Initial cost is extremely low—£700—and the cost of running for a machine of this type and performance is reduced to a minimum. Owing to its small size it is easy to handle on the ground and requires but little accommodation. The principal dimensions are: Span, 27 ft. 6 in.; Length, 25 ft.; Height, 10 ft.

EASY TO FLY. The P. 9 has a big speed range, and low landing speeds, and this combined with Stability at all trimming speeds and well-balanced controls, allows the machine to be flown for long periods without undue fatigue. It also gives the maximum of Safety possible.

COMFORT AND CONVENIENCE. The comfort of the Pilot and Passenger has been specially considered. Each Cockpit is roomy and fitted with our special Seats. Controls for both Flying and Engine are fitted in the front and rear Cockpits to enable the machine to be flown from either position. The exhaust from engine is discharged behind the rear Cockpit giving a silencing effect and freedom from fumes. Two standard cases are provided for luggage and form part of the fairing immediately behind the rear Cockpit.

The uses to which this compact and efficient machine can be put are wide and various, and will suggest themselves to those who have been awaiting the stage of Aeronautical Development now reached by the P. 9. It can be used for dozens of Commercial Purposes. The same type carried photos from R. 34 direct to London. It has been sent to Australia for Sheep-runs—and will soon be in use in various parts of the world for Exploring Uncharted Territory, Examining Timber Tracts, Fighting Forest Fires, Carrying Mails to Distant Mines, Transition of Colonial Mails to Mail Steamers, and for General Patrolling and Police Purposes.

£700 **If you are interested—write for full particulars. State your needs or purpose, and our engineers will consider every detail closely—to advise soundly.**

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

The Francis Mond Professorship.

The election to the recently established Francis Mond Professorship of Aeronautical Engineering at Cambridge will take place on Friday, Sept. 26th.

An Attempt to Fly Round the World.

According to German newspapers, the pilot Boehm, who is well known in Germany for the feat of remaining twenty-four hours in the air, proposes to make an attempt to fly round the world.

The "Vossische Zeitung" considers that Boehm's twenty-four-hour flight as a feat of endurance surpasses even the British and American flights across the Atlantic.

It is good news to hear that Herr Boehm survived the war.

International Air Routes.

An international conference of the representative aerial transport companies of Norway, Sweden, Denmark, and Germany, summoned at the instance of Mr. Holt Thomas, chairman of Aircraft Transport and Travel, Ltd., of Great Britain, has just been held at The Hague.

The meetings, extending over several days, under the presidency of Maj.-Gen. Sir W. S. Brancker, were held by permission of the Dutch Government at the Ministry of Agriculture, Industry, and Trade; and, as their outcome, it was decided to form the International Air Traffic Association, the object of which will be to facilitate the commercial operation of long-distance "airways," more especially in the northern part of Europe.

145 Miles an Hour.

In an international air race, flown round a closed circuit of 136 miles, in connection with the Aircraft Exhibition at Amsterdam, the fastest time was that of Capt. Gathergood, who, piloting an Airco 9R (450 h.p. Napier Lion) biplane, averaged a speed of 145 m.p.h.

Life Insurance for Airship Passengers.

One of the passengers on the R.33 during its cruise to the Continent insured his life for £1,000. The premium was under £2.

A Banquet.

A banquet is to be given to Mr. Handley Page on Saturday, Sept. 20th, by the Cheltenham Chamber of Commerce to honour him as a distinguished citizen of the town.

Airships in Peace and War.

A very excellent exhibition has been arranged by Lady Sybil Grant, at the Princes Galleries, under a host of difficulties, as explained in the foreword of the catalogue, in an effort to educate the rather dense British public in the colossal amount of work achieved by airships in the past, principally during the war; and also in the huge possibilities that present themselves for the future.

Both the Air Ministry and the French Airship Department have lent their support, and together with a large number of private firms connected with the airship industry have brought together a comprehensive collection of parts accessories, models, photographs, paintings, etc., which illustrate the wonderful progress of the airship from pre-war times to the present day in a particularly graphic manner.

The opening day did not attract a "huge" crowd, but the G.B.P. was ever an unobservant tribe, and unless notices are continually thrust before its gaze, such as one gets concerning certain brands of pills, or systems of furnishing the home on one's separation allowance, a certain period of time must elapse before the preliminary Press notices take the necessary effect. Perhaps if the Jazz-band were accommodated in the basket of a captive Caquot balloon somewhere over Piccadilly it might have the desired effect.

Nevertheless, it is to be earnestly hoped that the exhibition will meet the success it deserves, more particularly since the profits go towards founding an "Airship" bed at the St. Dunstan's Home.

The exhibition is arranged in three rooms, the principal exhibits in each gallery being grouped as follows :—(I) French exhibits lent by the French Government; (II) Autochromes, cloud photographs, etc.; and (III) A collection of Airship accessories, such as types of valves, blowers, instruments, etc., together with a series of models, etc. In addition, there is a large number of commercial exhibits, a show of bombs and armament, as well as an excellent collection of official photographs and paintings; and finally mention should be made of the Masked Airship Band which dispenses syncopated music daily.—L. L. B.

Comparative Speeds.

In the "Daily Express" Maj.-Gen. Sir W. S. Brancker, K.C.B., A.F.C., is reported to have said recently : "Britain's airships, including the R34, are too small and much too slow. The airships, for passenger or goods transport, will be of little value, and for this reason the Government, when they sell the ships, must not expect to make a profit. They must, in fact, be sold at a low percentage of their original cost.

"The R34's performance, creditable as it was, shows that even our largest flying craft can get to America in little better time than ordinary steamships. Exporters who are asked to send their goods by air, and incidentally to pay double or treble the shipping rates, will want something speedier.

"The Government may have to subsidise the development of airship construction. The French Government are already doing this on a large scale. Airships will pay if we build them larger, with more power, and with greater lift.

"Larger ships, however, will mean larger sheds and—capital. Whether or not money for this purpose will be forthcoming from ordinary sources is problematical. Personally, I do not think it will."

Flying Backwards Through Time.

At the R.A.F. Club the other day, a member who is fond of leg-pulling was talking learnedly on the subject of flying backwards through time. After pointing out that as at the equator the earth revolves at the speed of about one thousand miles an hour, which speed naturally diminishes towards the poles, he argued that at a certain latitude the speed would be less than 100 miles an hour, so that if an aeroplane flew in the opposite direction to the earth's movement at a speed of more than 100 miles an hour, it could arrive at various points before it started. For instance, it could start at lunch time and travel backwards through the morning to breakfast time, and the only danger would be that one might travel backwards to the time when one was in bed and asleep, and then one might crash.

Some members, whose ideas of local time were vague, found that the problem required quite a lot of thinking over.

A Megaphoned Mistake.

On Wednesday, September 10th, the day allotted for the decision of the Schneider Cup Race, three of the Supermarine Passenger Flying Boats were moored to the West and inside of Bournemouth Pier. On one occasion during the afternoon, an official motor launch was visiting the competitors in the International Seaplane Race, with instructions to be ready to start within a quarter of an hour, and much to the surprise of the occupants of these three passenger machines instructions were megaphoned to them by the official on board the launch that they also were to be ready to start in a quarter of an hour.

A New Altitude Record Claimed.

It is said that one of the Curtiss Co.'s testing pilots, Mr. Rowland Rohlfs, on Sept. 13th, rose from Roosevelt Field, Long Island, to a height of 34,200 ft. Mr. Rohlfs started out to test a machine in preparation for an officially observed attempt to beat what is claimed to be the world's altitude record of 33,136 ft., held by Adjutant-Casale, of the French Army, but found conditions so favourable that he decided to try how high he could ascend. As it was unobserved, the "record" is unofficial, but Mr. Rohlfs will try on the first favourable day to make an authenticated attempt. At 34,000 ft. Mr. Rohlfs found a temperature of 44 deg. below zero, but discovered what a scientific writer recently described as "a temperature lid" a little above that height, as at 34,200 ft. the thermometer registered four degrees higher. Mr. Rohlfs machine was a Curtiss war triplane with a 400 h.p. Curtiss engine.

A Pretty Style.

The following advertisement recently appeared in the "Times" :—

> "Demobbed officer, R.A.F., age 26, plus 3 golfer, with the correct, pretty style, has also a knowledge of motors, seeks appointment as private professional or companion; small salary."

Also a pretty literary style.

ROLLS ROYCE

WARNING

Changes to Rolls-Royce Cars

Rolls-Royce Ltd. have recently learned that attempts are being made by certain persons to "bring up to date" pre-war Rolls-Royce chassis by substituting for Rolls-Royce Springs of old type cantilever springs which are not of Rolls-Royce manufacture; also by substituting other radiators and bonnets which are not of Rolls-Royce manufacture. Some of these changes have been brought to the attention of the Company, who have found them to be not only unsatisfactory but possibly dangerous to the users. Owners who are asked to have such changes made to their Rolls-Royce cars, or potential purchasers of Rolls-Royce cars on which such changes have been made or may be suspected, should communicate with Rolls-Royce Ltd., 15, Conduit Street, London, W.1, and the Company will, for a small fee, inspect the chassis in question and inform the applicant what parts, if any, are not supplied by Rolls-Royce, and what the effect of such parts in their opinion is likely to be. Furthermore, any such alterations which interfere with or depart from Rolls-Royce standards will probably put the car out of action for an indefinite period in cases of accident or breakage, as Rolls-Royce new parts cannot be expected to replace foreign broken parts in a "bedevilled" chassis.

ROLLS-ROYCE Ltd., 14 & 15, Conduit Street, London, W. 1.
Telegrams: "Rolhead, Reg., London." Telephone: Gerrard 1654, 1655, 1656.

RECENT
AIRCO SUCCESSES

THE AERIAL DERBY, 1919

THE winning machine, an Airco 4R, with a Napier engine, averaged a speed of 129 miles an hour—since declared a record by the Royal Aero Club. Two other Airco machines started, the Airco 4, with a Rolls-Royce engine, and the Airco 9, with a Siddeley "Puma" engine. The Airco 4 finished third, and the Airco 9 fifth. Of the seven machines finishing three were Aircos.

FIRST THIRD AND FIFTH

THE AMERICAN AERIAL DERBY

IN this race, just flown over a course 1,042 miles in length, the winning machine, an Airco 4, averaged throughout a speed of 136 miles an hour; while the second and third places were also secured by Airco 4's.

FIRST SECOND AND THIRD

INTERNATIONAL RACE AT AMSTERDAM

IN this contest, flown in connection with the Aircraft Exhibition at Amsterdam, there were between thirty and forty starters, including the fastest of the French and Italian machines. The first and second speed prizes were won by Airco machines. The Airco 9R, with a Napier engine, the fastest machine in the race, covered the closed circuit of 130 miles at a speed of 145 miles an hour; while the second fastest time was that of the Airco 4A, with a Rolls-Royce motor.

FIRST AND SECOND SPEED PRIZES

THE AIRCRAFT MANUFACTURING COMPANY, LIMITED

London Office: 27, BUCKINGHAM GATE, S.W.1.

Chairman (and Founder 1911), Mr. G. HOLT THOMAS.

NAVAL & MILITARY AERONAUTICS

GREAT BRITAIN.

NAVAL.

ADMIRALTY APPOINTMENTS.

The following appointment has been made:—
SEPT. 13TH.—Sub. Lieut.—P. R. Fryer, to "Furious," Sept. 12th.

A British flying boat containing two officers recently arrived at Sordavala on the Finnish shore of Lake Ladoga. The boat had been flown from the Murmansk front and started on its return journey on Sept. 6th.

* * *

The British seaplane ship "Vindictive" has anchored at Copenhagen.—H1.

* * *

The aeroplane-carrier "Hermes" was launched on Sept. 11th from the shipyard of Sir W. Armstrong, Whitworth and Co., Ltd., on the Tyne. It is probable that she will be the last large vessel launched for the Navy for a long time.

Most of the vessels of this class were converted or adapted for aeroplane work, but the "Hermes" was laid down as a carrier in January, 1918, and in her construction and equipment advantage has been taken of the experience gained in the earlier ships. The "Eagle," a converted aeroplane-carrier, has also been launched at the Armstrong yard.

The "Hermes" has a length of 548 ft. and 70 ft. beam, with a displacement of 10,950 tons, and geared turbine engines of 40,000 h.p. capable of developing a speed of 25 knots. As in the case of the "Argus," the whole length of the flying deck of the "Hermes" will be available for starting and receiving the machines, and, by special arrangements for the emission of the hot gases and smoke, there will be no funnels or other obstructions. Under the flying deck are the hangars for the machines, as well as the workshops for their repair. Two electrically controlled lifts are fitted, the one forward and the other aft, for hoisting the aeroplanes to the flying deck. Another special feature of her design is a system of ventilation to lessen the danger of fire from petrol fumes.

The armament of the "Hermes" will consist of a number of light guns for anti-aircraft protection and several 6 in. guns for heavier work. In her construction, as a defence against torpedo attack, the "blister" system has been used. The complement of the vessel will comprise 500 naval ratings and 130 members of the Royal Air Force. It is expected that the "Hermes" will be completed early in 1920.

It is to be hoped that in the next war she will not be the victim of such a mistake as was her predecessor.

* * *

It is reported that a case of considerable interest will come before the War Inventions Committee during the course of the next few weeks. Capt. W. O. Bentley, the inventor of the Bentley rotary aeroplane engine, will claim recompense for the use of his invention. The amount claimed is said to be £100,000.

Capt. Bentley, who has served both in the R.N.A.S. and the R.A.F., was frequently in France and Flanders during the later stages of the war on duties connected with his engines.

MILITARY.

OFFICIAL COMMUNIQUES.

The War Office issued the following communiqué on September 15th: Touch has been gained by aeroplane with General Mamontoff, who, in the middle of August broke through the Bolshevik lines facing the Volunteer Army, and has been carrying out a raid on a large scale around Tamboff.

Kronstadt was bombed twice on Sept. 4th. The "Berlingsketidende" states that British aviators again attacked Kronstadt on the night of Sept. 7th-8th. The Bolsheviks had anti-aircraft guns in action, but did not seem to mind the air attack. Their searchlights were only directed on the sea, and they evidently feared an attack on the remainder of the Russian Baltic Fleet. But the British only made an air raid, and the number of fires proved the effect of their bombs.

A British pilot was bombing Kronstadt recently when his engine stopped. With a fierce barrage surrounding him, he glided across the 12-mile stretch of water to the Finnish coast. He landed on the beach, repaired his engine and flew back to the Bjorko base.

AIR FORCE.

An official announcement from the War Office states that an Army Entrance Examination for the Royal Military Academy, Woolwich, and the Royal Military College, Sandhurst, will begin on November 4th. Candidates must have attained the age of 17½ on January 1st, 1920, and must not be more than 19 on November 1st, 1919. An exception is made in the case of candidates who are serving or have served satisfactorily in the Navy, Army, or R.A.F.

A limited number of cadetships at the Royal Air Force Cadet College will also be open to competition, and will be awarded to candidates who fulfil certain conditions laid down by the Air Ministry from which particulars may be obtained on application. A candidate who fulfils all the necessary conditions may compete for a cadetship at the Royal Air Force Cadet College, and also for a cadetship at the Royal Military Academy or Royal Military College. Candidates desiring to do this must express definitely their order of preference before the examination begins. A candidate may say that if he is not among the first (so many) successful competitors for the Royal Military Academy or Royal Military College (as the case may be) he will elect for a cadetship at the Royal Air Force Cadet College. Cases may, however, arise in which it would not be possible to give effect to such conditional preference.

* * *

The Air Ministry has decided to demobilise the R.A.F. pigeons. It is stated that all the pigeons used in the Force were presented to the Government by fanciers, and it is hoped that these birds, which did good service, will now be returned to their original owners.

* * *

The Air Ministry made the following announcement of the trip of the R.33:—

"Following upon the conference held on Sept. 8th relating to the Government airship programme, it has been arranged that H.M. Airship R.33 shall carry out a flight of about 86 hours' duration in order to demonstrate the capabilities of lighter-than-air craft and as a practical illustration of the comfort afforded to passengers travelling in airships. Invitations to take part in this voyage have accordingly been extended to leading members of industry and representatives of Home and Colonial Government Departments interested in the commercial development of this type of aircraft. On board also is Lieut. de Vaisseau Sablé, Air Attaché to the French Embassy in London. In addition there are the following officers:—Air Commodore E. M. Maitland, C.M.G., D.S.O., A.F.C.; Flt. Lieut. G. M. Thomas, D.F.C., who is captain of the R.33; Flt. Lieut. H. A. H. Leetham, second officer; Flt. Lieut. S. E. Taylor, D.S.C., third officer; Pilot Officer W. E. James, engineer officer; and the crew, which consists of 27 men.

"Every possible attention has been paid to the comfort of the guests. Sleeping berths have been rigged in the internal keelway of the vessel, in which the passengers will rest during the night. Meals will be served in the mess-room, also in the keelway, hot and cold water will be available, and the news of the day will be transmitted to the airship by wireless telegraphy."

The R.33 left Pulham, Norfolk, at 9 p.m. on Sept. 10th. She had ten passengers on board, including a number of prominent business-men: Mr. Sydney A. Boulton, of Lloyds; Mr. J. Dunn; Mr. Benjamin Guinness; General Sir Sefton Brancker, of the Aircraft Manufacturing Co.; and in addition Commander Foakes, R.N., representing the General Post Office; and Mr. E. A. Box, Secretary to the High Commissioner of Australia. Most elaborate arrangements were made for the comfort of the passengers. Beds complete with all bedclothes were provided. A chef and a head waiter from the Criterion Restaurant cooked and served sumptuous meals cooked on the exhause-pipes and a small electric stove.

The R.32 left Pulham at 8 p.m., one hour before the R.33. The weather was excellent. The R.33 crossed the coast at Lowestoft and set a course to the mouth of the Thames, proceeding from the North Foreland to the Belgian coast at Ostend, which was reached at about 4 a.m. Shortly before 5 a.m. the coast of Holland was crossed at West Kapelle, and

The Hague was reached by 6 a.m. At about that time the R.32 was sighted flying low on the port side of the R.33. A signal was sent to her by wireless asking her to keep in company as far as Amsterdam, which was reached at 7 a.m. The R.32 then returned to Pulham. Messages were dropped at Amsterdam and at many other places. Rotterdam was reached at 8.15 a.m.

It was then decided to abandon the visit to Paris as landing might have been difficult owing to the amount of water ballast which had been dropped in the night. Therefore the battle-fields were then visited and the passengers obtained a good view of them from a height of 3,000 ft. Antwerp was reached at 10.40 a.m. South of the town and over the district of Hoboken what appeared to be German submarine shelters were observed on the banks of the Scheldt.

A message was dropped into Brussels at 12.45. Lille was passed over at 2.40 p.m. A return to Nieuport was then made by way of Armentières and Ypres. In that district salvage parties are clearing the ground, and the streaks of smoke from their fires can be seen over the shattered, desolate, and waterlogged waste. The journey over the sea was made to Suffolk and a landing was made at 6.20 p.m. on Sept. 11th, after a trip of about twenty-one hours. Over France on the return journey there was some head wind, but not enough seriously to interfere with the progress of the airship. A number of photographs were taken, but the ground haze probably interfered with many of them.

By special arrangement, which had been made in advance with the Marconi wireless station at Wormwood Scrubs, a complete summary of the news of the day was dispatched to the R.33 from the "Times" Office in Printing House Square. The last sentence of the summary was received by the aerial liner shortly before 4 a.m. while she was flying over the North Sea at 4,000 ft. The messages were typed out on sheets of special paper, by 6 o'clock the newspaper had gone to press, and at breakfast time, two hours later, the passengers on the R.33 received with their eggs and bacon the first copy of the aerial edition of the "Times."

The passengers were delighted with their trip. One remarked that he never expected a comfortable sleeping-berth, a dining-room, oysters for lunch, and electric light, nor did he expect to be able to roam all over the ship and from one gondola to another.

* * *

An aeroplane, piloted by Lieut. Kennedy left St. Raphael (Var) on Sept. 10th on a flight to India, via Taranto and Egypt.

BELGIUM.

The King of the Belgians flew from Brussels to Ostend during the afternoon of Sept. 8th. He then inspected the repairs carried out in the port, and returned by air to Brussels in the evening.

FRANCE.

The French military authorities have for some considerable time been running the following aerial services in the Near East assisted by the Serbian and Greek military aviation arms both of which are commanded by French officers.

(1) Athens-Salonica (208¾ miles). Landings are made intermediately at Larissa and Lamia. This service, which has been in existence for over a year, is run weekly during the winter and twice weekly during other seasons.

(2) Constantinople-Salonica (310¾ miles). Landing intermediately at Dedeagatch. Service irregular.

(3) Constantinople-Bucharest (298 miles). Landing intermediately at Lulu Burgas. Twice weekly since May last.

(4) Bucharest-Galatz-Kichinev (186 miles). Intermittent service.

The steamer "Mingrelie" left Dakar on Sept. 6th having on board the remains of the Farman biplane "Goliath" which is now being brought back to France. The pilot, Lieut. Bossoutrot, and his crew are returning in the same ship.

Commandant Vuillemin continuing his flight from Cairo to Paris left Constantinople at 7 a.m. on Sept. 8th and reached Istres, near Marseilles, at 8 p.m. on the same day, having landed at Naples en route. On Sept. 9th he continued his journey and reached Villacoublay at 7 p.m. He thus completed safely his journey Paris to Cairo and back which began on Aug. 11th. The total distance covered is about 5,500 miles.

The French nation has ever excelled in the creation of heroes. There is a national swiftness of perception in these matters and a delicate grace in the recognition of gallantry. As an instance of the manner in which the Army does honour to its heroic dead, the last citation of Captain Guynemer, a General Order of Oct. 16th, 1917, is here reprinted :—

"Le général commandant la 1re armée cite à l'ordre de l'armée le capitaine Guynemer, commandant l'escadrille No. 3.

"Mort au champ d'honneur, le 11 Septembre, 1917. Héros légendaire tombé en plein ciel de gloire, après trois ans de lutte ardente. Restera le plus pur symbole des qualités de la race.

"Ténacité indomptable, énergie farouche, courage sublime. Animé de la foi la plus inébranlable dans la victoire, il lègue au soldat français un souvenir impérissable qui exaltera l'esprit de sacrifice et provoquera les plus nobles émulations."

The memorial ceremony took place at Le Bourget on Sept. 11th. At four o'clock General Duval, Director of Aeronautics, and his staff arrived at the aerodrome and took the general salute from the troops on the station. He then read the last citation of Guynemer quoted above, and immediately afterwards presented various decorations to officers and men. The bands played the Marseillaise and the ceremony ended. During the proceedings the aviator Fronval flew with customary brilliancy and verve.

GERMANY.

According to the German paper, "Freiheit," the 426th Detachment of the Air Service recently joined the Russian counter-revolutionaries. The Detachment is still in communication with the Military Departments in Germany, and is receiving Army stores. Some men from the detachment arrived in Berlin on Sept. 10th to fetch three aeroplanes. Other machines will be sent shortly.

ITALY.

On Monday, Sept. 8th, Petty Officer Guarnieri, R.I.N., piloting a Savoia flying boat, left Lake Maggiore, with Lieut. Campacci, R.I.N., as observer. After flying over the Alpine chain in the St. Gothard region, and crossing Switzerland from south to north, he struck the Rhine Valley, and followed it. He arrived safely at Amsterdam after a non-stop flight.

Maggiore Gabriele d'Annunzio, whose fame as a dramatist has almost been equalled by his gallantry as an aviator, has as has been stated, organised with some publicity a flight from Rome to Tokio. On Sept. 12th he appears to have destroyed any chance of his attaining further distinction as an aviator or of reaching Tokio save as a refugee by a singularly rash interference in the affairs of nations. On the afternoon of that day he led a force of about 10,000 Italian Grenadiers and Arditi, with armoured cars and machine guns, to the port of Fiume (which, to the annoyance of the Italians, was not given

ANCIENT HISTORY. — A Short Seaplane (225 h.p. Sunbeam engine) in Central Africa. Very little has been heard of the work of these machines in that particular part of the world during the late war. The R.N.A.S. Detachment in Central Africa was not so widely advertised as was its less fortunate squadrons on the Fronts nearer to England and the world of newspaper correspondents.

to Italy in the Peace Treaty). Fiume has recently been administered as a temporary measure by an Italian general aided by Allied troops. According to the latest reports, Maggiore d'Annunzio seized the town and is now in the seat of power. The Italian troops in Fiume when called upon to repel the d'Annunzio attack revolted and transferred their allegiance to the insurgents.

The Italian Premier, in a speech in the Chamber, denounced Maggiore d'Annunzio's action and stated that vigorous measures were being taken to suppress the revolt. General Badoglio, the Deputy Chief of the General Staff, has gone to Fiume with complete powers.

The Italian correspondent of THE AEROPLANE writes :—

It transpires that among other unaccountable fatalities the death of the Naval officer-pilot Umberto Calvelli has caused the absence of an Italian seaplane squadron from the Amsterdam Show. Giovanni Ravelli is one more of the great naval war aces who have gone out in this last disastrous month. One is led to ask what effect the intense solar heat may have had on the artificially-seasoned timber of the use of which one has heard.

Italian seaplanes have been sent to St. Raphael to pass French Government tests.—T. S. H.

RUSSIA.

The "Daily Express" correspondent reports that Bolshevik aviators have dropped eleven bombs at Kellomaki, near the Finnish frontier, but caused only insignificant damage.

SPAIN.

The Farman biplane flown by M. Chevillard from Paris to Madrid where it arrived on Sept. 9th has been delivered to the Spanish Government for use in a Military aviation school. One machine of the same type has previously been delivered.

U.S.A.

A recent issue of the "Aircraft Journal" stated that mechanically inclined men were wanted for service aboard the U.S.S. "Shawmut," the only aviation mother ship in the U.S. Navy. The "Shawmut" is releasing aviation mechanics in accordance with orders received recently, and the vacancies are to be filled.

The "Shawmut" acts as tender for ten seaplanes and will be attached to the Atlantic Fleet. Four of the seaplanes are carried on board ship. The other six are known as air boats —big seaplanes of the F-5 type. Air boats are flown from port to port, and engage in all fleet manœuvres. The "Shawmut" will proceed to Newport soon for aerial bombing practice and for seaplane observation of torpedo tests.

The Missouri Aeronautical Society, of which Major A. B. Lambert is president, has arranged a Free Balloon Race between the Army and the Navy, to start from St. Louis, U.S.A., on Sept. 26th. Six balloons have been offered—three for the Army and three for the Navy. Final details have not been arranged, but there appears to be no doubt that the race will take place. So far as known, this will be the first free balloon race between Army and Navy officers ever held in America. Attempts will be made to establish both altitude and long-distance records.

THE "INTERNATIONAL AERIAL REGISTER."

The second impression of the "Aerial Register and Gazette" has now been produced. It is distinctly an elaboration of the first impression, and is to that extent more useful, and is now called "International," as it is aimed at bringing the British pilot before the notice of the foreign employer.

Obviously, some register of the technical personnel of aviation is necessary. Almost equally obviously, that "Register" should have been issued by the Department of Civil Aviation, so that anybody who is engaging a pilot—whether as a tester of new machines or for a 10 minutes' pleasure flight—should be able to refer to an Official Register and find out whether the pilot's record is such as to make him a trustworthy person. Similarly, anybody concerned with an aeronautical engineer—whether as a ground engineer at an aerodrome, or as a Government inspector of aeroplanes, or as an applicant for a position as a designer, or in any other capacity, should be able to refer to that "Register," and discover at once whether the man's record is such as to give confidence in his ability or in his opinions.

Similarly, Lloyds Underwriters and the Insurance Companies should be able to gauge a pilot's qualities in the same manner as that in which a ship captain may be turned up in the "Captains' Book."

As no official publication of this kind has been issued, naturally the opportunity arose for private enterprise to supply the deficiency, and this "Register" is the result.

Capt. Swinton, the compiler of the "Register," is an ex-officer of the Royal Engineers.

The difficulty of compiling such a "Register" was necessarily great, largely owing to the fact that the only people who were at all disposed to place their names in such a "Register" were those who were in search of situations, whereas, to be of the greatest use, a register of this kind should include all those who already occupy positions of importance, for these are the people whose names and records would really be of the greatest interest to possible purchasers of such a work.

From the beginning Capt. Swinton has been careful to point out that he is not running an employment agency, and does not pretend to find situations (though he has made very strenuous efforts to do so) for those who place their names on the "Register." It is refreshing to know, however, that his efforts have not been absolutely barren as salaries are actually being paid at the rate of some £8,000 or £9,000 per annum to registrants whom the "Register" has placed.

The fee charged for registration is certainly more than the sum charged for the insertion of a name in certain other registers and directories; but, no doubt, this is explained by the fact that whereas other directories embrace thousands of names, an aeronautical directory can at first only expect to number the names in hundreds. In any case, it is fairly evident that there cannot be any profit on the actual compilation of the "Register," and it is only fair to assume that so far as the registrants are concerned the proprietor of the "Register" is not making any money out of them. As a matter of fact, he has financed the undertaking to a considerable extent out of his own pocket. The profits—if any—will presumably be made from the sale of the book and from advertisements therein.

One may perhaps take this opportunity of stating clearly that THE AEROPLANE newspaper is not in any way concerned with this "Register," beyond the fact that it is published by the Aeroplane and General Publishing Co., and it has done its best to bring the existence of the "Register" before the aeronautical community in the belief that a directory of pilots and technical people ought to exist.

As at present arranged, each registrant is given a number on registering his name, and that number is discovered by reference to an alphabetical list near the end of the book. The second edition includes names up to No. 1,000. Following the numerical and alphabetical list of registrants there is a number of pages devoted to registrants' qualifications, such, for example, as knowledge of aerial photography, knowledge of aerial traffic management, knowledge of aerial equipment, acquaintance with various countries, knowledge of various languages and so forth, the registrant in each case being indicated by his number. In this way anybody desiring to engage a man with certain technical knowledge and a knowledge of a certain language can easily discover whether there does happen to be a registrant who combines the desired kinds of knowledge.

Naturally, the "Register," as it stands, is only a nucleus of what such a register should be, and one is somewhat in doubt as to whether it is actually the right kind of nucleus, but the book as produced is evidently the result of much hard and intelligent work. It certainly has already considerable value as a source of information, but before it can reach its highest value it must include, as already mentioned, those who are already occupying important positions in the Aeronautical Industry.

Capt. Swinton states that he hopes to bring out another edition in 1920 (published half-yearly) without any payment on the part of registrants, and to have their records supported either by an Air Ministry reference, or by a certificate of competency from the transportation concern employing them.

The permission of the Ministry has been obtained to publish lists of all registered aircraft, all pilots holding A.M. licences, and for the reprint of the Air Convention and other provisions for aerial navigation.

["The International Aerial Register and Gazette." Published for the proprietors by The Aeroplane and General Publishing Co., Ltd., Carey Street, W.C.2. xvi + 140 pp. Price 7s. 6d.]

CIVILIAN PILOTS REQUIRED.

A large aviation firm which has done a very great deal of passenger-carrying all over England this summer is advertising in this issue. They require pilots for commercial flying abroad. They should be not less than twenty-five years of age, with business experience and special knowledge of one of the following countries: Africa, Canada, China, Denmark, France, Holland, India, Italy, Japan, Mexico, Russia, South America, and the United States, etc.

Crossing The ts.

How the A.A. is extending well-known facilities.

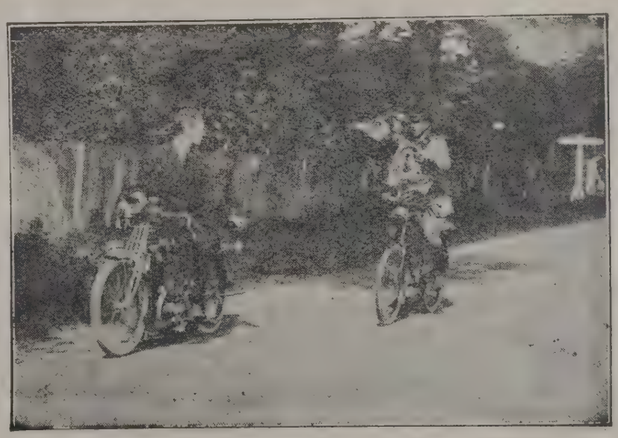
The Automobile Association places no reliance on the proverb "Leave well alone" in connection with its road service for members. Having successfully organised and provided a new benefit the Association

is not content to maintain it at the original level, but all the time endeavours to go one better.

The present season has seen marked activity in the Association's policy of progress, as is evidenced by the following 1919 Service refinements:

Road Patrol Scheme. "Mechanical First-Aid" Cycles fitted with side-cars, carrying spares and tools necessary for light repairs to cars or motor cycles, have been added.

Roadside Telephones. All the A.A. sentry boxes are being adapted for a 24 hour telephone service, and every member will be given a key which will enable him to use any of the instruments at any hour of the day or night.



Free Legal Defence. This benefit now covers Free Legal Representation in civil cases by the Association's solicitors in all approved cases arising from the sale, purchase or use of privately owned motor cars or motor cycles.

Foreign Touring Assistance. Members of the Association can now take their cars into a 70 per cent. tariff country on a banker's indemnity alone and without depositing hundreds of pounds in Customs dues.

Branch Offices. New offices have been opened at Oxford, Cambridge and Brighton, where members whilst *en route* can obtain road information.

Motor Fuel. The Association has commenced 10,000 and 5,000 miles road tests of "National" benzole on a Sunbeam car and a Triumph motor cycle, in order to prove once and for all that benzole of good quality is completely satisfactory as a motor fuel.

Complete information as to the objects of the Automobile Association and the many privileges it extends to members is contained in a new edition of "The Key to the Open Road," a copy of which can be obtained, post free, from the Secretary, A.A. & M.U., 41, Fanum House, Whitcomb Street, London, W.C.2. Send a postcard to-day. Motorists in London who wish to join the Association without delay are invited to call at Headquarters, where a staff of experts is always in attendance ready to give information on any question relating to motoring.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

In a leading article Captain Sayers draws attention to the neglect into which seaplane design has fallen of recent years in this country.

The lamentable exhibition in the Schneider Competition at Bournemouth on the 10th of this month serves to point the moral—even if it scarcely adorns the tale.

Machines produced during the war by the firm of Frederick Sage, Ltd., form the subject of this week's instalment of Modern British Aeroplanes.

Illustrations of certain German machines of more or less experimental types serve to show the profound effect which the Sopwith Triplane produced on the German mind.

This particular case is a typical example of the German method of seizing upon a new idea of extraneous origin and diligently investigating its possibilities.

So far as can be discovered Germany produced many more different types of triplane than all the rest of the belligerents combined, yet—with the possible exception of the Fokker—none of these equalled the original Sopwith.

A somewhat delayed account of a lecture by Lt.-Col. H. G. Lyons, read at a Joint Meeting of the Royal Meteorological Society and the Royal Aeronautical Society is published in this issue as being *apropos* the Schneider Cup weather.

THE NEGLECTED SEAPLANE.

By Capt. W. H. SAYERS, late R.A.F.

Great Britain has been known to be an island for some appreciable time. One Julius Cæsar placed the fact on record—*circa* 55 B.C.—and it seems possible that others were aware of it even earlier. As the files of the "Times" or its equivalent of those days are unfortunately no longer extant, it is impossible to state whether the importance of the matter was properly realised in those days.

Some 900 years later a certain Alfred—a sort of Lord Fisher of that era—certainly awoke to one aspect of the matter and founded the British Navy. It is also true that he burnt the cakes, and that the tradition which he thus initiated is to be found reflected in the execrable cooking which survives in the Senior Service to this day.

However, it is now over 1,000 years since Alfred the Great discovered that England's defensive frontier was to be sought upon her enemies' coasts, and it may therefore reasonably be hoped that within the next century or two one will arise who will combine, as Alfred did, both vision and authority, and who will realise that, although the advent of the airship and the aeroplane has profoundly modified the details of defence, it is still as true as it was 1,000 years ago that Britain's frontier in war should be the coastline of her enemies.

It has been stated often that the aeroplane has destroyed, or is about to destroy, the defensive value of the British Navy. It is even believed that THE AEROPLANE has on occasion expressed views which have been generally interpreted in that sense.

A very little reflection will serve to show that it is as absurd to suggest that aircraft can supersede a sea-going navy as that they can supersede an army. It is conceivable that some future wars may be fought almost entirely in the air.

Nevertheless, any type of aircraft must have some sort of base upon the Earth's surface, and that base must have protection against enemy attacks by land as well as by air.

Thus, even if the aerial arm attains that supremacy in warfare that some of its advocates proclaim, the aerial arm will still need a terrestrial protecting force from behind whose lines it will draw supplies.

For the British Empire, even more than for the British Isles, the lesson of history is clear. If the British Air Force is to take its place in the Empire's defensive system, it must be an Air Force which is based upon the sea, immediately behind the British Navy.

True, the few odd miles of ditch which separate Great Britain from the Continent are a relatively small matter where aircraft are concerned, but even here it were better to use that ditch over which to fight any future attempts at invasion rather than leave the business to occur over an equal depth of British land.

But, taking the Empire as a whole, there is question not of a few miles of water, but of thousands of miles of it, and the Imperial Air Fleet of the future—if it is not to be a mere coastguard affair—must be a High Seas Air Fleet.

To Britain land-going aircraft have a certain importance. There are a few land frontiers of the Empire exposed to the incursions of barbarous peoples, and land machines should be useful for police purposes in such places.

But sea-going aircraft—not merely aircraft able to cross hundreds and thousands of miles of sea, but aircraft which can use the sea as an aerodrome and a supply ship as a base—are essential to its continued existence, unless it be true that the millennium is at hand.

The late war was fought on land. The navies of the belligerent Powers were too frightened one of another to attempt to hold the open seas, and the coasts of the opposing nations were too close together to force the development of real marine aircraft, and Britain in particular has lost an unparalleled opportunity of developing what will become the basis of air power in the future.

Few things are quite so surprising in the history of the late war as the relative stagnation of seaplane development in this country. When war broke out, Britain possessed, in the Sopwith Schneider Cup winner, the fastest seaplane in the world. In the Sopwith "Bat-Boat" she had the original of the N.C. type which made the first flight across the Atlantic, and, in the Short seaplanes of that date, a type of general-utility seaplane unequalled by the products of any other country.

At the cessation of hostilities, after four and a half years of the most amazing progress in aeroplane performance, the only small high-speed seaplane which the Royal Air Force had possessed in any quantity was the original Sopwith Schneider with a somewhat more powerful engine. The only version of the "Bat-Boat" type that those four years have produced was a feeble effort of the Royal Aircraft Establishment, and the only moderate-sized seaplanes which had been made to any large extent were Shorts—practically unaltered in design since 1914.

One very important development did occur in that period. Whether it was pure joss, or whether it was that Wing Commander (since several other titles which memory fails to recall) J. C. Porte's naval training had taught him the right methods by which to attack the powers that were at the Admiralty—or whether it was mere persistence and perseverance on his part—Felixstowe was permitted to carry on with the work of developing the big flying boat to the extent of making a success of it and of getting it into production on a really large scale.

The big boat enthusiasts, who are not a few, will point to this fact as an indication of the essential soundness of the British seaplane policy.

As a matter of fact, it is nothing of the sort.

In the first place, speaking from a very intimate knowledge of the facts, there never has been any policy that has lasted more than three months on end.

In the second, without any kind of reflection upon the excellent work carried out at Felixstowe—carried out under conditions which only a small number of people who have attempted similar experimental work under the ægis of the late Air Department, Admiralty, can guess at—Felixstowe was in effect given a monopoly in that particular branch of experimental work. Had any of the competent designers who were willing to attack big seaplane design been decently encouraged, their efforts would at least have improved the Felixstowe breed of boat, had they done nothing else.

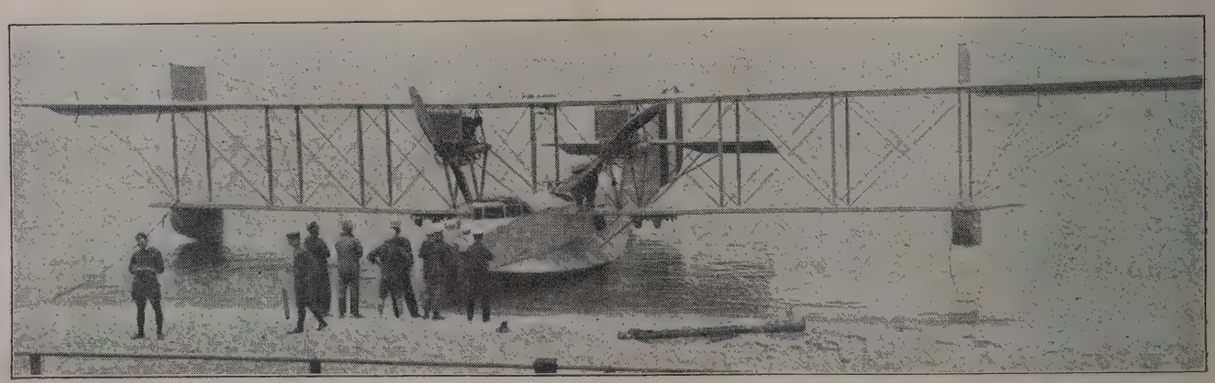
But the big boat is not the only type of seaplane, whether for war purposes or for the uses of peace.

The little Brandenburg monoplanes, which shot down our big boats 20 miles from their birthplace, are sufficient evidence, so far as war is concerned—just as they are evidence that the Germans had digested, as we have forgotten, the truth that Alfred the Great recognised a thousand years ago.

The flying-boat type of seaplane may or may not prove to be the only really seaworthy type of aircraft for trans-marine work. That question need not now be discussed.

The fact that is to be insisted upon is that, since 1914, nothing has been done officially to encourage the development of seaplanes, with the single exception of the large boat type.

This is in no way the fault of seaplane-designers. If it were possible to publish a list of specifications issued by the Air Department of the Admiralty during the course of hostilities, for various types of seaplane, and of the machines which were designed and produced to those specifications, together with their ultimate fate, and one or two other relevant matters of history, it would make an extremely interesting, though rather melancholy, story.



The Schneider Cup fiasco of Sept. 10th by no means tends to dispel the gloom in which war has shrouded the seaplane. It is true that Janello on the Savoia boat with the Isotta-Fraschini engine ran his full ten laps of the course—for even if he did not round the mark-boat in Swanage Bay he made up for that omission by his coast-hugging course west of Bournemouth—with clock-like regularity at just upon 130 miles per hour, and that Capt. Hammersley, on the left-out Avro, had the speed of Janello by not less than 20 miles per hour on his time for the exhibition laps which he flew.

But all these were merely aeroplane performances. The sea at Bournemouth on the day of the race would not have sunk an eggshell—and the beach there is as nearly perfect for beaching seaplanes as any that can be found in Britain.

Yet of seven machines built by three great nations for a seaplane race, only three, and one not a competitor, survived the day with unpunctured floats, and of those three one only actually passed the landing and getting-off tests imposed by the rules of the race.

There is in this country a certain number of people who have had some experience of seaplanes in practice, and who do know that a seaplane which has to alight at 80 miles per hour needs something rather extraordinary in the way of float bottoms if she is to alight undamaged with fair certainty even on a sea like a millpond, but most of them have been driven out of the industry, and none of them appear to have had any say in the arrangement of the contest.

Thus it happens that after four and a half years of war use of seaplanes the International Seaplane Race produced mainly a number of high-speed land machines on floats, and Britain—which should be the home of the seaplane—made as sorry a show as any competitor.

The Curtiss H.16. A big American twin-engined boat which has many resemblances to, and a common ancestry with, the British F. boats.

MODERN BRITISH AEROPLANES.

XV.—Frederick Sage & Co., Ltd.

The aircraft branch of Frederick Sage and Co., Ltd., the well-known firm of shop fitters and furnishers was begun at the request of the Admiralty early in 1915, and for a time machines of outside design were constructed.

In Sept., 1915, Mr. E. C. Gordon England joined the firm as pilot and consultant, and a few months later he was put in charge of the aeronautical department of the firm. In Jan., 1916, Mr. Clifford W. Tinson was permitted by the Director of Air Services to leave the Air Department of the Admiralty and join the firm as designer.

From that time Messrs. Sage have produced a number of machines of their own design, besides turning out in quantity sundry types of independent design, together with large quantities of spare parts.

An airship section was also formed shortly before the aeroplane department and built large numbers of cars for non-rigid airships.

THE SAGE II.

Sage I was an experiment which was not finished.

The Sage II was designed as a two-seater fighting scout, at a time when the synchronised gun was an experiment.

The pilot was seated in front and the gunner by standing up behind the pilot could fire a Lewis gun through a hole in the top plane.

Both pilot and gunner were enclosed in a streamline fairing extending upwards from the cockpit to the top plane.

Further developments of this machine were not proceeded with as the Constantinescu synchronised gun gear made the type unnecessary.

SPECIFICATION

Type of machine	Two-seater tractor biplane
Name or type number of machine	Sage 2
Purpose for which intended	Fighting scout
Span	22 ft. 2½ in.
Gap, maximum and minimum	5 ft. 6 in.
Overall length	21 ft. 1⅝ in.
Chord	top, 5 ft.; bottom, 2 ft. 8 in.
Total surface of wings	168 sq. ft.
Total area of tail	20 sq. ft.
Area of elevators	14.5 sq. ft.
Area of rudder	9 sq. ft.
Area of ailerons	25 sq. ft.
Engine type and h.p.	100 h.p. Gnôme
Weight of machine empty	946 lb.
Load per sq. ft.	9.2 lb.
Weight per h.p.	15.46 lb.
Tank capacity in gall.	petrol, 27½ gall.; oil, 8 gall.
PERFORMANCE—	
Speed low down	112 m.p.h.
Speed at 10,000 ft.	109.75 m.p.h.
Landing speed	55 m.p.h.
Climb—	
To 10,000 ft. in min.	14.75 min.
Total weight of machine loaded	1,546 lb.

THE SAGE III.

The Sage III was designed at the request of the Admiralty as a two-seater, dual-control, primary training land machine, the principal requirements being ease of handling, slow-landing speed, and good visibility.

A large order for this machine was given, but was cancelled in order to allow the firm to concentrate on the production of fighting seaplanes.

SPECIFICATION

Type of machine	Tractor biplanes
Name or type number of engine	Sage 3a and 3b
Purpose for which intended	Training
Span	34 ft. 6 in.
Gap, maximum and minimum	5 ft.
Overall length	32 ft. 10 in.
Chord	4 ft. 9 in.
Total surface of wings	330 sq. ft.
Total area of tail	26 sq. ft.
Area of elevators	24 sq. ft.
Area of rudder	10 sq. ft.
Area of fin	4 sq. ft.
Area of ailerons	72 sq. ft.
Engine type and h.p.	75 h.p. Rolls-Royce "Hawk"
Weight of machine empty	1,390 lb. (3b)
Load per sq. ft.	6.25 lb. (3a), 6 lb. (3b)
Weight per h.p.	23.9 lb. (3a), 26.4 lb. (3b)
Tank capacity in gall.	petrol, 26 gall.; oil, 4 gall.
PERFORMANCE—	
Speed low down	72 m.p.h. (3a), 76 m.p.h. (3b)
Landing speed	39 m.p.h.
Total weight of machine loaded	2,064 lb. (3a), 1,980 lb. (3b)

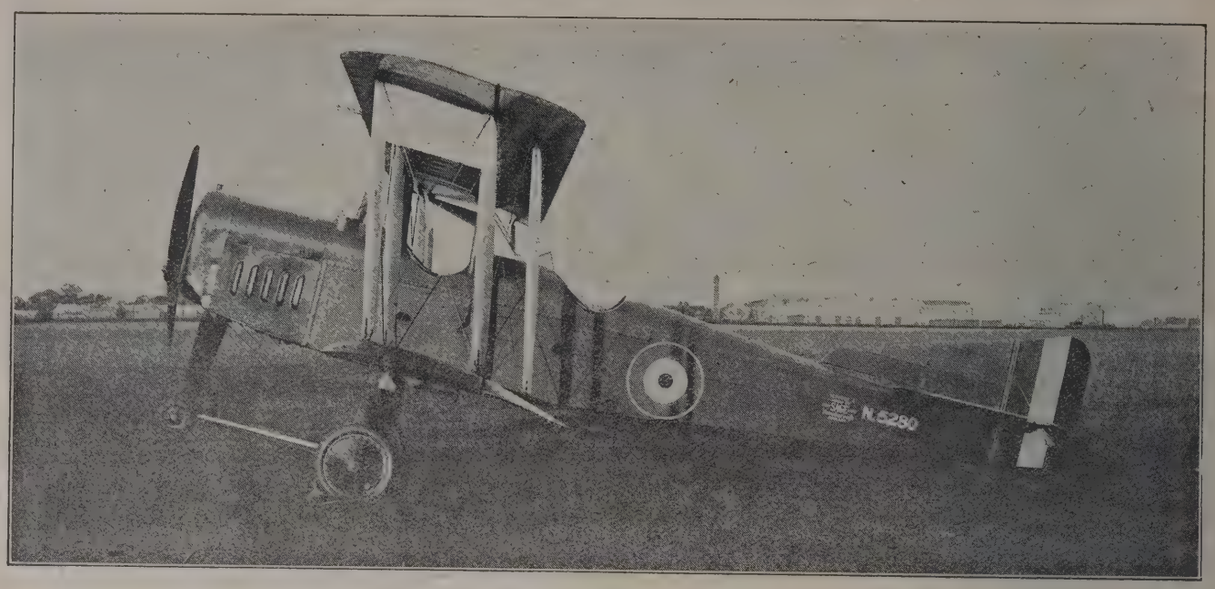
THE SAGE IV SEAPLANES.

The Sage IV Seaplane—produced in July, 1917—was very similar to the Sage III type, with a float undercarriage instead of wheels.

The machine was a two-seater, intended for wireless patrol work at sea, with a 140 h.p. Hispano-Suiza and in the hands of the late Capt. Gordon Bell, put up an excellent performance on test.

Subsequent types were altered to take the 200 h.p. Hispano-Suiza engine and fitted with dual-control. The training machines thus derived were called Sage IVb and Sage IVc, the former having fixed planes, and the latter folding planes.

These machines were extremely maniable, and just before the signing of the Armistice, the Sage IVc was used for a course of intensified training at seaplane training stations.



THE SAGE TYPE IVa.

SPECIFICATION.

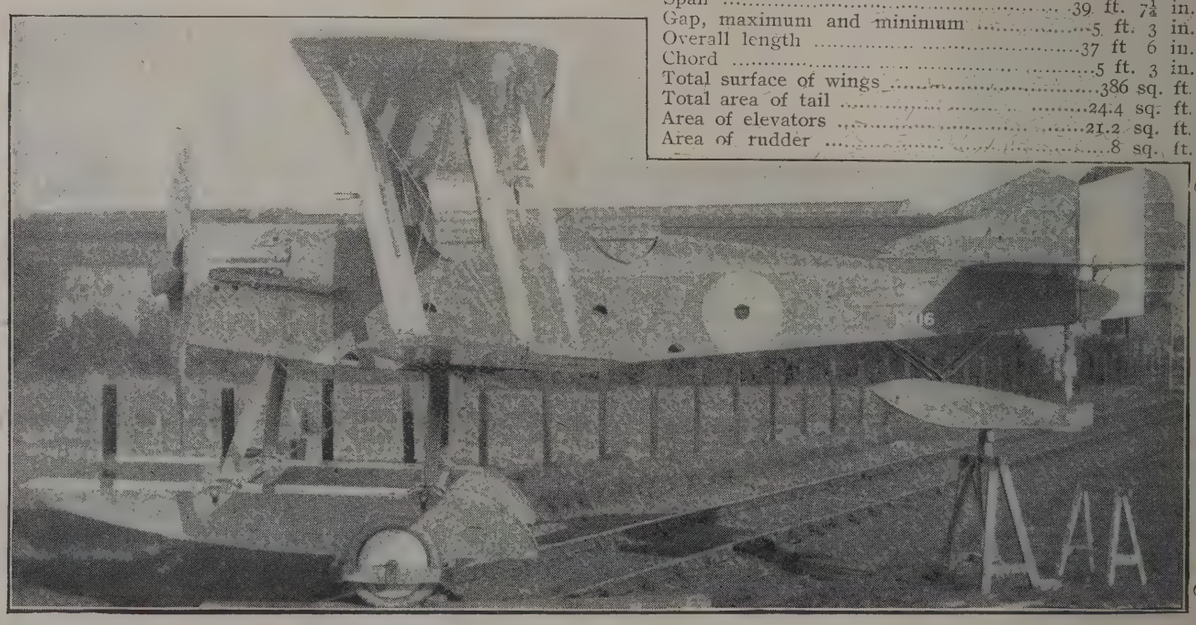
Type of machine	Tractor float seaplane
Name or type number of machine	Sage 4a
Purpose for which intended	Training

The Sage II Fighter, with enclosed cockpit and gun-hole in the roof (100 h.p. Gnôme engine).

The Sage III Training Machine (Rolls-Royce "Hawk" 75 h.p.).

Span	34 ft. 6 in.
Gap, maximum and minimum	5 ft.
Overall length	32 ft. 6 in.
Chord	4 ft. 9 in
Total surface of wings	330 sq. ft.
Total area of tail	26 sq. ft.
Area of elevators	24 sq. ft.
Area of rudder	10 sq. ft.
Area of fin	4 sq. ft.
Area of ailerons	72 sq. ft.
Engine type and h.p.	110 h.p. Hispano-Suiza
Load per sq. ft.	8.06 lb.
Weight per h.p.	16 lb.
Tank capacity in gall.	petrol, 48 gall.; oil, 6 gall.
PERFORMANCE—	
Speed low down	83.5 m.p.h.
Speed at 10,000 ft.	79 m.p.h.
Landing speed	45 m.p.h.
Climb—	
To 10,000 ft. in min.	32 min.
Total weight of machine loaded	2,662 lb.

THE SAGE IVb SEAPLANE.



SPECIFICATION.

Type of machine	Tractor float seaplane
Name or type number of machine	Sage 4b
Purpose for which intended	Training
Span	34 ft. 6 in.
Gap, maximum and minimum	5 ft. 3 in.
Overall length	34 ft.
Chord	4 ft. 9 in.
Total surface of wings	330 sq. ft.
Total area of tail	26 sq. ft.
Area of elevators	24 sq. ft.
Area of rudder	9 sq. ft.
Area of fin	5 sq. ft.
Area of ailerons	72 sq. ft.
Engine type and h.p.	220 h.p. Sunbeam
Load per sq. ft.	8.2 lb.
Weight per h.p.	13.54 lb.
Tank capacity in gall.	petrol, 35½ gall.; oil, 4½ gall.
PERFORMANCE—	
Speed low down	95.5 m.p.h.
Speed at 10,000 ft.	85.1 m.p.h.
Landing speed	53 m.p.h.
Climb—	
To 10,000 ft. in min.	25 min.
Total weight of machine loaded	2,709 lb.

THE SAGE IVc SEAPLANE.

SPECIFICATION.

Type of machine	Tractor float seaplane
Name or type number of machine	Sage 4c
Purpose for which intended	Training
Span	39 ft. 7¼ in.
Gap, maximum and minimum	5 ft. 3 in.
Overall length	37 ft 6 in.
Chord	5 ft. 3 in.
Total surface of wings	386 sq. ft.
Total area of tail	24.4 sq. ft.
Area of elevators	21.2 sq. ft.
Area of rudder	8 sq. ft.

The Sage IVc Seaplane (Hispano-Suiza 200 h.p.)

SAUNDERS

Designers and Constructors of MILITARY and COMMERCIAL AEROPLANES, and NAVAL and COMMERCIAL SEAPLANES and FLYING BOATS.

Sole Manufacturers of the famous Sewn "CONSUTA" PLYWOOD, the lightest and strongest material yet evolved for Aircraft construction.

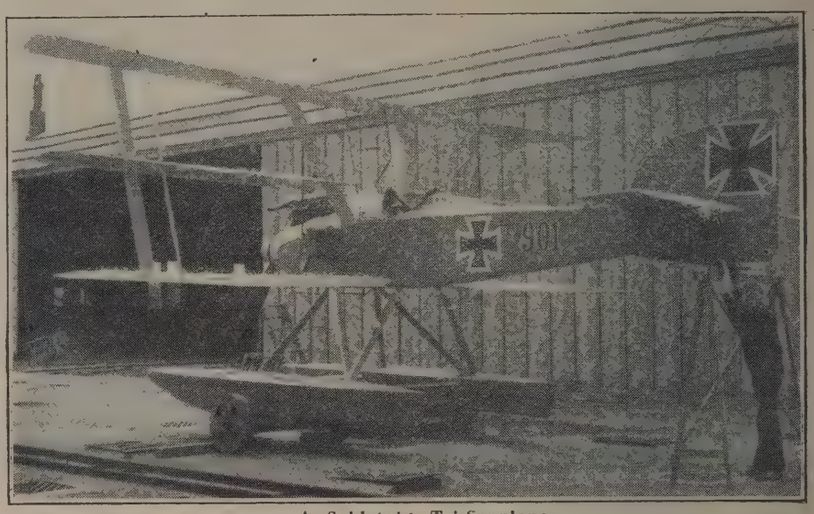
To 10,000 ft. in min.	21.44 min.
Total weight of machine loaded	2,875 lb.

Fredk. Sage, Ltd., do not propose to abandon their Aircraft Department on the cessation of hostilities, but intend to play a part in the development of civil aviation in the future.

To that end they are prepared with a series of designs for post-war types, ranging from a single-seater sporting model of 45 h.p. up to a big 1,200 h.p. 24-seater seaplane for long-distance work, and are, doubtless, prepared to undertake the design of special types for particular purposes.

SOME GERMAN TRIPLANES.



It is fairly well known that the Sopwith Triplane during 1917 produced a very considerable moral effect upon the German Air Service—in addition to the very substantial material losses which it inflicted.

It is also fairly well known that it produced by way of reply the Fokker triplane.

The three experimental triplanes shown on this page never reached any of the fighting fronts so far as can be discovered, but they serve to show how thorough and painstaking an experimentalist the German is.

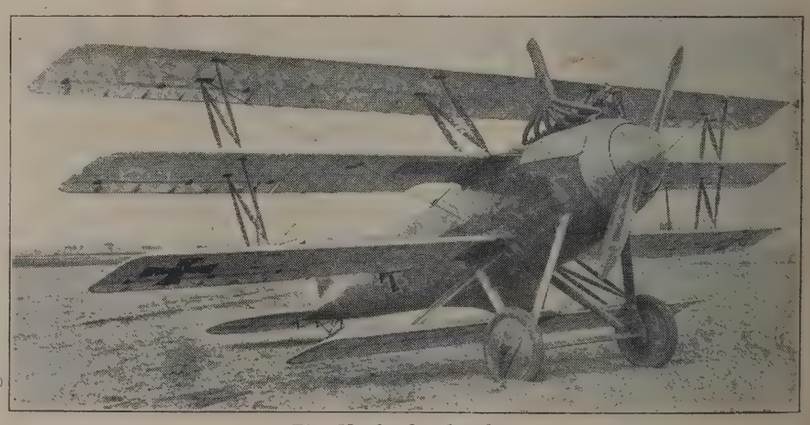
Of the machines illustrated the little Sablatnig seaplane shows the most obvious signs of Sopwith influence—it is in fact a Sopwith triplane fitted with a stationary engine and has long floats without a tail float.

The second picture is a product of the Schütte-Lanz firm, and the last of the illustrations shows a machine produced by the Naglo Werke—actually a hybrid quadruplane.

A Sablatnig Tri-Seaplane.

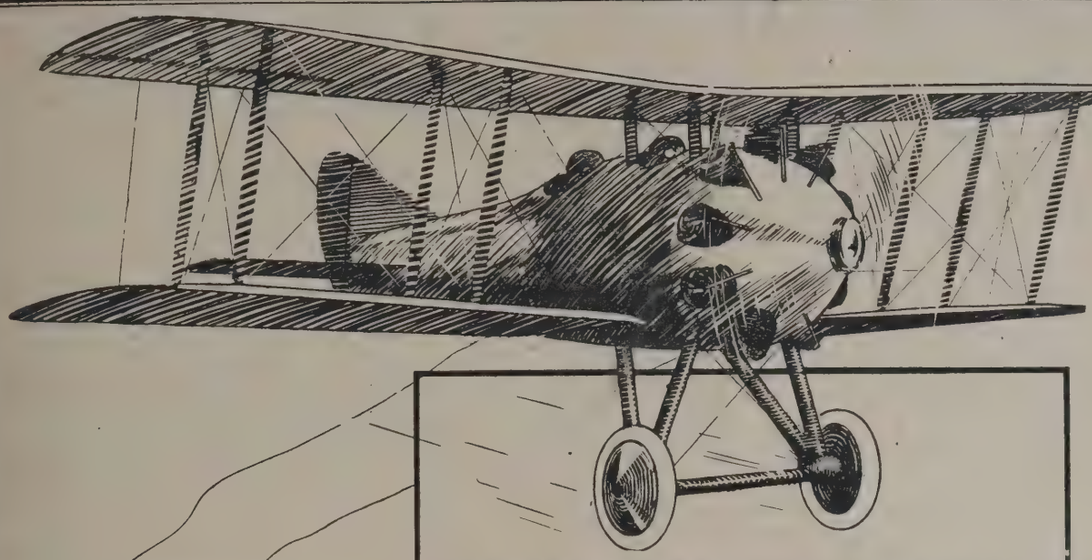
The Schütte-Lanz Triplane.

Both show the curious German hankering after novel and rather complicated structural work in their strut arrangements.



In addition to the machines illustrated, small single-seater fighting triplanes of Roland and Pfalz design were produced at about the same time.

Of these the Pfalz was fitted with a rotary engine—probably the Siemens-built 11-cylinder of 200 h.p. and the Roland with a 6-cylinder vertical—apparently a Mercédès.



Both the Pfalz and the Roland triplanes have an upper wing of considerably greater chord than the two lower wings, though all three wings are in both cases of nearly equal span.

The Pfalz strutting arrangement to meet these conditions is in the form of a Y—one single strut connecting the lowest and centre planes and a Nieuport type V above connecting the top and centre planes.

In addition to single-seater machines, quite a number of larger machines have been built on triplane lines. Both the Gotha and the Freidrichshafen concerns have produced large twin-engined triplanes, and recently the Hannover Wagen Fabrik have turned out a three-seater limousine triplane which is possibly a converted war machine.

The Naglo Quadruplane.

TRANSITIONS IN TRANSIT

No. 6.—The Continental Tour.

"The Continent"! What visions that magic word conjures up. And how strangely it brings into focus that little strip of salted wilderness we call the "Channel." To most folk the crossing of that strip is the one fly in the Continental ointment. Few indeed are those who do not approach it with apprehension—and vivid recollection!

But such troubles are *non est* to the air tourist. To him, the crossing means twenty minutes of smooth swift flight. And then what splendid vistas await him. The fertile valleys of France, the sunny grandeur of Italy, the snow-clad peaks of Switzerland—wondrous visions from the point of view of the joy-hunting bird-man.

He is, as it were, in a little world apart; far from the troubles that beset the earth-t ed tourist.

Illustrated above is the Nieuport "Nighthawk" sporting machine.

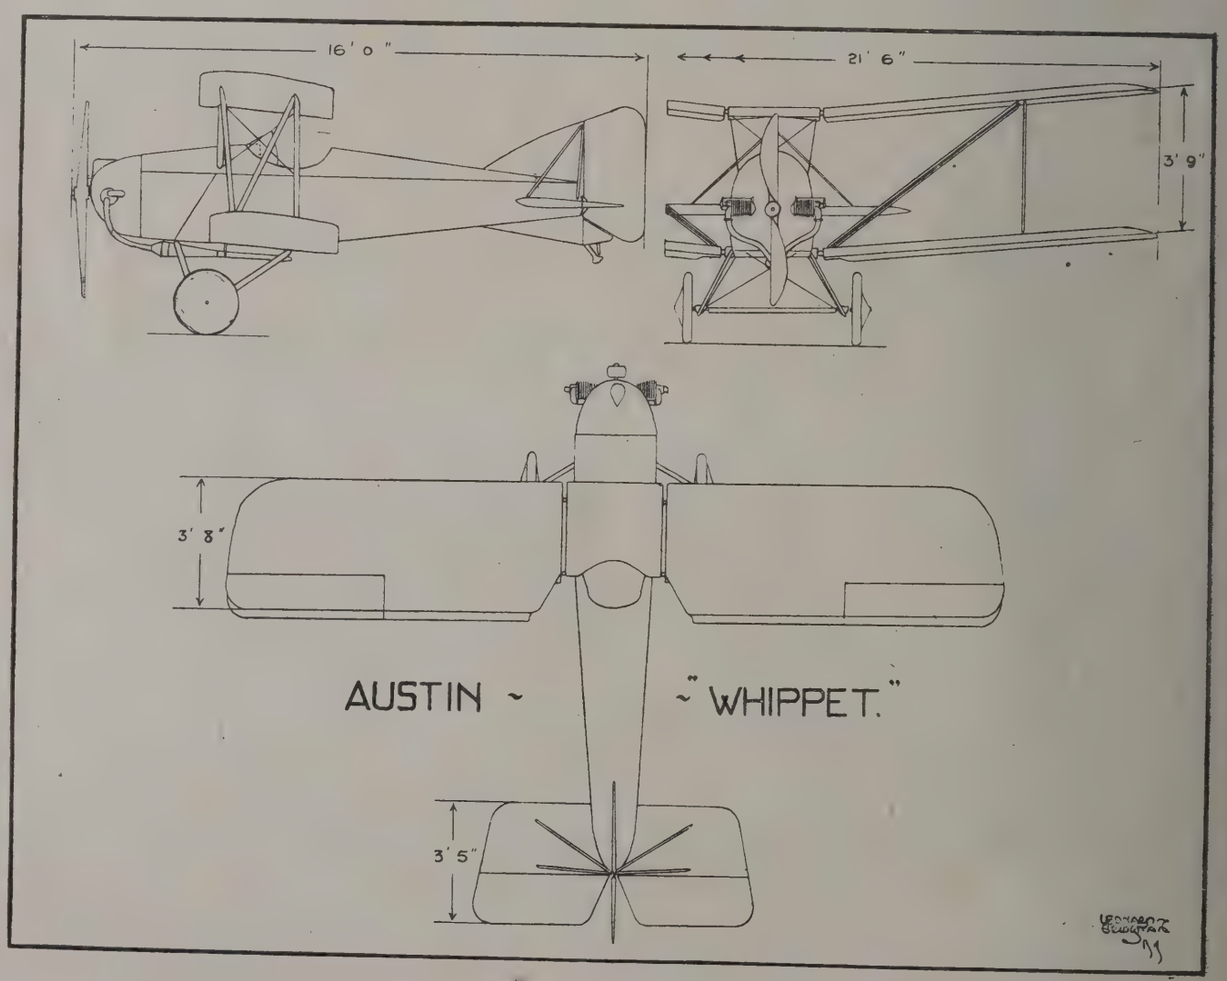
THE AUSTIN "WHIPPET."

The Austin Motor Co., Ltd., of Northfield, Birmingham, have, during the late war, produced large numbers of aircraft and aero engines of standard design, and also some machines of their own design for war purposes, which have performed well.

Since the Armistice they have brought out a small biplane, known as the "Whippet," which is intended purely as a sporting machine. To meet the requirements of a private owner who is fortunate enough to be able to run an aeroplane, the "Whippet" has been very carefully designed to be simple to fly and also to keep itself in flying order and to be housed in the smallest space possible.

The "Whippet" is a small, single-seater, tractor biplane, with a wing span of 21⅓ ft. and an overall length of 16 ft. The fuselage and undercarriage are of steel construction, and in place of flying wires streamline tubes are used. It will thus be seen that frequent re-rigging is unnecessary.

The Austin "Whippet" (45 h.p. Anzani).



For storage purposes the wings are made to fold by releasing four locking bolts, bringing the span down to 9 ft.

The fuselage is made in two parts, the join being just in rear of the pilot's seat.

The main planes are built up in the usual fashion with hollow box-section spars and steel tube compression members, the whole wire-braced. One set of steel tube N struts are fitted either side of the fuselage, the steel "flying" tubes being fitted to the top of the interplane struts and the roots of the lower wing, so that they are not disconnected when the wings are folded. Ailerons are fitted to both upper and lower planes, and are interconnected by a steel strut. In the scale drawings a 40 h.p. A.B.C. "Gnat" engine is shown, but a six-cylinder 45 h.p. Anzani engine has been installed in the actual machine. The Anzani engine is overhung on the front of the fuselage and has a rubber shock-absorbing device fitted between the engine bearer and the fuselage.

The tail unit has fin area both above and below the fuselage. The tail skid is of the swivelling type, and is sprung by a spring inside a telescopic tube.

The machine has flown its tests successfully, and gave a speed range of 85—30 m.p.h., together with a climb of 5,000 ft. in 8 min. and 10,000 ft. in 18 min.

THE SUPPLY OF METEOROLOGICAL INFORMATION FOR AERONAUTICAL PURPOSES.

At a joint meeting of the Royal Meteorological Society and the Royal Aeronautical Society held some months ago, Lieut.-Col. H. G. Lyons delivered a lecture upon the subject indicated by the title above.

Limitations of space and the pressure of more urgent news has so far prevented the publication of this lecture, but the Schneider Cup fiasco has produced both the space wherein to print it and a practical illustration of the importance of the subject.

The LECTURER asked those present to indulge freely in criticism, as those who supplied the meteorological information were anxious to know the opinions of those who used it.

The following is an abstract of the lecture:—

The difficulties and risks of aviation are so greatly increased by unfavourable atmospheric conditions that the aviator is naturally strongly impressed by the importance to him of the best and fullest meteorological information that he can obtain; and he may be led to assume that the information that he requires must necessarily suffice for all other activities and all lines of investigations.

The truth is rather that the fullest meteorological information of all kinds is needed, so that it may be studied and worked upon by trained meteorologists in order that we may learn more of the principles underlying the phenomena that we observe, and from this standpoint be better fitted to advise aviators as well as all others to whom weather and climate are factors with which they have to be reckoned.

Though aviation makes probably larger demands on that part of meteorology which deals specially with weather, that is, with the short period changes of meteorological conditions, it does not thereby cover the whole field of meteorology any more than the chemistry required in the work of any branch of chemical industry necessarily covers the whole field of chemical science. The same phenomena which are of importance in aviation are among those which the meteorologist studies for the progress of his science. The interest and the importance of the force and direction of the wind at various altitudes above the surface of the earth, which are observed by means of pilot balloons, shell-bursts, and other methods, are not limited to the aviator alone.

The forecaster needs them in his work, in gunnery they are carefully observed and utilised, the meteorologist in his study of the physical conditions of the atmosphere requires them as data from a region where friction with the earth's surface, and heating and cooling of the air by convection, do not complicate the problems with which he has to deal. It is indeed impossible to say that any particular meteorological study is unnecessary or useless for aviation, for gunnery, or for any specific application of meteorological science.

OBSERVATIONS AT VARIOUS ALTITUDES

Measurements of wind, temperature, humidity at various altitudes, taken with all the precision that can be attained are indispensable to the meteorologist who is seeking the principles which underlie the phenomena that we observe, and which, when determined, represent a definite advance in our knowledge and thereby in our powers of practical application.

Observations made in one line of investigation will often, in practised hands, lead to advances in knowledge which are of the utmost importance in their application in quite different fields. Thus the observations which Major G. I. Taylor, F.R.S., made in 1912 on board s.s. "Scotia," which was chartered for studying the distribution of drift ice in the North Atlantic, have led him to most important advances in our knowledge of eddy motion in the atmosphere, which has thrown light on the conditions which determine the formation of mist, fog and low cloud, thus materially advancing our knowledge of a part of one subject which is of supreme importance to the aviator.

All meteorologists have long recognised that the weather of any particular region is only the local result of causes which belong to the general circulation of the atmosphere, so that a collection of the meteorological data of the globe was a first necessity.

THE RÉSEAU MONDIAL.

This is being provided in such a form as can be produced at present by the publication of the Meteorological Office, the "Réseau Mondial," in which the pressure temperature and rainfall for each month at a number of selected stations, two for each ten-degree square being taken wherever possible. This publication of which three years, 1911, 1912, 1913, have appeared, is only possible because of the uniformity and co-operation which has been achieved by international effort.

The next point for consideration in the supply of meteorological information is that for one special class of that information rapidity of transmission is of the highest importance.

That division of meteorology which deals with weather is primarily concerned, at least in extra-tropical regions, with the changes which take place from hour to hour and from day to day; and these changes take place often with great rapidity and spread quickly over large areas, so that if they are to be anticipated and warnings issued of such coming changes as little time as possible should be expended in the collection of reports and the issue of forecasts and warnings.

In this country forecasts have long been prepared thrice daily, from observations at 7 a.m., 1 p.m., and 6 p.m., but with the increase of aviation during the war and the necessity for the issue of forecasts of the weather at an hour before the day's plans for operation were under consideration, an additional forecast and report based on observations at 1 a.m. was introduced, and has been continued up to the present time.

For years past the meteorological services of most European countries, as well as those of India, Canada, the United States, Egypt, Japan, and some others have issued daily weather reports and maps of their area and of the surrounding regions, interchanging information by telegraph under international agreement. Europe was in this way fairly well provided with information of current weather from a large network of stations, to which were added in 1909 reports from ships of the trans-Atlantic steamship lines.

Under present conditions these international services can be and have been for the most part resumed, but the new demands for a quicker and more frequent supply of information are much larger and more numerous than those of five and six years ago. The forecaster must now receive his reports within an interval of not more than an hour after the observations have been taken and for them to be utilised to the full, his deductions from them should be available half an hour later.

THE DAILY WEATHER REPORT.

The daily weather report which was issued before the war from the Meteorological Office was a document which had grown up gradually and by successive changes. It had been the rule to publish with the map the statistical material which had been used in its production, so that the reader could check its correctness, and, if he pleased, draw his own deductions from it.

But under Service conditions something simpler, plainer, and more direct in its presentation of the opinions of the trained meteorologists who prepared it, was needed. Those who had to make use of the daily weather reports were usually far too busy to wish to study the statistical material before accepting the meteorological opinions which were offered to them.

They wanted a direct statement of expert opinion of which they could make use in preparing their own plans of actions. The desire for such expert assistance was also shown by many requests that forecasts should be expressed in "perfectly simple and non-technical language." To this very reasonable request it was not so easy to accede to as it may seem.

Such expressions as "a depression advancing from the westward," "a secondary depression developing over the Channel," "an anti-cycione spreading northward," are more than mere statements of fact; they convey to all who are acquainted with meteorology much additional information depending on the weather conditions described, which it would take several paragraphs to describe simply and in non-technical language.

Now that hostilities have ceased, the opportunity has been taken to revise the daily weather reports in order to make them more useful and more convenient for reference. The simplified morning report of war days has been transformed into a British daily weather report, in which all the information from the United Kingdom is included, and is issued before noon. Later in the day an International daily weather report is issued, in which all the data from foreign countries appear. In addition, a special two-page supplement, containing all upper air observations from the observatories of the Meteorological Office and meteorological stations of the Air Ministry as well as from some in France, is published daily at noon.

WEATHER MAPS FOR THE BRITISH FORCE IN RUSSIA.

Whenever forecasts have to be prepared, reports from many stations must be collected and a weather map drawn; and if drawn it should be issued to all whom it can reach in time. Thus on every war front, daily weather maps have been regularly issued, often several times daily, and at this moment one is furnished to the British Force in North Russia; and in all future operations the same will be required. This intimate co-operation between the different meteorological services which aviation necessitates, increases the importance of Imperial and international consultation, in order that information may be provided on all routes, and at all stations as nearly as practicable in a common form, and with the least possible delay.

Now that meteorological records are being more largely worked upon and will continue to be worked upon in the future, it is of the highest importance that there should be at a central institute as complete a collection of them as possible. Also, that at that institute, an highly efficient system of registration and indexing should be in operation so that inquirers and students may be referred readily to all sources of information, whether published matter, manuscript records, or investigations that have been carried out and then filed away. The last group is not the least important, for work of this kind may be needlessly repeated unless there is a ready reference to what has already been done.

There is a large amount of information of such statistical

character published in this country already; weekly and monthly weather reports of the United Kingdom appear regularly; but for the war the climatological atlas of the United Kingdom would have been published by the co-operation of the Meteorological Office and the Royal Meteorological Society. Pilot charts of the North Atlantic and the Indian Ocean appear monthly, and contain much information relating to these ocean areas, which have been collated from the valuable meteorological logs contributed by ships' officers.

A NETWORK OF METEOROLOGICAL STATIONS.

The British Empire possesses a very numerous and widely flung network of meteorological stations, numbering about 1,000 in all, besides those which record rainfall only, and the ships which keep meterological logs; these stations are organised under the meteorological services of this country, of the Dominions, of India, and of the Crown Colonies, so that they furnish us with opportunities for investigating almost any problem that may arise in meteorology, if competent meteorologists make full and proper use of them.

Bermuda, the Windward Isles, St. Helena, Ascension Island, the Falkland Islands, and South Georgia, provide a chain of stations from which, although they are not quite so conveniently situated as could be wished, the meteorological conditions over the Atlantic Ocean may be investigated, and the supplementary observations taken on sea-going steamers can be controlled. Their results can be compared with those which the islands of the Indian Ocean can provide, viz., Socotra, Seychelles, Mauritius, and Keeling Island, or again with those from the numerous islands of the Pacific.

Africa has been mentioned as the site of two air routes, and here there are many subjects of great meteorological interest. The Egyptian and Sudan Service has, during 15 or 16 years of its existence, thrown much light on the conditions prevailing over North-Eastern Africa.

NATIONAL CO-OPERATION.

National co-operation offers fewer difficulties in the way of uniformity, but in so widely distributed an Empire as ours local conditions vary so widely that more points of difference arise than would occur in a more compact geographical location. Conferences of the directors of all the various British meteorological services are the natural means for obtaining greater co-ordination, and to some extent these have been provided by the periodical International Conferences of Directors or meetings of the International Meteorological Committee. There are, however, greater advantages to be gained from Imperial meteorological conferences which can easily be held just before the international meetings. The present time is very suitable for such a conference and it is to be hoped that nothing may prevent it from being held at an early date.

DISCUSSION.

Maj.-Gen. BROOKE-POPHAM said the information to be got in France during the war as regarded meteorology was of the greatest possible value. They tried to do without a special meteorological service when the war started, but it was found absolutely necessary to have a local service, and it was started early in 1915.

In a short time the information received from it was quite remarkable for its accuracy, and they could not have done without it. The most important thing from the aviation point of view was that the information had to be got through very quickly.

Conditions were somewhat different now from those that prevailed in France. The local meteorological service there only concerned a rather small area of the world. In future the area the service would have to cover was vastly greater, and it might concern—as it did at present—the whole of the Atlantic, the North Sea, and right away to Egypt.

He thought that would rather introduce complications, and alter the conditions of the service that would be required. Col. Lyons said the information was got out at present by maps and particulars that were printed in the maps, but he thought in future they would have to have it by telegram if it was going to be of real value.

In France they had a regular code system. Something like that would have to be evolved for civil aviation. Using a code would reduce the length of the telegrams and increase the rapidity with which the information would be got out.

LIEUT.-COL. OGILVIE'S COMMENTS.

Lieut.-Col. A. OGILVIE said the lecture was one of the most stimulating to the imagination that he had heard for a long time. The vital point as regarded civil aviation seemed to be the fact that it would depend upon the weather. One could see no serious difficulty in the construction or operation of the machines. They might be a little bit expensive to work at first, but the thing in which it was really difficult to see the complete path open ahead was the meteorological question, and that lecture showed a sort of line of development which was coming.

Such difficulties as the weather presented were going to be particularly applicable in this country, where the weather was very bad. That was really an advantage. The weather conditions being very bad, the subject became so serious that one had to get after it and put it right. It was the same with regard to the pilots. He remembered Wilbur Wright telling him in 1908 that we should have the best pilots, as our particular conditions were so much worse than those of other countries that our fellows would have to be better than theirs to cope with them.

Similarly, as regarded the weather, the difficulties would be so great that we should have to develop systems and organisations, and study in every way meteorological questions, so as to enable us to operate at all. Two difficulties as regarded the weather seemed to be particularly prominent. The first was that of getting the knowledge of the conditions that were coming—such as fog, wind, and rain—and the second was the means of overcoming them.

Such a lecture as they had just heard did not enable machines to land in fog, rain, and so on, but it helped them to get the knowledge of where the fogs and rainstorms were going to be.

The Lecturer's remarks about the Nile struck him as being interesting, because some time ago he was messed up in an aeroplane expedition on the Nile, and those particular conditions were forcibly impressed on the minds of those concerned. Their machine did not do 120 miles an hour. Its maximum was quite 60, and it was not a particularly sensitive machine to any kind of weather conditions, and they were particularly sensitive pilots—he thought most of the old pilots were rather nervous and agitated people—and as soon as there were any gusts they used to hurry down.

They learnt after a considerable amount of experience that the wind was always blowing in an extremely steady way at certain times of the day. They got perfect flying weather from 7 to 10 in the morning, and from about 4.30 in the afternoon until it was dark. The wind during those times was blowing perhaps 30 miles an hour.

When they left Wadi Halfa at the beginning of the railway crossing the desert to El Hamid, although it was calm so far as the machine was concerned, it was going in a 30-miles-an-hour wind. Towards 10 o'clock or so the river appeared like a sheet of glass, but a little later, when the sun began to heat the ground, one saw ripples coursing over the surface of the river, and they knew that in half an hour or so those gusts would be coming up their way—they were going along at a modest 2,000 or something like that—and sure enough, after a decent interval after seeing those ripples, they began to "get the wind up" at the height at which they were flying.

On one occasion when they had to carry on till 12 o'clock the weather was horrible and the machine difficult to handle. He wished to emphasize the international nature of meteorological questions. Col. Lyons had expressed the matter very ably, but he would like to back up everything he had said. Aviation was not a thing one could do by oneself, and he thought it would probably have a very big effect on the whole inter-nationalisation of the world.

MAJOR WIMPERIS.

MAJOR H. E. WIMPERIS said the lecture by the honoured head of the chief meteorological service of this country must interest everyone connected in aviation. There were two sides to the meteorological work, ascertaining the best route, and supplying information which would enable one to judge what the weather was likely to be at the date one proposed to start to fly along the selected route.

For the latter the physics of the atmosphere had to be studied and problems as to the friction of fog and wind. It was difficult to get a continuous chain of observations in the upper air. Stationary balloons with observers attached were fascinating to meteorologists but rather deadly to aviators.

Lieut.-Col. H. T. TIZARD said the air conditions only became such that the meteorologists could deal with them in forecasts at fairly great heights, and as flights would probably be in future comparatively short and low forecasts could not be supplied with the rapidity and accuracy that would be of any use to aviators.

He thought the telegraph and telephone would be of no use for the purpose. A system of wireless should be established for this purpose, if necessary, by using continuous-wave wireless telegraphy for meteorological purposes and keeping other commercial uses to the ordinary wave telegraphy. Aviators should help the Meteorological Office by supplying the kind of information they required.

UNPLEASANT KITE BALLOONS.

Mr. J. S. DINES said he spoke rather as a member of the Meteorological Office than as representing the Meteorological Society. He was intimately concerned with the preparation of the reports Col. Lyons had talked about, and he emphasised how grateful they would be if the users of the reports would give them their opinions and criticisms.

They were asked to send reports by telegram and sent them regularly, but did not know whether they were quite what was wanted. If suggestions for their improvement could be made it would be of great service. What Major Wimperis said about kite balloons not being nice for airmen was true.

As Col. Tizard suggested, aeroplanes could take up thermometers and record the temperatures and in some cases get a fairly good idea of the drift of the wind at different levels. He hoped

To "Aeroplane" Subscribers.

HOW TO SAVE ONE GUINEA, EIGHT SHILLINGS & NINEPENCE OR SEVEN & SIXPENCE.

The subscription list of the AEROPLANE, both at home and abroad, is steadily increasing: an eminently satisfactory movement which we are anxious to encourage.

Of the many books published on the war on the Western front, none conveys a more realistic impression of the work of a particular arm than FLYING COLOURS by Captain H. M. S. Saundby, M.C., A.F.C., R.A.F., published at **£2 2s.** net (Edition de luxe) and **15/-** net (Popular Edition).

Among the art books published in the last year or two, none can claim to be a more faithful reproduction of the artist's colour scheme and that indefinable thing, atmosphere.

FLYING COLOURS is a permanent memorial of the life of "the pilot in action," as Major-General C. B. Ashmore calls him. It was very costly to produce, and necessarily the price to the public had to be high.

Many would like to possess it who do not feel disposed to put down Two Guineas for the larger edition or Fifteen Shillings for the smaller.

How to meet their views? We make a special offer to any subscriber for one year to the AEROPLANE: namely to give him the right to purchase either edition at half price.

All he need do is to send us the accompanying order form with cheque for one year's subscription, plus **£1 1s.** or **7s. 6d.** according to the Edition he wishes to have.

In order to be fair to current yearly subscribers we extend the half-price concession to them also. If a subscriber has paid a quarterly or half-yearly subscription, then to secure the right to participate he should send the balance for the year.

Subscribers who have given their orders through the trade, and not direct to the AEROPLANE Office, must sign the form below or a copy thereof, and hand it with the balance on account of the book to their retailer for transmission to the AEROPLANE.

If the subscriber already has a copy of FLYING COLOURS, and would wish to take advantage of this offer, then he may secure McCudden's "Five Years in the R.F.C." **(7s. 6d.)**; Richthofen's "Red Air Fighter" **(3s. 6d.)**, and Gill's "The Aerial Arm" **(6s. 6d.)** at half price, *i.e.* **8s. 9d.** the three, plus the year's subscription to the AEROPLANE.

Subscribers who take advantage of this offer will have no reason to complain of the cost of their books.

ORDER FORM.

To THE "AEROPLANE,"
61, Carey Street, W.C.2.

Please send me the "AEROPLANE" or one year post free **(30/- inland; 35 - abroad** and one copy of the { Edition de luxe / Popular Edition } of FLYING COLOURS at half price { **£1 1s. 0d.** / **7s. 6d.** } for which I enclose remittance value **£ s. d.**

*** Current subscribers, who send for the books only through their newsagent, must sign this declaration:
I am a yearly subscriber to the "AEROPLANE" through.....Newsagent.

Address.....

Subscriber's Name.....

that in future there would be that co-operation, and that the meteorologists would get a great many reports of upper air conditions from aerodromes.

SHIP OBSERVATORIES.

Mr. T. F. GAYNOR asked the Lecturer if it would not be an important acquisition to the international meteorological service, especially for trans-Atlantic aerial navigation in the immediate future, if a few suitably designed station-ships were permanently stationed at regularly-spaced distances apart along known parallels of latitude—say 40 degrees and 50 degrees North latitude—fully equipped with meteorological instruments and telegraph devices, to observe conditions at their respective localities and report frequently to flying aircraft and to the American and European land stations and be maintained by the British and American Governments?

FORECASTS FOR ATLANTIC FLIGHTS.

Mr. F. H. BRAMWELL asked how much the percentage of accuracy in the forecasts fell off after various periods. A man starting to fly the Atlantic would want to know what chance he had of reasonable Atlantic weather some 20 hours or so after the time he left the ground, or probably more like 30 hours after the forecast was prepared by the Meteorological Office.

LT.-COL. LYONS'S REPLY.

Lt.-Col. LYONS, replying to the discussion, said with reference to the remark that the war front in France was a small area, the area for which the forecast was supplied was small, but the area from which the material was obtained was not small. It ranged from Iceland to North Scandinavia and down to the Algerian coast.

In Egypt the conditions were simpler and more stable, and the area became more manageable and distinctly smaller. In Egypt, as a rule, dealing with the ordinary weather forecast, nothing farther off than Malta directly affected them, in less than a couple of days. For use with telephones or wireless messages a code was necessary at the Meteorological Office, specially worked out to simplify and shorten the transmission of returns and forecasts.

He had experienced the strong night winds over the desert. He had never satisfied himself as to the reason for them. The information given by aviators to the meteorological service in France and in this country had been of the greatest value

He had not the figures in his head as to the falling off in accuracy of forecasts. It was an important point and should be followed up. He would like to take a particular case and look that up, and send the inquirer the information.

The Meteorological Office would be pleased to have the fixed stations suggested by Mr. Gaynor, but the practical difficulties would probably postpone them for a long time.

The PRESIDENT, in proposing a vote of thanks to the Lecturer, remarked that we had progressed a good deal since the days of Col. Ogilvie's memorable expedition up the Nile by what Col. Ogilvie called two frail pilots, but whom other people would call two of the pluckiest pilots that ever stepped.

In the near future he thought we should have aircraft which would stand anything but the most violent gale. It was to the credit of the Meteorological Office that they had advanced so far in securing a perfect organisation. He hoped the International Congresses and discussions now taking place would result in securing the co-operation of all the services interested in meteorological information for aviators in this country and abroad.

SAMUEL PIERPONT LANGLEY.

From a somewhat unexpected source—the "Johannesburg Star"—one gleans some interesting biographical notes concerning Samuel Pierpont Langley, the American pioneer, who, at the end of the nineteenth century, succeeded in constructing an aeroplane capable of flying. That it was not the first machine to fly was due to a chain of accidents such as often robs pioneers of the fruits of their labour.

Of all those who in these early days investigated the possibilities of dynamic flight, Langley was, undoubtedly, the best equipped by training, experience, and natural aptitude. He was the scientist of world renown, an engineer of uncommon merit, and his ultimate non-success was due mainly to an unbelieving Press whose criticisms and ridicule caused the cutting off of the funds which would have made a continuation of his experiments possible.

Langley was the descendant of a substantial and intelligent family of New England, among whom were skilled mechanics, business men, clergymen, and teachers, including a President of Harvard University.

He was born in Roxburg, Mass., on Aug. 2nd, 1834, and was educated at Boston—he was trained in architecture and civil engineering, and followed his profession in St. Louis and Chicago for seven years. Thereafter a natural fondness for astronomy prompted him to give up his business and devote himself to the construction of telescopes, after which he journeyed to Europe and spent three years in Observatories, Institutes, and Art Galleries.

Upon his return he was made an Assistant in the Harvard Laboratory, and later Professor of Mathematics and a Director of the Observatory at Anapolis. At 32 he was made Professor of Astronomy and Physics of the Western University of Pennsylvania, and Director of the Allegheny Observatory. During a stay of 20 years in this position, he commenced his experiments in aero-dynamics, starting in 1887, and continuing for over three years. The results of his tests are counted even now among the most valuable contributions to the science.

Whilst at the Western University, he persuaded the railway corporation to adopt a standardised time system for the operation of the trains, the time being signalled along many thousands of miles of railway twice a day from a Solar clock operated by Langley, thus linking astronomy and railway operation. Another of his astronomical triumphs was the investigation of sun spots and the invention of the bolometer, an instrument of such delicacy and precision that it indicates accurately variations in temperature of less than one hundred thousandth of a degree centigrade, and by this means he was able to analyse in detail the heat of the moon in the lunar spectrum.

In 1886, following a long succession of astronomical investigations of an original and far-reaching character, he became an assistant secretary of the Smithsonian Institute, with the privilege of continuing his research work at Allegheny Observatory, and he held this position until his death on Feb. 27th, 1906.

Unlike most other investigators in the field of mechanical flight Langley did not follow rule-of-thumb methods. He engaged first in the most painstaking research to determine and classify the fundamental principles involved; his progress begun in the laboratory and ended in the workshop.

His aeronautical work was divided into the following stages:—(1) His experiments in aero-dynamics at Allegheny Observatory, where for three years he confined himself exclusively to the making of tests for determination of principles and the development of data to be used later in constructing models and man-carrying machines.

(2) His experiments with rubber and steam-driven models, the result of which was to enable him to construct a steam-propelled model which flew for more than three-quarters of a mile.

(3) He then experimented with a ¼ scale petrol engine-driven model, and, after successful demonstration, constructed a full size man-carrying machine, propelled by petrol engine. It was not, however, until some years after his death, in the autumn of 1914, that this machine was successfully flown by Mr. Glenn H. Curtiss at Hammondsport, New York, in an attempt to antedate the Wright patents.

The principal piece of apparatus which figured in Langley's experiments was a large whirling table with a radius of 30 ft. which consisted of two diametrical wooden arms revolving in a plane 8 ft. above the ground.

It was driven by a gas engine of 1½ h.p. during the early days of experiments, but as this was found to be inadequate, it was later driven by a 10 h.p. steam engine, and a set of step pulleys furnished a variable speed device and according to the gear employed 25-50-100 or 200 revolutions of the table could be obtained for a thousand revolutions of the engine. During the last of the experiments the gear ratio of the bevels was changed again, and a new system of pulleys installed, so that at 120 revolutions of the engine per minute, 48-24 and 12 revolutions of the whirling table per minute was secured, corresponding respectively with 100-50-25 miles per hour at the end of the arms. The full usefulness of this whirling table was reduced by its position in the open, and the consequent effects of air currents. Nevertheless, some of Langley's results obtained with this apparatus were wonderfully accurate.

THE PROPOSED INSTITUTE OF AERONAUTICAL ENGINEERS.

A meeting was held at 180, Sutherland Avenue, Maida Vale, on Thursday, Sept. 11th, to discuss the formation of an Institute of Aeronautical Engineers.

Some twenty members of the profession attended, and Mr. L. Howard Flanders took the chair.

A letter from Mr. A. E. Berriman, wherein he strongly protested against the use of the title "Institute of Aeronautical Engineers" on the ground that it implied competition with the functions of the Royal Aeronautical Society, and against the formation of such an association because the R.Ae.S. did in fact fulfil the legitimate functions of such an association, was discussed at some length, and it was the general decision of the meeting that the functions of the two associations were entirely different.

Mr. Howard Flanders' proposal that the new society should be also a Defence Association—which would perform for its members the legitimate functions of a trade union—was then discussed at some length. As might have been expected, the meeting generally disliked the idea of a trade union. It was generally conceded that technical workers of the educated class needed some protective organisation to look after their interests. It was decided that the provisional council should obtain a statement of the legal standing of a Defence Association, firstly when registered as a Trade Union, and secondly not so registered, in order that prospective members might weigh the relative advantages of the two positions.

Fine Grain Means Quality.

The best wood has the finest grain, and grain in steel is equally a test of quality. That is why

Edgar Allen's

Red Label Steel

can be trusted to do its work efficiently. Examination of a fractured piece reveals a silken surface. Owing to the presence of a small percentage of tungsten in its compo ition, this steel offers far greater torsional resistance than any ordinary carbon tool steel. This, together with its uniform ty, makes it ideal for Reamers, Threading and Screwing Dies, Broaches, etc., etc.

The "Bristol" Aeroplanes

Arrangements are being made by the St. Maurice Valley Forest Protective Association to provide centres throughout the forest areas controlled by them with constant patrols of aeroplanes so as to signal, immediately a forest fire is discovered, to wireless stations and secure prompt assistance. Active support is being given to this work by the Dominion Government, as it is believed that it will prove the best plan yet adopted for the prevention of forest fires.

The Aeroplane on Forest Patrol

Millions of pounds are lost annually through the vast destruction wrought by fire in the great timbered areas of the world. This loss can be enormously minimised by the speedy location of an outbreak. A patrolling aeroplane can not only cover long distances by reason of its speed, but its field of observation covers an enormous area.

The "BRISTOL" Aeroplanes, embodying the experience and regard for quality of BRITAIN'S PIONEER AIRCRAFT CONSTRUCTORS, are especially suitable for forest patrol because of their great stability and reliability.

Power and Productivity

To secure it in face of the reduction of working hours there is only one remedy—to use machinery as freely as possible and to see that the machinery is of the most efficient type.

That explains why electrical manufacturing firms such as ourselves can scarcely cope with the enquiries and orders we are receiving.

Electricity is coming to the rescue!

We have been Electrical Engineers and Cable Makers since '75. We gladly place at the disposal of every manufacturer and producer the knowledge we have accumulated during that period, hence—

If *your* problem is electrical, put it up to us, and we will send one of our specially trained Engineers to discuss it with you.

If you have a Cable to lay, an Overhead Line to erect, Transformers, Switchgear, or Motors to install—let us hear from you.

JOHNSON & PHILLIPS, LIMITED,

Electrical Engineers and Cable Makers since '75.

CHARLTON, LONDON, S.E.7. City Offices: **12, Union Ct., Old Broad St., E.C.2.**

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

AIRY NOTHINGS.

By "MEDWAY."

We live in the era of standardisation. We are even told that things are to be carried so far as to entail the standardisation of the engines to be used on the Imperial aerial routes before these routes themselves are in existence. Personally, I should prefer to start by tackling simpler branches of the subject.

For instance, there will no doubt be a considerable number of meetings at which Under-Secretaries of Government Departments and other shining lights of the political world will desire to apply dope to the Aircraft Industry and the general public. It would save a lot of time, which is otherwise bound to be wasted by manufacturers and representatives of the Press in attendance at such meetings, if the officially inspired utterances were standardised and printed in advance.

The standard speech would, of course, need to be replete with that loquacious reticence which enables nothing to be said in a large number of words. It would require to indicate the overpowering goodwill of the Government towards the Aircraft Industry and the pioneers of commercial aviation, and equally the determination of the same Government to do nothing whatever which could possibly involve any expenditure at all of public funds.

Diplomatic Verbiage.

The preparation of the speech is really a job for the same tactful people as are charged with the duty of giving expression to the whole-hearted adherence of the Government to a policy of Free Trade combined with a complete system of Import Duties and a substantial Imperial Preference. In the meanwhile, despite my lack of experience in the stringing together of diplomatic verbiage, I put forward the following merely as a rough first draft to serve as a basis upon which the elaborately finished article could be built up:—

Gentlemen,—I am giving you the pleasure and honour of my company to-day for the purpose of making it abundantly clear that the Government, which is so fortunate as to be represented by me, intends to treat Commercial Aviation in such a way as to ensure the speediest possible development of aerial services, the supremacy of the British Industry, and the total avoidance of any financial expenditure in aid of aerial enterprise.

One of our first duties is to dispose of the Government's own property in the shape of aeroplanes and airships. In this connection, it must be clear that any unfortunate risk of realising inadequate prices for this property can be eliminated by the total destruction of the property in question. Various alternative courses of action also suggest themselves. The property might be given away, or it might be sold at an exorbitant price.

To Relieve the Government of Responsibility.

We have to consider the immense potential value of aircraft services to the community. We have also to consider the pockets of those whose one and only idea is an immediate temporary reduction of taxation. It would be extremely nice to recover much of the cost of the war by opening up and increasing the value of territories in many of the comparatively undeveloped portions of the Empire. The process must involve some capital expenditure, and it would, therefore, be still nicer if you, gentlemen, consented to incur that expenditure and relieve the Government of all responsibility.

I need hardly say that even the most socialistic members of the community do not desire to nationalise properties or services so long as these cannot fail to show a loss. If, however, as I hope and expect, you are all willing to club together in a patriotic spirit and carry us through this difficult period, the nation will be only too pleased to take over the enterprises at a nominal figure directly they have reached that period where a regular and substantial profit is assured.

Just at the moment it is the duty of the Government to set you all an example in economy. The form of economy most easily practised and appreciated by the majority of voters—who, as you must recognise, are the people who matter—consists of spending no money at all. The truer economy, which consists of investing money in order to increase its value, is not nearly so obvious or easily explained. Fortunately, words cost nothing; I will therefore provide you freely with as many as you require, or even more. Explanations, however, postulate brains, and brains are an expensive commodity in which wise Governments must be strictly economical.

Benevolent Neutrality.

The Air Ministry possesses a certain number of machines, and the Admiralty has reported that when the political situation has cleared up—as it may do within the next ten years or so—it may be able to give an approximate estimate of the number of aircraft or aerodromes that it may or may not require. You will agree that nothing could be more explicit or satisfactory. These two departments are prepared to combine in making the great sacrifice which is entailed by offering to sell their property to the highest bidder. This, in itself, you will recognise as a great inducement. You will also be permitted to read the weather forecasts in the "Times," and the Post Office has undertaken to adopt an attitude of benevolent neutrality.

The Postmaster-General has even gone so far as to permit me to assure you, on his behalf, that in the preparation of your schemes you are fully at liberty to utilise the facilities of the mail, telegraph, and telephone services at the customary rates. It is even conceivable—and this you will agree is a most gratifying assurance—that at some remote period the proposition of carrying certain limited classes of matter by the aerial method may be given some slight consideration, provided, of course, that you are able to quote rates per ton conveyed which compare favourably with those prevalent on the nationalised railways of the country. This should be an easy matter.

A Donation of Regulations.

As for the other Government Departments, I understand that the War Office is willing to subsidise you by the free gift of its valued esteem and gratitude. Mean-

while, the Board of Trade and the new Ministry of Transport are waiting, with their tongues out, to present you gratuitously with thousands of regulations as to how machines may not be built and services may not be operated.

What we aim at is close collaboration between the Government and the Industry. In the first instance we provide the risk—inasmuch as you never know how your prospects may be affected by our legislation. You merely provide the money. From that point onwards you take the risk and, if things go well, we will ultimately take the money.

As the poet has so aptly put it, "By just exchange, one for the other given." It would be impossible to conceive a more promising form of collaboration—for that matter you could not conceive a more promising Government. We make promises, leaving you simply to make progress.

Then, again, both deeds and words are required to bring our great mutual scheme to full fruition. We will provide all the words, leaving you merely to supply the deeds. The future of such a scheme is boundless, and, if you go into it in a business-like manner, we, with some trifling assistance from you, will retain that supremacy in the air which you—I mean we—have gained during the war. (Applause.)

A CLUB FOR THE AIRCRAFT INDUSTRY

By BACCHUS (Retired).

More than one natural history book has told us that man is a gregarious animal, which fact is chiefly the *raison d'être* for mothers' meetings, night clubs, and thieves' kitchens, and is equally a *sine qua non* of war or peace.

But for this characteristic in the species life would be but an empty shell, and the amenities of the punch-bowl and of the tea-table would remain the subjects of one's dreams rather than of actual experience.

The man, therefore, who invented the club was a benefactor to mankind. He provided an opportunity whereby a natural instinct could find expression; and once the club came its success was assured.

Now, as is generally known, there exist clubs for all manner of purposes: for ensuring the arrival of the annual turkey with its attendant dainties, for evading sundry Acts of Parliament and bye-laws, and for co-ordination of feasting, sport, and study.

When aeronautics first became a reality it was natural that there should arise an Aero Club, and it was equally natural that such a club should be patronised chiefly by sportsmen of relatively independent means, for in those days the privilege of working for 18 hours a day at a badly constructed aeroplane in a poorly equipped shop was a luxury known only to the man of means.

When war broke out the enlargement of the Flying Services brought into the aeronautical world and into the Royal Aero Club a crowd of people who were strangers in a strange land: they were mostly men who had been concerned with affairs more profitable than the heroic pastime of throwing good money after bad at Brooklands, Shellbeach, or elsewhere.

Most of them were cognisant of the buying, selling, and hiring of motor-cars and motor-bicycles, and they thought in terms of so much per centum commission.

They took the King's Commission; some of them died for their country with gallant promptitude; others were content merely to assume the King's uniform and to pursue those paths of military probity which led them nowhere nearer than within 50 miles of the firing line.

Many of them entered, for the first time, the outer circle of that mysterious world where certain things are done, and where certain other things are not done, and they noticed that the inhabitants of this newly discovered sphere, whose principal duty in the scheme of things was to officer the British Navy and Army, did not chose to forgather in their social occasions with persons engaged upon the prosecution of commerce.

As a result, those new recruits to the Service hierarchy who possessed a lack of foresight and proportion and who forgot that with the return of peace they would themselves find necessary a return to the pursuit of the essential shilling, decided that it was not *comme il faut* for them to share their club with an unnecessarily large number of their class who did not enjoy the privilege of wearing the King's uniform.

Now, the net result of this craving for seclusion has been to bar civilians from election to the Royal Aero Club, except in the case of individuals who are a force in the land, and although no official declaration has been made on the subject, the shelving of a number of candidates concerned with commercial aeronautics seems a fairly plain hint that the existing membership of the Club, as represented by the committee, does not wish to associate itself at the cocktail bar and in the dining room with members of the Aircraft Industry.

If a definite statement to this effect were issued the ground would be cleared.

Every individual and every community of men is entitled to select congenial associates. None will quarrel with that principle, and if the officers and gentlemen, permanent and temporary, who at present permeate the R.Ae.C. want to congregate alone, they are welcome so to congregate.

What has been said in this article is uttered without animus; it is merely a statement of things as they exist, and is designed to point to the need for a Club for the use of those engaged in the civilian Aircraft Industry.

Such a club, if it is to be a useful institution, and not merely an establishment in which evasions of the drink regulations are facile, must be properly organised, and the proprietors must be of such standing as will ensure the club a definite status from its inception. If its foundation is laid with worthy objects in view there is no reason why it should not be governed by an authoritative body which has already established a reputation among those concerned with commercial aeronautics.

The institution which comes naturally to one's mind in this connection is the Society of British Aircraft Constructors, an association of the most firmly established and reputable aircraft manufacturers in the country.

A committee of its members might very well be appointed to consider the whole question and to decide on what lines a club should be formed which would be of most practical utility to the industry.

A well-equipped clubhouse situated in the West End would be necessary, with a first-class kitchen (and cellar). In addition to the apartments to be found in most clubs, such as dining room, smoking room, library, and billiard room, there might very usefully be an information bureau where all notices and documents of a general and not confidential nature, which circulate in the Aircraft Industry, might be inspected.

Also facilities might well be granted for the inspection of approved catalogues of goods handled by such members of the S.B.A.C. as chose to supply them, as well as up-to-date lists of the current prices of standard materials and fittings used in aircraft construction.

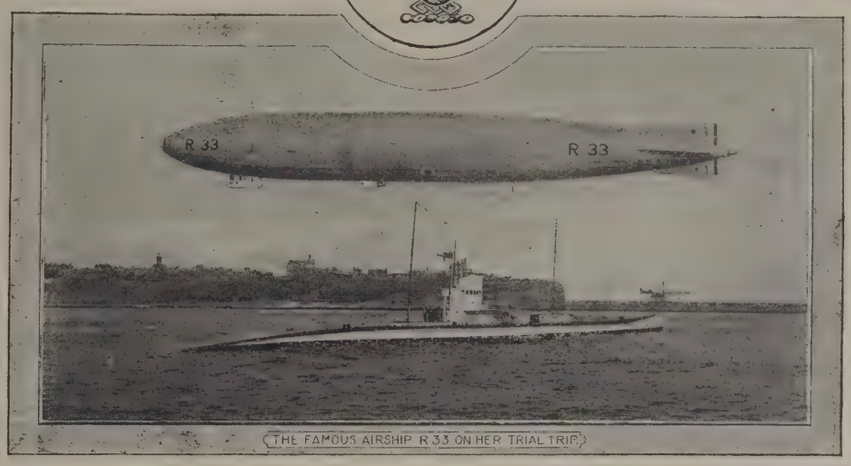
The conduct of private business is objectionable in any club, but a series of small private rooms might be provided in which members could meet and discuss business, an arrangement which would remove any excuse for the conduct of commercial affairs in any other part of the building, and thus would assure members that they would receive no molestation from others whose commercial enthusiasm might at times overmaster their good taste.

Now that most buildings in town with large rooms have been commandeered for war service it would be difficult to select a clubhouse with a lecture hall, but if this were possible a large room, which would seat up to 500 people, would be invaluable for lectures on all manner of subjects concerning aeronautics, when non-members could be received for the interchange of ideas.

The soul of any club is its secretary, and for a club of the character outlined a man is required who, for preference, is well acquainted with the different classes of people who are concerned with commercial aeronautics.

It must be remembered that no man can serve both God and Mammon. Equally a secretary who is also an officer cannot serve his King and his club at the same time, and a civilian who has no other interests is therefore essential for the post.

The committee should be men of the best class found in the Aircraft Industry, and in order that the new club should be organised on seemly lines it might be well to insist that the first members of the committee should be members of some other recognised club.



As regards membership, there is no reason why it should be limited to the administrative staffs of firms belonging to the S.B.A.C., but any person for whose respectability two members of the S.B.A.C. were willing to vouch should be eligible, subject to the approval of the committee.

A well-established club for the use of members of the Aircraft Industry would be of undoubted use for the interchange of information and ideas, and to encourage cordial relations between the different interests concerned.

It would certainly pay those firms who have been making riches out of aircraft to put up the necessary capital, not only as a direct financial investment, but for the good of the Industry as a whole.

Incidentally, it should be quite possible to admit to the membership of the club a limited number of approved members of His Majesty's Forces who are concerned with aircraft production.

TRADE MARK

THE FAMOUS AIRSHIP R 33 ON HER TRIAL TRIP.

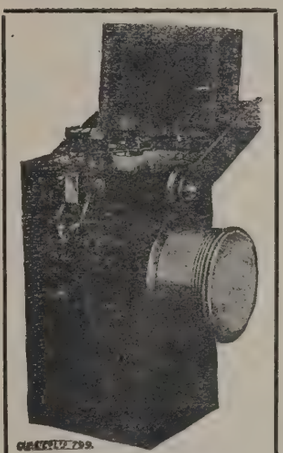
— RIGID AIRSHIPS FOR WAR, MAIL & PASSENGER SERVICE —

SIR W. G. ARMSTRONG, WHITWORTH & CO., Ltd.,

NEWCASTLE-UPON-TYNE. **Works: Barlow, near Selby, Yorks.**

LONDON OFFICE: 8, GREAT GEORGE ST., WESTMINSTER, S.W.1.

TELEGRAMS: "ZIGZAG PARL, LONDON." TELEPHONE: VICTORIA 4010.



Some reasons why this patent ELECTRIC HAND LAMP is the best article of its kind.

The accumulator is absolutely unspillable even if inverted.

There are no cable connectors to unfasten. The whole of the connections are contained in the case.

The cell can be taken out for charging or changing by simply opening the lid and lifting the cell from the case.

The switchgear is operated by a simple screw on the lid. A touch of the finger puts the light on or off.

H.D. Y 4 Hand Lamp.
And the price is only **32/6** each.

The cell gives 12 hours' light on one charge, and can be recharged in about 7 hours.

For garage, factory, workshop or the home the lamp is very suitable.

Always available, with a light of exceptional brilliance. Easily operated and of very light weight.

The bulbs are large and don't easily burn out.

CIVIL AERIAL TRANSPORT NOTES.

GREAT BRITAIN.

CIVIL AERODROMES.

The following lists of aerodromes are issued as an addition to the lists recently published. It may be seen that in the majority of cases the aerodromes referred to below can only be considered as possible emergency landing-grounds.

Attention is again drawn to the fact that these lists are purely provisional and subject to alteration or amendment from time to time.

LIST D. 4c.)

Aerodromes licensed as suitable for Avro (504K) and similar types of aircraft only. Except in very few instances accommodation does not exist. The licences have also been issued for limited periods only.

Aerodrome.	Nearest Railway Station.	Nearest Town.
Aylesbury (Race Meadow)	Aylesbury	Aylesbury
Conway (The Morfa)	Conway	Conway
Ashgate (Caushouse Farm)	Chesterfield	Chesterfield
Leicester (Aylestone Lane)	Leicester	Leicester
Derby (Race Course)	Derby	Derby
Marden	Cullercoats	Newcastle-on-Tyne
Stratford-on-Avon	Stratford-on-Avon	Stratford-on-Avon
Lochee Park	Dundee	Dundee
Perth (North Inch)	Perth	Perth
Warrington	Warrington	Warrington
Stoke-on-Trent (Sparrow Terrace)	Stoke-on-Trent	Stoke-on-Trent

LIST E. (A.)

STATIONS NO LONGER IN USE BY THE R.A.F.

These stations have been passed to the Government Surplus Property Disposal Board. They will be relinquished as soon as the Government property thereon has been disposed of. In many cases the aerodromes are now under cultivation, but it is probable that the sites still form the best emergency landing-grounds in the immediate neighbourhood.

Aerodrome.	Nearest Railway Station.	Nearest Town.
Hickling Broad (S)	Catfield	Yarmouth
Killingholme	Habrough	Grimsby
London Colney	Radlett	St. Albans
Shoreham	Shoreham	Shoreham-by-Sea
Seaton Carew	Seaton Carew	West Hartlepool

REFERENCES.—(S) seaplane station; (C) known to be under cultivation or otherwise unsuitable for landing.

Express parcels were carried on every flight except on one each of September 9th and September 12th, when the Under Secretary of State for Air and the Controller-General of Civil Aviation chartered, and were flown in, a D.H.16.

AVRO NORTHERN STATIONS.

The Avro Northern Stations, of which Blackpool is the parent, have now taken up 20,000 passengers. The stations in questions are Birkdale (Southport), Manchester, Fleetwood, Morecambe, Waterloo Sands (Liverpool), Rhyl, Douglas, and Windermere. Preston has been licensed and it is hoped that active operations will soon be undertaken there.

A "Travelling Circus" has now been established which will tour various towns in turn, spending a few days at each, to give demonstrations and take up passengers. The dates arranged so far are:—Barmouth, Sept. 15th to 20th; Nottingham, Sept. 22nd to 24th; and Derby, Oct. 6th to 11th.

A LONDON TO ROME FLIGHT.

In the last issue of THE AEROPLANE an Air Ministry announcement was given. It stated that Lt.-Col. W. D. Beatty and Lt.-Col. W. O. Raikes, of the Air Ministry, had left Hounslow for Italy in a Bristol "Fighter" on Sept. 6th at 11.5 a.m.

They arrived at Lyons at 5.50 p.m. The next morning they started out at 6.30 a.m. They were at Fréjus at 8.5 a.m., arrived at Pisa at 1.50 p.m., and left at 3.15 p.m. The "Times" correspondent states that at 4.38 p.m. in the middle of the Campagna, north of Civita Vecchia, within 50 miles of Rome, their propeller dropped off. In spite of this they made an excellent landing.

They spent the night with the machine. While awaiting the arrival of a car from Rome, a fire swept over the Campagna and destroyed the machine. These fires are common after the drought of summer.

The journey was made to arrange certain outstanding points with regard to civil aerial communication.

BRIGHTON.

During the week ending Sept. 13th, 90 flights were made by the Avros at the Ladies' Mile Aerodrome, Brighton, and 185 passengers were carried. Two cross-country flights were made to Chichester and return—one return journey was made in 15 minutes.

CARDIFF.

S. Instone and Co., steamship owners and general export and import merchants, of Cardiff, have purchased from the Air Ministry a large machine with Rolls-Royce engines. They have engaged as pilot Lieut. F. L. Barnard (late R.A.F.), who is said to have made the record number of cross-Channel flights.

Owing to the serious delays which have occurred during the last three months in the transport of papers, samples, and other light goods, the company decided to start their own service of express communication. If the experiment proves to be a success, the firm will acquire a fleet of aeroplanes. Airships might also be used for commercial purposes.

CHICHESTER.

Twenty passengers were taken up in an Avro machine, which flew over from Brighton on Sept. 11th. Weather permitting, Thursday flying will continue to take place at Chichester.

DUNDEE.

During the latter part of the week ending Sept. 13th Aerial Photos, Ltd., of Edinburgh, held a very successful meeting at Fochlee Park, Dundee. Numbers of prospective passengers waited their turn to be taken up in the Avro machines.

Sir Wm. Don and his daughter were the first passengers. At the conclusion of the meeting Captain Simpson (late R.A.F.) gave a display of stunt flying.

MARGATE.

Avro joy flights at Manston numbered 319 during the week ending Sept. 13th. Among the many passengers were Miss Currie, the Marquis de Ruvigny, the Comte de Ruvigny, and Dr. Saner. These passengers have been most enthusiastic, taking flights day after day. The Comte de Ruvigny is especially keen on stunting.

A blind man waited many hours one day for his flight, determined to loop and experience every flying sensation. The weather has been perfect, and everything is going with energy and success on the aerodrome.

NORWICH.

The "Daily Sketch," "Evening Standard" and "Illustrated Sunday Herald" free flights announced to be given next Sunday have been postponed.

PAIGNTON.

Three three-seater Avro seaplanes were in commission here during the week ending Sept. 13th. One machine arrived from Hamble. There were 174 flights made and 264 passengers were taken up.

PERTH.

Aerial Photos, Ltd., of Edinburgh, were very busy taking up passengers in their Avro machines at North Inch, Perth, during the first part of the week ending Sept. 13th. The damage caused to the machines by the gale at Dunoon has been repaired. The young Earl of Kinoull was one of the many passengers carried. The inhabitants of Perth are so enthusiastic over flying that they propose holding another meeting soon.

ACCLES & POLLOCK, LIMITED.

REPUTATION.

As manufacturers of weldless steel tubing, as tube manipulators, and as steel press-workers, we have a world-wide reputation for all-round excellence. Multitudinous are our products, and our reputation is behind every item.

We are right in the forefront with our "Apollo" tubular box spanners. They are becoming increasingly popular in progressive engineering work-shops. We make several patterns—including a special set for Ford Cars—all of which leave absolutely nothing to be desired in tubular spanner construction. Ask for our Spanner catalogue and price list. We can supply aircraft parts in big quantities, as in this connection we are specialists in tapering, bending, trapping, welding, and all other classes of tube manipulation and presswork.

To-day we recognise that aircraft builders have more time to manipulate their own components, but they need steel tubing, and we supply the very best. Further, let our war experience assist you in this matter of steel tubing and steel presswork. We may be able to save you money, because we have the tools for many components.

I.L.O. AERO OIL

THE Pilot is after all the man who matters—he can bear witness of a lubricant's efficiency when flying at an altitude of 20 or 30 thousand feet. That, too, is the time that matters. For this reason the makers of Dick's Aero Oil are grateful in acknowledging the many congratulatory letters that reach them from Pilots in regard to this Oil.

They take this opportunity of expressing their thanks and reiterating their assurance that the quality will remain unchanged until such time as it can be improved.

LONDON.

CRICKLEWOOD.—During week ending Sept. 12, Handley Page, Ltd., carried 40 passengers and 1,200 lb. of freight on their London Paris air service. The average time for the journey was 3 hours 29 min. Arrangements have now been completed for the passengers to be carried to and from the destination aerodromes in landaulette motor-cars.

HOUNSLOW.—During the week ending Sept. 13th 118 flights were made and 189 passengers were taken up. Over 6,400 passengers have been taken up by the Avros at Hounslow since May 1st. The following cross-country flights were made during the week:—One to Hythe and back, one to Margate, one to Weston-super-Mare. Two new machines were flown down from Manchester and arrived safely.

Mrs. Atkey, of Chelsea, is learning to fly on an Avro at Hounslow and made her first instructional flight a few days ago. It is believed that she is the first woman to undergo a course of training for a pilot's ticket since the war.

A three-seater Avro biplane flying from Hounslow to Southend, piloted by Lieut. E. A. Sullock (late R.A.F.) and carrying two passengers, crashed in Southwark Park on Sept. 9th. The pilot stated that a cylinder blew off at a height of 2,500 ft. over Bermondsey. The park or the river appeared to be the only landing-place. On landing, the back of the machine broke. All escaped practically uninjured.

A Vickers-Vimy commercial aeroplane left Amsterdam on Sept. 15th at 1.40 p.m., and arrived at Hounslow at 4.30 p.m., thus completing the 300-mile journey in 2 hrs. 50 mins.

Eight passengers were carried, including the Chief Technical Naval Officer of the Dutch Aviation Corps and his wife, and two Dutch engineers of the Royal Dutch Aero-Dynamic Laboratory. All the passengers were complete with luggage, and while the Channel was being crossed at 500 ft., owing to dense clouds, the party enjoyed a salmon mayonnaise lunch.

KINGSBURY.—The "Daily Sketch," "Evening Standard" and "Illustrated Sunday Herald" arranged to give free flights at the Kingsbury Aerodrome on Sept. 14th.

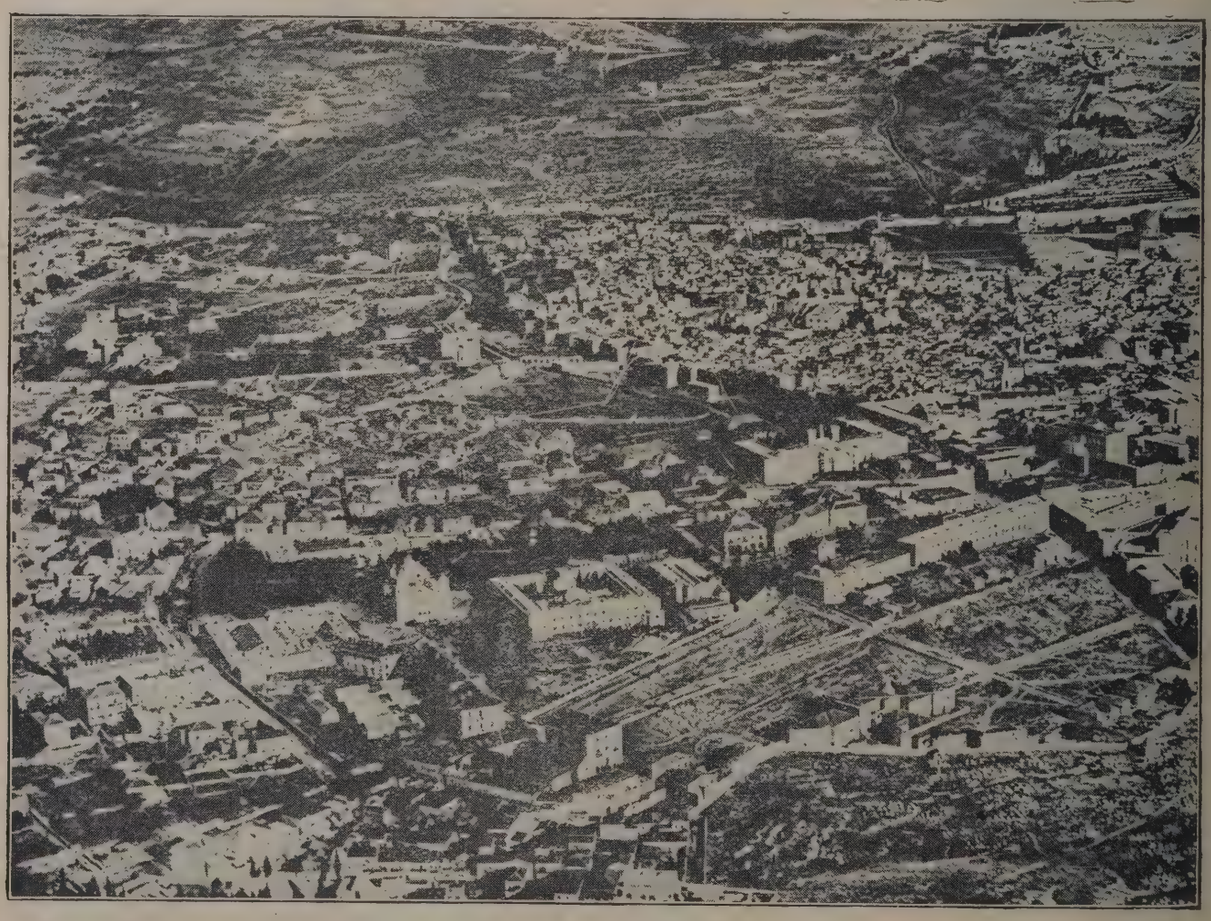
SOUTHAMPTON.

With the return of the fine weather during the past week, the Supermarine Flying Boat Service was resumed at Bournemouth, the Isle of Wight and Southsea. The rough and heavy weather during the preceding fortnight had been all against comfortable flying for passengers. With the calm sea and good weather, many of the visitors availed themselves of sea and coastal flights, also trips over and round H.M. warships lying in Bournemouth Bay.

The pilot of one machine flying from Southampton to Bournemouth on Sept. 12th, reported that about four miles off Hurst Castle he sighted a mine. Half a mile further on was one of the Government tugs from Yarmouth. The pilot circled his machine passed low down near the tug, and pointed out to the captain the position of the mine. It was then observed that the course of the tug was altered, and on reaching the mine a boat was put out. Nothing has since been heard of the subsequent proceedings so far as the mine is concerned, as the pilot then headed to continue his journey into Bournemouth.

WESTON-SUPER-MARE.

Capt. D. G. Westgarth Heslam is now in charge of the Avro Aerodrome at Weston, and has been flying with great energy and success since he took over. During the past week only one three-seater was at work. This made 81 flights and took up 161 passengers.



SWANSEA.

No flying was possible on the 7th, 8th, and 9th inst., owing to the weather, but nevertheless the Avros here—namely, three-seaters—made 204 flights and took up 244 passengers on the remaining days of the week.

CANADA.

An undated cutting from a local paper has been received from a correspondent in Victoria, British Columbia, which states that on a certain day seven visiting newspaper men made flights in the aeroplane "Pathfinder" in the afternoon, and a number of other visitors, including two ladies, were taken up on the next morning to see Victoria from the air. Among the brave journalists who took a trip on the first afternoon were Mr. W. J. S. Skidmore and Mr. J. H. PJalmer. [This is surely a new spelling for the universal night attire.—ED.]

The lifting power of the "Pathfinder" was well tested. Pilot Clemence, who did all the flying, had to coax the machine when taking off on one of the trips. In the front cock-pit was squeezed the hefty form of one of the editors, whose official weight was given at 225 lb. Another editor with 215 lb. to his credit was taken up for fifteen minutes.

An Oblique Photograph of Jerusalem taken from the air. The Mount of Olives can be seen in the background.

WHERE FLYING MEN ARE FITTED OUT.

The Dunhill "Plane" Coat.

The R.A.F. "Plane" Coat is made on the best form Trench Coat design, in heavily proofed Twill of the favourite Khaki Mixture, or in Blue-Grey Twill.

Unlined, for Summer wear, the price is ... 4 Gns.

Lined Check, with oil-cambric inter-lining 5½ Gns.

With superfine pure heavy fleece detachable lining ... ... 7 Gns.

Call in at our well-known "BASE" in CONDUIT STREET, or a post card will bring you patterns and self-measurement form.

Dunhills

LIMITED.

2, Conduit St., Régent St., London, W. 1.
Glasgow: 72, Vincent Street.

All the passengers were stunted, experiencing the sensations of the loop, spinning nose dive, falling leap, and half rolls. They enjoyed the trip immensely and wrote long articles on the flight to their daily papers. [The "falling leap" is a new stunt, apparently.—ED.]

The Aerial League in British Columbia is very busy carrying passengers at £4 for 15 minutes and taking them for urgent business trips.

BELGIUM.

It is intended that an aviation week shall be held at Ostend during next year open to aviators of all nations save those who were unfortunate enough to choose the wrong side in the late hostilities.

DENMARK.

The Danish correspondent of THE AEROPLANE writes:—

The arrival of Colonel Henderson, presumably on an Avro seaplane, is announced at Copenhagen, where the Naval air station at the Royal Dockyard had been prepared for his visit.

Other Allied aerial visits have been made by French Morane-Saulnier aircraft and by an Italian squadron, including Caproni. It was announced from London that Lieut. Brack-Papa, on the 700 h.p. Fiat biplane, would fly to Copenhagen before going to the Amsterdam Exhibition, but he has not arrived.

A spare Salmson engine having arrived by steamer, the Farman twin-engined Goliath now takes up passengers, piloted by Lieut. d'Ors. The visit of this French aeroplane has resulted in the formation of A/S Dansk Flyvekompagni (the Danish-French Flying Co., Ltd.) by Lieut. Krause-Jensen, which is to maintain a Paris-Copenhagen air service.

The discharged Flying Sub-Lieut. Pollner, lately an inspector of the Danish Sablatnig Co., is trying to form a new aerial company—Paul Pollner's Passenger and Post Packet. There are now five Danish air traffic ventures. Pollner has bought one of the four Rumpler biplanes which were flown up originally for the planned enterprise of Lieut. Foltmann. Two of these machines were abandoned by the German pilots. The farmer on whose ground one landed advertised for the owner to come and fetch it and to pay indemnity for harm to the corn, or he would sell it by auction. The second Rumpler biplane has been sold so many times over by auction at Roskile that the present owner cannot be found.

The Danish Air Shipping Co. indulges in provincial joy-ride business. The machines are flown by Army pilots on leave. The company will shortly start a flying school with a German chief pilot named Hubrecht. The moving power of the company is the sportsman Tholstrup, who has taken over a Fokker model VII scout and a Brandenburg seaplane beside a number of L.V.Gs. from a German business relation of his, who is the manager of the last-named works.

The Danish Air Express carries out at present only provincial joy-rides with one Sablatnig biplane, piloted by a German. As the German Sablatnig Company has acquired the late Naval air station in the city Aabenraa of the Sleswig part of Germany which is to be returned to Denmark, an air service to Copenhagen will likely be operated.

The Slesvig pilot Schmidt recently flew with a British Red Cross officer from Berlin to Copenhagen on a modern 230 h.p. Albatros and was out for a Danish circuit and altitude flight. On the return flight to Berlin, with an actor and his wife in the dark, he crashed as he had forgotten his map. He has returned to Slesvig for fresh efforts on a Sablatnig biplane.

The Danish Air Traffic Company is preparing for co-operation on the international air routes, but is not to get the Danish monopoly as was first planned. This is because the Air Bill before the Danish Parliament has been changed thus, that while a concession is still required for running a service, this concession does not give sole rights for that route.

The Naval experimental mail service has been stopped, and has left a good impression of reliability. It is to be resumed on an enlarged scale to Flensborg, when Sleswig returns to Denmark. On the 230 h.p. Benz-engined Friedrichshafen mail seaplanes, Flt. Lts. Thile, Lichtenberg, and Just-Rasmussen carried out a reliability flight last week with passengers. They flew from Copenhagen to the submarine base at the island Æro, via the air station Slipshavn, where petrol was replenished, and round Sealand back to the capital (520 kilometres).

At the request of the police the two first-named officers flew last Sunday with detectives in search of a jewel thief, who was believed to have stolen a yacht in efforts of crossing the Sound to Sweden.

Messrs. Nielsen and Winther have closed their aircraft department. They have lost a case brought against them by a Danish and a Finnish pupil for accidents while training at the firm's flying school. As the manager, the former Flt. Lt. Ussing, had not tested the machines, Blériot monoplanes, after changing the taxying planes for flying ones, the pupils both got their tuition fee and breakage deposit back, and one obtained indemnities for personal injuries.

FINLAND.

Hugo Ahlberg's Munition Works at Abo, in Finland, are being transformed for the manufacture of aeroplanes and automobiles, with a joint stock of five million marks that can be tripled.—HI.

FRANCE.

In addition to the military aerial services in the Near East described in the "Naval and Military Aeronautics" section of to-day's issue, the French military aviation service is running a civil aerial post between Constantinople and Bucharest. This route was opened on July 8th. The use of this line has brought Paris postally within six days of Constantinople. The following regulations are observed: (1) No letters are taken exceeding 50 grammes in weight; (2) Each letter is surtaxed one franc; (3) The total weight of correspondence carried by each postal aeroplane is 110 lb.; (4) Postal aeroplanes leave each Monday and Friday at 6 a.m. The service has so far been a complete success.

M. Chevillard, who left Toussus-le-Noble on Sept. 1st, flying a dual-control Farman biplane (F46 school type), reached Madrid on Sept. 9th.

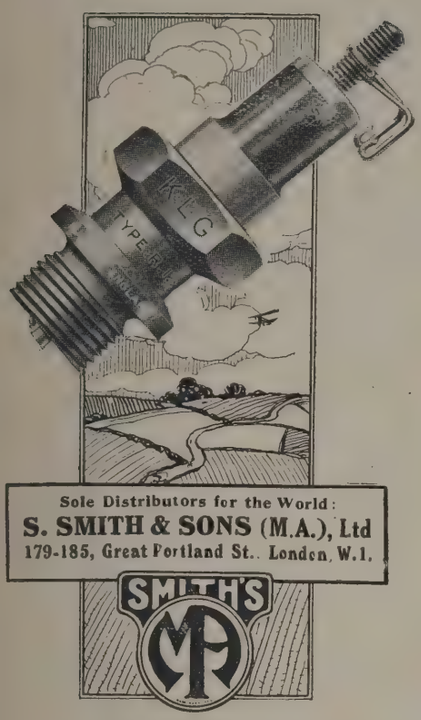
It is understood that M. Louis Bleriot is acquiring the assets of the S.P.A.D. company, which is now in liquidation.

The "Aviette" on which M. Poulain attempted recently to win the Prix Peugeot, offered for a flight of twenty metres on a man-driven aeroplane, is of the following dimensions: Upper plane, 6 m. 50 by 1 m. 2; lower plane, 4 m. by 1 m. 40; bearing surface, 14 m. 66; weight of bicycle, 11 kilos. Total weight, 21 kilos. 200.

Certain manufacturers have announced their intentions as to the machines to be exhibited in the Salon de l'Aeronautique. M. Maurice Farman says that his firm will exhibit a "Goliath" fitted and upholstered in the latest fashion of aerial luxury, an F.40 school biplane and a tiny biplane fitted with a 40 h.p. Le Rhone motor. The Voisin firm intend to show a large model of their four-engined biplane, as the real machine is too large to rest happily on the stand. If possible, the fuselage of the big machine will also be shown in order that people may see to what degree comfort in the air has increased since the war ended. The Nieuport firm will show a type 29 biplane, one or two flying boats, and a small racing biplane.

An Italian Caproni machine, carrying 24 passengers, landed at Lille on Sept. 14th. The next morning it started for the Amsterdam Exhibition.

M. Paul Poiret, a Parisian costumier, and two of his mannequins were due to arrive at Hounslow from Paris on Sept. 16th with the principal costumes to be used in the production of "Afgar" at the London Pavilion on the next day. They intended making the trip on Sept. 15th, but were prevented from leaving, as one of the mannequins had not complied with the necessary passport regulations.



On Sept. 11th, Maj.-General the Rt. Hon. J. E. B. Seely, C.B., C.M.G., D.S.O., M.P., and Maj.-General Sir F. H. Sykes, K.C.B., D.S.O., were flown by Lieut. Shaw (late R.A.F.), in an Airco machine from Le Bourget to Deauville, where they were interviewed by Mr. Lloyd George.

GERMANY.

Defeated in the war, the Germans are making every effort to achieve a victory in peace. While the politicians wearily debate the future of the world with particular reference to the advantage of their own countries, the German commercial bodies are working consistently and determinedly to restore their country's lost supremacy in trade. In the aeronautical industry this effort to become commercially pre-eminent is clearly indicated by the recent opening of many aerial passenger services throughout Germany.

The following services are at present in operation. They are organised by the Deutsche Luft Reiderei and controlled by the Hamburg-Amerika Line. The machines used are five-seated A.E.G. biplanes and two-seated D.F.W. biplanes.

(1) Berlin-Weimar. (Twice daily.) Fares, single, 450 marks; return, 700 marks. (2) Berlin-Frankfurt. Fares, single, 600 marks; return, 700 marks. (3) Weimar-Frankfurt. Fares, single, 450 marks; return 700 marks. (4) Berlin-Leipzig. Fares, single, 350 marks; return, 500 marks. A second service is run by the Rumpler Company with machines carrying 2 passengers and 440 lb. of goods. (5) Leipzig-Weimar. Fares, single, 200 marks; return, 300 marks. (6) Berlin-Hamburg. Fares, single, 450 marks; return, 700 marks. (7) Berlin-Warnemunde. Fares, single, 400 marks; return, 600 marks. The Sablatnig firm also runs a service on this route with a continuation to Copenhagen. (8) Hamburg-Warnemunde. Fares, single, 350 marks; return, 500 marks. (9) Berlin-Hannover. Fares, single, 450 marks; return, 700 marks. (10) Berlin-Westphalen. Fares, single, 500 marks; return, 700 marks. (11) Hannover-Westphalen. Fares, single, 500 marks; return, 700 marks. (12) Berlin-Breslau. Fares, single, 500 marks; return, 750 marks.

Manufactured by the
ROBINHOOD ENGINEERING WORKS,
Ltd., Putney Vale, London, W.

K.L.G

THE MOST DEPENDABLE PLUG IN THE WORLD.

For every Plug purpose the K.L.G. Standard Model R.1 has no equal. It is a one-piece Plug throughout and possesses all the advantages of detachable Plugs without any of their disadvantages. This model has been adopted as standard by many leading Motor Car Manufacturers.

Price 5/- each.

THE K.L.G. PLUG CLEANER.

This cleaner consists of a trip'e pronged scraper made in one piece from steel. By simply inserting this right into the Plug and giving it several turns backwards and forwards it removes the carbon fr m the whole surface of the mica insulation, and, of course, cleans it away from the end of the Plug as well. The use of this simple cleaning device maintains the "K.L.G." Plugs in good condition always. Price 6d. each.

Write for Price List of K.L.G Plugs to

THE

Grahame-White Rolls-Royce Aero-Limousine.

This machine, which can be seen in flight at Hendon, has been designed specially for pl asure and commerce. It is not an adapted war machine. Fitted with two 320 h.p. Rolls-Royce engines. It has a maximum speed of 115 m.p.h., and a flight radius of 4 hours. The limousine, luxuriously upholstered, and containing an electrically heated carpet, carries 4 to 6 passengers. The pilot, with whom communication is maintained by speaking tube, sits in a separate compartment above and at the rear of the passengers' quarters.

THE GRAHAME-WHITE COMPANY LTD.

Head Office and Works: **The London Aerodrome, Hendon, N.W.9.** *Phone: Kingsbury* 120 (8 *lines*).

London Office: **12, Regent Street, Pall Mall, S.W.** *'Phone: Regent* 2084.

Another service between Berlin and Munich will shortly be opened by the Rumpler Company. A new company is also in course of formation to open routes between Cologne, Hamburg, Bâle, Stuttgart, Frankfurt, Munich, and Breslau. This company will possess 200 aeroplanes.

The Danish Correspondent of THE AEROPLANE writes :—

It is now announced that the 230 h.p Benz-engined seaplane flown by Captain-Lieut. Christiansen, with Ship-Officer Wladika as observer, to Bergen and delivered there, was built by the Lübeck-Trawemünde Aircraft Works after the revolution.

Three L.F.G. seaplanes, fitted with 230 h.p. Benz engines and with cabins for three passengers, have been in service between Stralsund and the seaside resorts on the island Rügen. Flights to schedule time could not be carried out owing to lack of fuel. Two hundred and thirty-six flights, covering 7,061 kilometres, were made in one month from July 24th. The average speed made was 93 m.p.h. The flights made were chiefly passenger-carrying and going in search of thieves. A doctor was fetched in one for an operation which had to be performed quickly.

The nucleus of the coming German air police force has been formed by the Karlshorst Squadron under the command of Captain Kastner. They have two speedy scouts, supplied by the Home Office, and two giant aeroplanes for quantity transport of policemen. A landing ground is prepared by the Swiss frontier. More stations are to be built in Hamburg, Breslau, and Hanover.

The D.F.W. commercial biplane, with enclosed cabin for three passengers, the arrival of which near the E.L.T.A. was announced in large advertisements in the Dutch papers, was flown by Lieut. Diemer, carrying a lady and gentleman as passengers. "Flugsport" intimates that its presence was unpleasant to the Aero Exhibition authorities. It states that Mr. de Jonge, of the passage office (which it calls the spy office) offered immediately on its landing 3,000 fl. by a passenger who wished to fly to Copenhagen next morning, so that the machine might leave the exhibition. The arrival of more D.F.W. aeroplanes is announced, and the German journal lets its Dutch correspondent say that the German aeroplane trade has indisputably attained a pre-eminent success, which is justified, as the E.L.T.A. can show nothing even approaching the D.F.W. machine.

HOLLAND.

E.L.T.A. NEWS.

An Airco D.H.9R aeroplane, fitted with a 450 h.p. Napier engine and piloted by Capt. Gathergood, covered a closed circuit course of 137 miles at the Amsterdam Aircraft Exhibition at a speed of 145 miles per hour.

Thirty-five competitors finished the course in the closed circuit race. The D.H.9R. won over the next machine by 10 min. The speed of 145 m.p.h. beats the British record for a closed circuit, which was also held by a Napier-engined Airco machine, by approximately 15 m.p.h. The D.H.9R returned to England on Sept. 11th, and arrived at Hounslow in 2 hr. 8 min.

ITALY.

The carriage of "express" letters from the capital to Sardinia by aeroplane is announced as having begun from Aug. 6th last.—T. S. H.

According to the "Morning Post" of Sept. 11th, a gambling house at Capri, kept by Alfred Green, a British subject, has been raided by the police, who flew at night from Naples by aeroplane for the purpose.

The police realised that if they crossed to the island (which is 20 miles south of Naples) by the regular steamer their arrival would be known. They therefore travelled in a seaplane in the dark and thus made a successful raid on the place, in which baccarat was being played. Besides the proprietor, they captured a beautiful woman who acted as a decoy and a score of cosmopolitan frequenters of the place, who are well known in Naples. Money and gaming materials were also seized.

An aerial service between Milan and Rome began on Sept. 6th and is running regularly. The journey is made via Pisa, where a landing is made. The Milan morning papers are now delivered in Rome by noon on the same day.

The Seaplane Circuit of Sicily, to be flown on September 14th, was open to three categories of aeroplanes :—(1) F.B.A. seaplanes (160 h.p. Isotta Fraschini V.L.B. motors); (2) seaplanes of any type with two or more seats; (3) single-seated seaplanes. In the first category 19 entries were received, in the second 13, and in the third 4. The cash prizes, which range from £400 in the case of Palermo to £80 from the Société Vinicale Marsala Florio, amount in all to £3,120. A number of gold medals and silver cups were also given by various public bodies.

NORWAY.

The Handley Page biplane piloted by Major T. Gran which crashed on a roof near Christiania on Sept. 6th cannot be repaired easily owing to the extent of the damage. On Sept. 9th Capt. Stewart, one of the passengers, left for England, where it will be decided whether the machine will be repaired. The attempt to fly to Stockholm will not be abandoned, but it is not decided whether it will be done this autumn even if the machine is repaired, as it will be rather late in the year for flying.

The Danish correspondent of THE AEROPLANE writes :—

An incident showing how aeroplanes are coming to the fore as the means of transport in a case of emergency occurred the other day when the General Consul Akselsen from Flakstad received news that his children were on the point of death. He was staying at a Copenhagen hotel. As no steamers were due to leave and the railway journey to Northern Norway takes two and a half days, he availed himself of aeroplane transport. As there were no machines in Copenhagen, he ordered one by cable from the Thulin Aircraft Works in Landskrona, crossed the Sound in a speedy tug, and set off in an aeroplane immediately on crossing in spite of a strong head wind.

PERSIA.

One learns from a private source that Italy is starting a flying ground in Persia, an officer pilot from the neighbourhood of Menaggio having left for that destination.—T. S. H.

UNITED STATES OF AMERICA.

According to an official statement issued by the U.S.A. War Department News Bureau on August 20th, instructions are being issued to discontinue at once enlistments for the heavier-than-air and for the lighter-than-air branches of the air service.

The Rt. Hon. Winston Spencer Churchill, M.P., Secretary of State for Air, has sent a letter to Mr. John A. Jordan, the superintendent of the Cleveland-Chicago division U.S. air mail. The letter has been forwarded to Washington. It contains data on British air systems, enquires for data of the U.S. air mail and states that Great Britain is seeking every possible method to improve and develop aerial travel.

"The aerial mail service between New York and Washington and New York and Chicago has already saved the country $170,000 a year over the railway mail, and when the multi-motored aeroplanes are in operation there will be an annual saving of $1,500,000."

Assistant Postmaster General Otto Praeger made that statement before the Cleveland Chamber of Commerce, which held an aviation week in celebration of the one hundred days' perfect mail service between Cleveland and Chicago.

Alva Bradley, chairman of the aviation committee of the Cleveland Chamber of Commerce and vice-president of that body, read the following resolutions adopted by the directors of the Chamber :

"*Whereas,* For the past one hundred consecutive days the aerial mail service between Cleveland and Chicago has been operated successfully, thereby demonstrating the practicability of mail transportation by this means; and

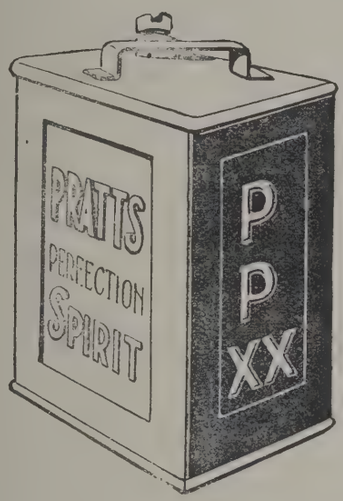
"*Whereas,* The aeroplane terminal facilities in both Cleveland and Chicago are inadequate to accommodate even the present limited traffic; and

"*Whereas,* Owing to the increase of aerial transportation, an urgent need for Federal regulation of aircraft traffic is apparent; now, therefore, be it

"RESOLVED, That the Cleveland Chamber of Commerce urges upon Congress the desirability of enacting suitable legislation regulating aircraft traffic, and that the Chamber of Commerce further petitions the Post Office Department, in co-operation wherever practicable with the military and naval aviation services, to extend the aerial mail service as rapidly as possible throughout the United States, and especially to provide suitable terminal facilities in those cities where such mail service is now in operation."

Mr. Praeger said he expected the aerial mail to be in operation to Minneapolis, Omaha and St. Louis by early spring, when multi-motored ships, carrying as much as 3,000 pounds of mail, would be available.

As a result of the joint activities of the Cleveland Aviation Club and the Cleveland Chamber of Commerce twenty-two Ohio cities, including Cincinnati, set about establishing landing fields in the week ending Aug. 30th.



The "Aerial Age" of America states in its issue of Sept. 1st that five hundred American aeroplanes have been sold and delivered to individual owners since March, 1919. Over that number could have been sold if the manufacturers could have produced them more quickly, but they have been completing their Government contracts.

The demand for pleasure aeroplanes at $7,500 is as great as that for training machines at $2,500, and many buyers have acquired training aeroplanes only because they could not get pleasure machines. Over a hundred people are awaiting delivery of Curtiss Orioles and flying-boats.

All the advantages of a perfect motor fuel are combined in

LODGE
AERO PLUGS
for maximum flying hours.

Here is the opinion of Captain E. D. C. Herne (late R.A.F.) of the Porthcawl Flying Services.

"In consequence of a great deal of trouble with another make of sparking plug, necessitating resetting of the gaps after every few hours' flying, I fitted sixteen of your sparking plugs to two 90 h.p., R.A.F. engines installed in Armstrong-Whitworth aeroplanes which I am using for taking up passengers

Up to the time of writing one engine has done 100 hours' flying and the other 75 hours, and in not a single instance has one of your plugs needed attention: I have not even had to clean one. I consider this to be little short of marvellous, because the plugs have been working under unfavourable conditions. The engines are air-cooled, and when "taking off" and landing a large number of times daily the average time of "all out" running of the engine is high, and puts far more strain on the plugs than long flights with the engine well throttled down

The fact that your plugs are fitted to my engine has saved my mechanic and myself a great deal of work, and I want to congratulate you upon turning out so perfect an article."

Exactly the same plug as used by Capt. Herne.

(Model K.R.3). Price 8/6 each.

If you want the same service you need the same plugs.

Write for particulars of aero plugs stating make and type of engine,

THE LODGE SPARKING PLUG CO., LTD., RUGBY.

Sweet Orr & Co., overall manufacturers, of New York, on August 20th sent out a salesman in an Aeromarine flying-boat. He flew from New York to Poughkeepsie and return, making numerous stops en route. Many orders for goods were given by clothing firms to the flying salesman. As a result of the success achieved the company announced that they would place orders for three similar type Aeromarine flying-boats.

Aeroplanes have recently been used in the Alabama mountains for locating illicit distilleries. Deputy-Marshal J. A. Wall made a trip over the territory and announced later that he expected that several arrests would be made.

The Central Committee of the Knights Templar Conclave which was held in Philadelphia in the week ending Sept. 13th arranged with the Philadelphia Aero-Service Corp. to provide hangars and flying accommodation for the Knights who came to the conclave by aeroplane. Provision was also made for a continuous free automobile service from the aerodrome to the centre of the city.

The Alaska Aircraft Transportation Company, of Seattle, Wash., incorporated under the laws of that State for the purpose of building and operating aeroplanes in Alaska for carrying freight and passengers, will make its first aerodrome at Valderz. They are planning to have, ultimately, landing grounds at all the important spots in Alaska to supplant the present difficult methods of transportation.

The president of the company, Mr. Tod M. Date, has had twelve years' experience with transportation problems in the north. He was formerly associated with the Standard Aircraft Corp., at Elizabeth, N.J., and the Naval Aircraft Factory at the League Island Navy Yard.

The aeroplane to be used is being designed to carry approximately six tons of freight. It will have a total supporting surface of 3,360 ft. and will be driven by four engines developing 400 h.p. each.

AERONAUTICS AT THE BRITISH ASSOCIATION CONGRESS.

The British Association Congress at Bournemouth held during the week ending Sept. 13th produced many papers dealing with the applications of science to the late war.

Aeronautices naturally figured to a considerable extent.

Before the Engineering Section, Dr. Leonard Bairstow, C.B.E., read a paper dealing with the progress of aviation during the period of hostilities; Wing Commander T. R. Cave-Browne-Cave, C.B.E., one on Airships; Capt. J. Robinson described the experimental work connected with the application of directional wireless to aircraft navigation, and Major T. Vincent Smith read a paper on Wireless in the R.F.C.

These technical papers will be dealt with in detail in future numbers of Aeronautical Engineering.

A paper read before the Economics Section by Sir Charles Bright on "Inter-Imperial Communication through Cable, Wireless, and Air" dealt generally with the utilitarian value of these three methods of communication.

Speaking of air mails and aerograms, Sir Charles said that while the mail to Australia took over five weeks, the aeroplane of to-day could cover the distance in 12 days. In those regions which were practically immune from fog or gale, air mails should have a considerable future, both as outstripping the mail ship over long journeys and as beating any telegraph system over comparatively short distances.

Lord Northcliffe said in a letter to Sir John Alcock:—"Just as in 1913, when I offered the prize, I felt that it would soon be won, so do I surely believe that your wonderful journey is a warning to cable monopolists and others to realise that within the next few years we shall be less dependent upon them unless they increase their wires and speed up." The letters and parcels that had been carried in the "Airco" aeroplanes between Folkestone and Cologne went to prove what could be done in this direction under properly organised conditions. The service was started on March 1st, and during that month 21 trips were made with 708 bags of mail outwards and 75 inwards. The letters could be sorted en route, sorting boxes being fitted to the aeroplane.

It seemed quite likely, too, that the aeroplane could be turned to account for the purposes of a highly efficient express letter service between different important centres throughout the United Kingdom. Mr. Holt Thomas, the controlling force of the Aircraft Manufacturing Company, had devised an ingenious plan of what he called aerograms for coming to the assistance of comparatively short distance telegrams or cablegrams by forming an "aerial connecting link," wherever congestion arose, between given telegraphic and telephonic systems. This promised to be of special use for the purposes of more rapid communication between, say, London and Paris, where telegraphic congestion occurred en route—in this case on the trans-Channel cables.

Great developments would now undoubtedly take place in the transport of correspondence by aeroplanes. The principal problem was really that of reducing the weight of the correspondence to such dimensions as were consistent with economy. Various expedients to this end had been suggested, but if systems of scientific language condensation were employed, a lengthy business communication could easily be transmitted on a sheet of paper the size of an ordinary postcard.

In a reference to the question of air communication Sir Charles said that the welfare of the Empire was likely to be considerably influenced by the position we eventually took up in these matters, whether we were first in the field, and the actual value of the air routes which we controlled. In days to come air stations would be at least as important as coaling stations were now. There could be little doubt that Egypt was admirably situated to become the Clapham Junction of the air.

The ultimate success of inter-Imperial commercial aviation really resolved itself into closely thought-out organisation backed up by no stinting—without actual waste—of the wherewithal to carry things out. It would remain for the Air Ministry, in concert with the Foreign Office, to work out the aerial navigation treaties with other countries, prepare the necessary aerodromes, meteorological and wireless stations, and make trial cruises with different types of machines in the various routes.

UNCONTROLLED CIVIL AVIATION.

The following letter has been received:—

Sir,—Apropos the incident of an aeroplane or some aeroplanes having caused trouble at Doncaster Racecourse this last week, and which caused Lord Lonsdale, as one of the stewards of the meeting, to at once telegraph the Air Ministry for assistance, you may have noticed that the A.M. replied by wire to Lord Lonsdale and asked for a report as to the full particulars of the case and the numbers of the machines.

To an ordinary observer of things in which one has no financial or any such interest, and therefore no necessity to acquire any knowledge of the regulations or working of the regulations of the "Air," it seems peculiar that the Air Ministry, after apparently admitting responsibility for the "incident" at Doncaster and the inconvenience to the Stewards, who no doubt had plenty to think about in controlling the meeting, which, by the way, was an instance of real organisation, should be bothered to send details of the matter to the A.M.

Why, I should like to know, could not the whole thing be dealt with by the police, who must have seen the machine and probably had every opportunity of "taking its number" and forwarding a report to the A.M.? Why not? I am quite sure Lord Lonsdale had no wish to act as "policeman" for the Controller of Civil Aviation.

We have been told on many occasions that the Civil Aviation people are, as it were, in "civvies"—we know that tailors in these days are very busy, and perhaps, therefore, one can excuse the uniforms still being worn, but procedure is presumably in "civvies"; anyway, the Controller told us so in more than one of his after-lunch or after-dinner speeches, and therefore I hope this incident will be dealt with in a "civil" manner and not necessarily on the lines of court-martial.

This matter at Doncaster is very serious and must not be repeated, because not only are lives endangered, but horses are also valuable, apart from which horse-racing is a real business and large sums are involved.

Passing to another "incident" this last week, you may have noticed at Bournemouth on Wednesday a land machine which flew over the sea, along the sands towards Boscombe, only about 50 ft. above the heads of the large crowds of people, and that on reaching Boscombe it appeared to crawl up the cliff, over the heads of the crowds there, and slowly disappear from view before turning round to do the "stunt" again. This machine had no number or mark on it at all. Now, I understand that all aircraft have to have numbers and be capable of being recognised when in flight.

Will the Air Ministry also inquire into this case, or, if we think of spending another day by the sea this year, are we to have momentary fears of this kind through Civil Aircraft un-Controlled?

I thought the exhibition of the old F.E. relic of the Air Board crawling along was bad enough, although there were cheers as it passed over the pier, but still it did have a number, even if a complicated one, but one would perhaps forgive that point, although I fail to see why aircraft should have these complicated numbers, such as P—ACK—1. Why not P 1225, which any policeman would recognise, and thus relieve people like Lord Lonsdale from furnishing reports "by request."

OBSERVER.

You couldn't see it from below

but it's nevertheless a fact—a fact which every flying man and aircraft manufacturer should note—that the majority of the machines competing in the Aerial Derby, including the three which were placed 1st, 2nd and 3rd, at the end of the race, were fitted with

AUSTER TRIPLEX AERO WIND SHIELDS

And that proves what the men who "know" think of them.

Let us have YOUR enquiries.

AIRCRAFT PROPELLORS

New AIRCRAFT PROPELLORS made of the finest Walnut & Mahogany.

FOUR BLADES at 30/-
TWO BLADES at 25/-

These Propellors cost originally from £15 to £25, and were made for engines which are now obsolete. They can be adapted for many purposes, such as HAT RACKS, and for appropriate HALL uses, to which they add a note of distinction, if fitted with a Clock or Barometer.

Sales can be made in a few minutes, and the goods taken away or arrangements made for delivery at the SHOW ROOMS of the AIRCRAFT DISPOSAL DEPARTMENT, YORK HOUSE.

Enemy Propellors.

Offers are invited for a limited number of Propellors taken from

CAPTURED ENEMY AEROPLANES.

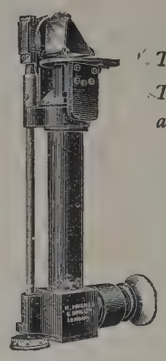
GRIPOLY
Solid Woven Belting

GRIPOLY Solid Woven Belting is made from Camel Hair Yarns, with a small percentage of cotton and woven by a patent process which ensures greatest possible strength and evenly consistent wear.

GRIPOLY has a triple twisted edge interwoven with the belting which effectively resists fraying caused by guide forks.

GRIPOLY Solid Woven Belting is flexible, non-slipping, stretchless, impervious to heat and moisture and variations of temperature. It is the best all-round belting.



Let us know your requirements and we will advise you as to the best type of "GRIPOLY" for your needs.

BRITISH COVENTRY

PISTON RINGS

Unlike many firms our Works were not turned outside-in to make something foreign to our ordinary business.

We made Piston Rings for Aircraft and Land and Water Transport all through the war period.

To-day we know more about Piston Rings than before; our staff is larger and more efficient; our facilities for manufacturing are six times larger than in 1914.

There is no "getting back" to pre-war trade with us. Your orders for Piston Rings, Shackle Bolts, Gudgeon Pins, and Greasers can be executed practically off the shelf and on the exact date you specify. Will that suit you?

AIRCRAFT FINANCE

CURRENT TOPICS

PETROL WILL NOT BECOME CHEAPER.

Petrol is not likely to become cheaper. This is the view held by those competent to judge the position. Happily, though the price of petrol has a direct bearing upon operating costs of aviation, it is not a supreme factor. In the course of time, however, when conditions of working have settled down on a more scientific basis, the price of petrol will become an item to be reckoned with.

THE OIL SHARE BOOM EXPLAINED.

This being so, the Aircraft Industry is particularly concerned with the sensational boom in oil shares now providing the outstanding feature in the Stock Exchange. This boom, of course, began over a year ago: it is now assuming a more remarkable phase which adds to the significance of the fact that it has already endured for more than twelve months. "After the boom, the slump," is nine cases out of ten a sound and logical inference, and no one need question the truth of the aphorism. But is it argued that the exception will be provided by oil shares, because the movement is not based upon the exaggeration of some extraordinary development of a temporary character, but upon a definite and permanent change in industrial organisation and method?

Thus the rise in coal as a fuel must eventually enforce the adoption of transportation facilities to the consumption of oil, which is economically cheaper in every way. It is already taking place, this change over to oil, and, with a constantly increasing demand for petrol for motor transport also, it is reasonably argued that petrol cannot become appreciably cheaper.

THE BASIS OF OPERATING COSTS.

Aviation in opening out commercially without the cheap, pre-war level of petrol is fortunate, inasmuch as a revision of the calculation is not necessary. This will be inevitable, however, if the price is established on a higher level. Incidentally, one ought to qualify the assertion that the boom in oil shares may prove the exception to the ordinary boom by pointing out that there are oil shares and oil shares. It is not solely the plausible financier who labels and embroiders his goods to mislead the gullible public.

WHITEHEAD SHARES BEING PEDDLED.

It appears that there are people who are attempting to sell Whitehead Aircraft Ordinary shares by backdoor methods. A case in point has just come to hand. Fifty shares have been offered to someone in the country who apparently has not followed the developments of the undertaking, for a lump sum of £20. This works out at 8s. per share. It is calculated that the shares are worth 1s. to 5s. to the prospective purchaser, and so it would be foolish, at all events highly speculative, to pay more than 4s. unless, of course, one is conversant with the inner movements of the business.

THE ACTIVITY OF ROLLS-ROYCE.

As regards Aircraft and kindred share values there is a considerable activity in Rolls-Royce, which are commanding up to 50s., it being said that the concern is now prospering exceedingly, and is booked up with orders for a long time ahead. There is also a constantly increasing demand for Darracq, but Sunbeams have been on offer at 38s. Armstrong-Whitworths announce an interim dividend at the usual rate of 1s. per share, free of income-tax, up to 5s. in the £. Assuming that the shares are maintained on a 12½ per cent. tax free dividend basis for the year, they would represent 6½ per cent., free of tax, to the purchaser at 38s., this would be equal to 9 per cent. on an investment subject to tax. Aircraft Manufacturing shares remain very much neglected, with both classes of preference standing about 14s.

INSURANCE MATTERS.

Underwriters are showing a keen interest in the regular air service inaugurated between London and Paris. They are fully alive to the possibilities of the situation; so far, there has not been any effect on the Insurance market. Business in aviation insurance generally is moderately brisk. Inquiries are numerous and come from all parts, including the United States, and there is said to be some activity in civil aviation in Italy.

JOHN SPENCER AND SONS' RESULTS.

John Spencer and Sons, of Newcastle, have been intimately concerned with Aircraft, but their chief business is steel making and engineering. The dividend for the past yea is to be only 6 per cent. instead of the 10 per cent. paid for the two preceding fiscal periods. Apparently, this is prompted by a policy of caution, for the figures available suggest that business was on a larger scale. Thus the gross profits at £99,400 is £25,300 higher. The net results do not compare so favourably. However, provision for the usual funds is on a larger scale, the allowance for renewals and improvements being £20,800, against £9,600; for depreciation £40,000, instead of £36,000. For the three years up to the outbreak of war the dividend was on a 6 per cent. basis.

AERONAUTICAL LIFE INSURANCE.

An insurance on the life of a passenger by the R.33, was effected for the cruise to the Continent and back on what appear to be very attractive terms to the insured. The amount at risk was £1,000, and the premium about £2, equal to 4s. per cent. Of course, the amount is really small. An American, who intends flying at home, has just covered himself for £100,000 here Clearly, he appreciates the merits of Aviation insurance.

BANKRUPTCY: A COMPOSITION.

W. J. STEVENSON.—The affairs of the debtor, who is the inventor of a chemical compound (acetate cellulose) have been before the Court upon the adjourned hearing to approve a composition of 10s. in the £ to unsecured creditors, which proposal has recently been entertained by the statutory majority of the creditors. The proofs of debt and proveable claims together amounted to £1,259, no realisable assets being disclosed by the debtor. Having regard to that fact and also to the fact that no patent had yet been granted in respect of the invention the Official Receiver had considered that the terms of the proposal were reasonable and calculatd to benefit the general body of the creditors. An order was made approving the proposal.

ENGINEERING PROPRIETARY, LTD.—DISCLOSURES.

Under a winding-up order made against this company, which was incorporated on July 17th of last year for the purpose of carrying on business as manufacturers of aircraft and component parts, the statutory meetings have been held. A statement of affairs submitted disclosed unsecured liabilities £4,347 and loans on debenture bonds £5,000, exclusive of debentures for £4,000 held as collateral security under contingent liabilities ranking pari pasu with those for £5,000. The assets, estimated to realise £7,387, leaving £2,387 to meet the claims of the unsecured creditors after payment of the loans on debenture bonds, comprised Robert Taylor's invention £5,000, good book debts £1,150 and a claim valued at £750. The company was incorporated with a nominal capital of £100 divided into shares of £1 each, and the Chairman reported that he did not propose to go into the facts which must be known to all those who were present. This was one of a "jumble of companies," and, although there was mention of a transaction involving £10,000 here, and another of £10,000 there, it was quite plain with its small capital, no such money had in fact passed, the items being merely cross entries in the books of the divers companies. There had, however, been some cash paid to this concern, and regarding a sum of £4,000 said to have been lent by a Mrs. Taylor that would have to be investigated. There were also other payments, and whether the money had gone into the directors' pockets or in some other direction would have to be ascertained. Lloyds Bank was a creditor for £3,000 odd, which money he supposed could be traced: but to his mind this was one of the several companies wasting its time with fictitious transactions with the result that there would have to be a great deal of investigation. There had been dealings with another company called Associated Aircraft, Ltd., by paying money to which Engineering Proprietary Ltd., had been wasting its own funds because it was now found that it had disappeared during the bankruptcy proceedings of one of the directors of that undertaking.

There was one matter to which he said he must especially allude, and that was this. Just when the winding-up proceedings were pending the directors put all the furniture, which was the only tangible asset, out of the reach of the company by leasing it to another company.

In any event the directors would have to bear the responsibility of their reprehensible conduct. Quarter day was coming and it was just possible that the company now holding the furniture might not pay their rent, when the landlord would distrain upon the furniture.

In reply to questions Mr. Nathan, a director, agreed that the directors of the company purchasing the furniture were the same as those of this company. But this concern was threatened with winding up and the other company wished to take its offices. The directors of Motor Maintenance and Associated Aircraft were also

the same: but he denied the suggestion that the furniture was transferred to put it out of the reach of the creditors of this company, which was never intended to be more than a holding company for shares. In the absence of a quorum, the meetings were formally adjourned for a week.

RUSHMORES, LTD.

Rushmores, Ltd., manufacturers of aeroplane spares, etc., Peterborough Road, Parsons Green, London, S.W.

A meeting of the creditors of the above was held on Aug. 26th, at the Cannon Street Hotel, London, E.C., when Mr. O. Sunderland, of the Automobile Trades Guardian Association, 15, Eastcheap, E.C., was elected to the chair. He submitted a statement of affairs which disclosed liabilities to unsecured creditors of £53,521 14s 1d., while the assets were estimated to realise £37,539 13s. 4d.

The principal creditors were the Ministry of Munitions, whose claim had been agreed at £40,000.

The company was originally known as Rushmore Lamps, Ltd., and it took over a business from a company which had a similar name. In 1917 the name was changed to Rushmores, Ltd.

The reason for the present position was the conditions which had arisen out of the war. While hostilities were in progress the company undertook war work and took up the manufacture of aeroplane parts, and production was becoming very satisfactory when the armistice occurred. Since then the company had attempted to return to peace work. A large contract was entered into with another company, which had since gone into liquidation. In connection with that contract there would be a claim against the Motor and Aircraft Supplies Co., Ltd., for any loss that was made, but a firm in Birmingham had entered into negotiations for the taking over of the contract. If those negotiations were successful and the contract was taken over, the claims against the company would be considerably reduced.

On the motion of Mr. E. H. Hawkins (Messrs. Poppleton, Appleby and Hawkins), seconded by Mr. A. Houstoun, a resolution was unanimously passed in favour of the voluntary liquidation of the company being continued, with Mr. Sunderland as the sole liquidator, and an informal committee of five of the principal creditors was also elected

A CHANGE OF TITLE.

From Aug. 5th, 1919, the style and title of the Air Navigation Company, Ltd., was changed to the Air Navigation and Engineering Co., Ltd. At their Blériot Spad works at Addlestone, Surrey, they are manufacturing a light car called the Blériot Whippet. It is a smart-looking little car and is fitted with an 8 h.p. engine. The provisional price is fixed at £175.

"ASCOL" SALE.

Consequent upon the liquidation of the Motor and Aircraft Supplies Co., Ltd., and the sale of all assets, the liquidators are now desirous of disposing of all the remaining stock both in Long Acre and at the works, and wish to do so quickly to enable them to vacate the premises by the 29th inst. There are many items which can be used for trades other than that of aircraft manufacture.

THE SUPER-SPECIAL TRAIN.

Aircraft Transport and Travel, Ltd., have issued a pleasing little book with a blue cover entitled "The Super-Special Train." It contains the story of one of the first civilian flights of great distance to be made in this country. The flight is that of Mr. Gordon Selfridge from Hendon to Dublin and back on June 25th. The story is entertaining, and the book is good to keep as a memento of that first long oversea flight. It is rather a pity that the book has been produced so long after the flight occurred.

On the last pages it is stated that the Private Hire Department of the Company is at the disposal of everyone who is prepared to pay the special fee required for one to be carried from point to point at 100 miles an hour. The fee varies from 5s. to 10s. per mile, according to the circumstances, and the charge for any particular flight may be ascertained by ringing up Victoria 7932.

The Company now has its own meteorological department which keeps the pilots informed of the weather which will be found ahead, at every stop on a flight.

GOOD LANDINGS.

To secure the co-operation of municipalities in the establishment of landing fields, the following article on "Good Landings," appearing in various magazines, is quoted in the official "News Letter" from Washington. The language is so quaint and so distinctly American that it deserves a wider circulation:—

For Aeroplanes and Seaplanes Wanted Everywhere and Soon. A new society has been founded which is intended to afford safe havens for our aviators. It is called the Good Landing Society. This new society, however, is new in name only. In reality it consists of the members and machinery of the Treasure and Trinket Society, one of our most useful war associations. With the ending of the war these worthy women, having quaffed deeply of the joys of work and the delights of service, have turned to other fields of usefulness, and picked the most important one of all—the one that has most pressing need of immediate attention. And there is suggestion, yes, inspiration—in their action. Why scrap useful war organisations simply because the war is over? Why not keep the organisation a going concern, but give a new work to do? Every city, town and village should have a landing station for aeroplanes and seaplanes. Those that are first with them will be first on the mail routes, first on the excursion routes, first on the package and parcel delivery routes, and first on the service routes.

These routes are being instituted NOW. The aeroplanes and seaplanes are here. They are not due to arrive next year, next month, or even next week. They are in operation and being extended as rapidly as landings are provided. In every city and town there is a war organisation of some kind. Don't scrap it. Give it a new job. Set it to work at providing a good landing for aircraft. Put your city or town on the aviation map and put it there before your rivals. Remember the early-bird cities will be the distributing centres, and slow-going neighbouring burgs will get their aerial mail, messages and parcels *via* your trolley lines and auto 'buses.

THE GLAD HAND.

The Germans are evidently intent on doing real business with this country, as the following extract from a letter shows:—

"We herewith take the liberty to approach you that in . . a . . . Luftreederei Akt. Ges. has been founded which shall serve to the private aerial traffic. Thinking that you have interest for such an undertaking in the German occupied territory, we inquire if you are disposed of partaking financial or material.

"Awaiting the favour of your reply."

Though the English grammar may be defective, the intention is evidently good, and the German shows his wisdom in believing that English design, together with German enterprise and organisation, would be able to capture the aerial transport work of the world. But will he receive the glad hand so easily in this country as he desires?

THE GOVERNMENT AND AIRSHIPS.

The following longer account of the Conference on Government policy in regard to airships held at Australia House on Sept. 8th is published in the lack of any complete official report. The Air Ministry state that they have no official report to issue, and that the Press Association account is available for use by all. The general and technical Press were not asked to send representatives to the Conference.

About 100 representatives of commercial organisations were present.

General Seely said they were gathered together in order to see what could be done to the best advantage for the State in disposing of such surplus aircraft of lighter-than-air type as the Government had in possession, and to assist generally the lighter-than-air industry. Any nation which depended only upon Service vessels would be greatly handicapped by comparison with other nations which had commercial airship services. The Government had decided that airships were to be handed over to the Air Ministry. At a conference with the Admiralty it was agreed that in future it would be the duty of the Air Ministry to tell the Admiralty what could be done in the air, for the Admiralty then to state their requirements, and for the Air Ministry then to carry out their wishes. General Seely read a letter from the Admiralty in which it was stated that the Admiralty had recently reviewed, in the light of the latest appreciation by His Majesty's Government of the general political situation, the size of the Fleet and its attendant craft. The development of rigid airships was not yet at a stage where any fixed proportion of the fleet could be laid down. The immediate object must be to cut down expenditure, and the Admiralty had come to the conclusion that for their purpose not more than two rigids would at present be required, one of them being of the latest type. This conclusion was reached on the assumption that the Air Ministry would encourage commercial enterprise in development and construction, and that they would in the future be responsible for development, and able to supply the Admiralty in reasonable time with airships should they be required for naval purposes.

They had a very large number of non-rigid airships, mostly designed to escort ships and overcome the submarine menace. He thought about 85 of these were now in existence, of which five were called the North Sea type, good, serviceable vessels, of considerable size. In regard to rigids, what would be available depended upon what was decided by those present, in consultation with General Sykes's department. Supposing it were decided to have all the airships now building of which there were plans, there would be a very considerable number. The R.33 and the R.34 were now in existence; the 36, 37, 38, and 39 were in various stages of completion, and the 40 was planned. That meant that if they found it worth while, with the assistance of the Government, to take up all the airships available, there would be four and possibly more to operate the service.

Government Conditions.

On behalf of all the Government Departments concerned, General Seely assured his hearers that they would give every assistance that could profitably be given to a well-organised concern which would take over those ships under the conditions which, of course, it would be necessary to impose. The conditions would be similar to those which applied to such ships as would be available in case of emergency to be handed over to the Government, under very generous terms in view of the fact that the airship business was exceedingly costly. Assistance with regard to wireless telegraphy and meteorological information would be put whole-heartedly at their disposal, and the Post Office were anxious to help in every way they could. Experimental work would be continued, and information so obtained would also be available, as well as other technical information. He could not commit the Government to any subsidy, but he pointed out the enormous advantage in having so large a quantity of material now offered to them at what would be a very low rate. As those ships were surplus to Government requirements, of course they would not attempt to charge anything like the full price for them.

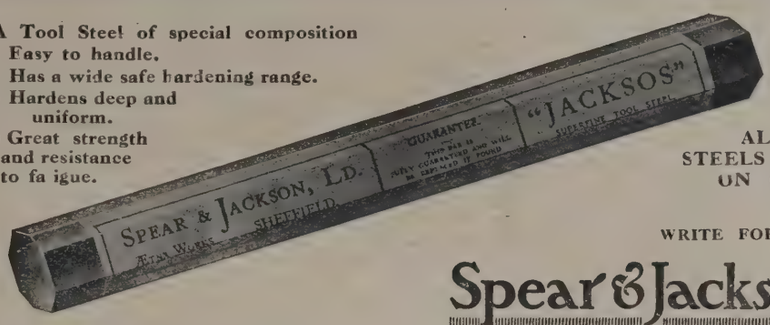
With regard to sheds and personnel, General Seely said that one huge shed was more than one-third completed. Probably anyone who wished to operate would wish to do so farther south—probably at Cairo—which would seem to be a central point. This shed would take the largest airship now built, and with a little additional length would take the largest airship they could at present contemplate, which would be of five million cubic feet capacity. The problem of the terminal points for airship services was most intricate and difficult. He thought he was right in saying that airships had travelled about two million miles with only one accident, through fire, involving destruction of the ship. That was a remarkable record, and showed what could be done. Recent efforts had shown that travel in the air was an accomplished fact, and that it had a very large percentage of efficiency. The promoters would have another great advantage in the very large number of demobilised personnel who would come back to a service such as they might start. Taking it all over, he thought the prospects for starting such a service were favourable, and he earnestly hoped that meeting would bear fruit. It would be most unfortunate if this country, which managed to secure air supremacy during the war, should lose it in the days of peace. He did not think there was much likelihood of that happening, but the lighter-than-air business was one in which they wanted the help of everybody. Germany got a long way ahead of us in it before the war, and we had nearly overhauled her now in our technical knowledge. If we were to confine ourselves only to service work there would be a great risk of falling behind in the race for supremacy in lighter-than-air. The future for it was boundless. It might be many years before it reached full fruition, but there was a vast future for airship travel.

Foreign Capital Question.

Sir Lionel Fletcher remarked that he thought that the attitude of the Government was going to be one of benevolent neutrality. A very important point, he thought, was whether the articles of association of the company should allow any foreign money, however clean, to be admitted. He thought they should get from the Post Office a pronouncement as to which route was to be developed first, and it would be an advantage if there was a priority list of routes to follow. He understood the Government would assist in any way with regard to designs, but he would like to know if they would take a strong line on that point. He would also like to know what stations were available for civil purposes, and whether they were to be sold or rented to the company. Could the company rely on the Government's support in every national way?

General Seely: Absolutely. He added that it would be an advantage if the capital were all British, especially in view of the fact that any scheme would have to provide for ships being taken over by the Government in time of war. On the other hand, it might well be that an airship company would be in a totally different position from any other, in that it constantly had to cross friendly States, to whom it might be desirable to give a share, so he would not like to lay down that all capital must be British. The scheme must be one which was approved, as regards its capital and directorate, by the British Government. With regard to design, he thought the divergence from our military type might become great, although it was likely to be less in the case of the airship than in the case of the aeroplane. He should think it would probably be wise for the Government to let the company design any kind of airship it wished, because, although it would not be as useful for service purposes, perhaps as a specially designed ship it would be more useful than no ship at all. With regard to the routes, it would be a convenience if they followed routes which would be best from an Imperial and strategical point of view, but he did not think they could impose any such conditions. Probably the Indian route was the one which promised the greatest chances of success. Most of the present stations would be at their disposal, but he did not think he could say definitely now whether they would be let or sold. It was a very urgent matter on the grounds of public economy that they should come to a decision at the earliest possible moment. He therefore begged them to put themselves in communication with each other and General Sykes with the least possible delay, and he hoped that within a month they would be in a position to come to the Government with a definite proposition.

Sir Trevor Dawson said he thought the scheme would be of great benefit to the Empire. He thought the only course to pursue was to get a few of the best financial people in the country and others interested in airship construction together, and try to form a large company to carry out the Government's wishes. Messrs. Vickers wished to assist the Government in every possible way.



General Seely said that both he and General Sykes considered it was essentially a case for one big concern rather than for competing concerns.

Sir Glynn West, on behalf of Armstrong, Whitworth, and Company; a representative of Sir William Beardmore and Son, and others present promised their support.

General Seely said he had received cordial letters from Lord Weir, who took a great interest in the scheme, Viscount Cowdray, Sir Owen Philipps, Lord Inchcape, Viscount Northcliffe, Viscount Furness, and Lord Montagu of Beaulieu, who were unable to be present.

A suggestion was made that Sir Trevor Dawson should call a meeting of everybody interested, and Sir Trevor said he would be glad to do so.

The WHEELER
Pocket Height and Weather Indicator

For Aerial Passengers.

THIS instrument is designed for use of aviators. It indicates the exact height at which the Aeroplane is flying and is of great **interest and value to all who fly.** Furthermore it has the additional advantage of indicating the weather for general use—it is, in fact, a pocket barometer. The instrument is made in watch form, gilt or oxydized case, and supplied in solid leather outer case in a secure and convenient form for the coat pocket.

Two sizes: Diameter 1¾" Diameter 2½"

Aircraft and motor accessory firms are invited to apply for terms.

Can be supplied with luminous dials if desired

OBSERVER OFFICERS.—H. Wisniewitz, M.C., W. L. Rutledge (with effect from Aug. 16th), R. A. C. Brie, J. C. Wallace, R. S. Langan, D.F.C., H. A. Bonilace.

It is intended that officers employed as Stores Officers or on "Q" duties shall belong to the new Stores Branch when formed. Officers appearing in this "Gazette" who are at present so employed will be transferred to this branch on its formation, and will accept these short service commissions on that condition. They will then come on to the rates of pay of that branch, but will meantime be permitted to draw the higher rates laid down in the new scheme for officers on the General List. Any officer posted to the Stores Branch on its formation will then have the option of declining his short service commission.

R.A.F.—FLYING BRANCH.—Maj. A. A. B. Thomson, O.B.E., A.F.C., is graded for purposes of pay and allowances as Lt.-Col. whilst empld. as Lt.-Col. (A.), from May 1st to June 30th.

Sec. Lts. to be Lts. :—I. M. Moffat, Nov. 27th, 1918 (substituted for the notification in the "Gazette" of April 11th); H. Booth, Nov. 30th, 1918; J. V. Scottorn, Dec. 26th, 1918; P. J. Baker, C. G. G. Fortune, March 1st; F. W. B. Anderson, July 24th.

Sec. Lt. R. A. Wade (late Gen. List, R.F.C., on prob.) is confirmed in rank as Sec. Lt. (A.), April 23rd.

The following relinquish their commns. on ceasing to be empld. :—Lt. (Hon. Capt.) (actg. Capt.) F. M. Hicks, Feb. 2nd; Sec. Lt. (Hon. Lt.) T. F. Blight (Lt., Manitoba R.), June 6th; Sec. Lt. P. S. M. Wilkinson (Lt., Wilts. R.), June 25th; Capt. A. Knight, M.B.E. (Lt., Loyal N. Lancs. R.), June 30th; Lt. G. Thompson (Lt. (temp. Capt.), Brit. Col. R.), July 8th; Lt. G. L. S. Rowell (Lt., R.A.), Aug. 5th; Lt. H. F. Attwater (Lt., North'd Fus.), Sept. 1st; Sec. Lt. C. H. Woolwin (Lt., Midd'x R.), Sept. 4th.

Transferred to the unempld. list :—Sec. Lt. S. W. Albertson, Sec. Lt. H. D. Anderson, Feb. 1st; Sec. Lt. W. Spriggs, D.F.C., Feb. 13th; Lt. J. S. Castle, Feb. 19th; Lt. A. Taylor, Feb. 26th; Lt. N. H. Auret, March 5th; Sec. Lt. C. F. Cawley, Sec. Lt. L. M. Thompson, March 15th; Sec. Lt. (Hon. Lt.) C. R. Cook, April 14th; Lt. J. C. Huggard, Sec. Lt. L. R. G. Langmead, April 15th; Sec. Lt. (actg. Capt.) J. S. Harvey (substituted for notification in "Gazette" of Aug. 26th); Lt. F. A. D. Vaughan (substituted for notification in "Gazette" of June 6th), April 16th; Lt. J. D. Clemence, April 19th; Sec. Lt. S. W. Cobb, Capt. D. P. Collis, April 29th; Lt. H. A. White, May 11th; Sec Lt. F. C. Wareham, May 15th; Sec. Lt. F. C. Ward, May 18th; Sec. Lt. W. A. Middleton, May 20th; Lt. T. Louw, May 29th; Sec. Lt. A. B. Anderson, June 12th (substituted for notification in "Gazette" of Aug. 19th); Sec. Lt. R. A. Lund, Lt. A. W. Scott, June 13th; Sec. Lt. (Hon. Lt.) W. W. E. Clarke, June 14th; Lt. F. W. Lowen, June 17th; Sec. Lt. (Hon. Lt.) C. H. Brown, July 7th; Sec. Lt. F. Nottingham, July 10th; Sec. Lt. G. Hanson, Sec Lt. R. Harper, July 11th; Sec. Flight Lt. E. D. Cole is transferred to the unempld. list, from (S.O.), Aug. 20th.

The notification in "Gazette," July 25th, concerning 5647 Cadet J. N. Cartier is cancelled.

PERSONAL NOTICES.

MILITARY.

ENGAGEMENT.

MALTBY—PATERSON.—An engagement is announced between Major Paul Copeland Maltby, D.S.O., A.F.C., Royal Welch Fusiliers, attached Royal Air Force, younger son of Mr. and Mrs. C. J. Maltby, Walgrove, Harpenden, Herts, and Winifred Russell, eldest daughter of Mr. and Mrs. J. H. Paterson, 6, Moray Place, Edinburgh.

MARRIAGE.

KINGSCOTE—PAUL.—On Sept. 9th, at St. Margaret's, Westminster, at 2.15 p.m., by the Rev. S. J. Marriott, Vicar of South Queens Ferry, assisted by the Rev. R. French, Lt.-Col. A. R. F. Kingscote, M.C., R.A., younger son of the late Col. Howard Kingscote, and Marjorie Paul, widow of Percival Paul, and younger daughter of Mr. and Mrs. Douglas Hindley, of Folkestone.

PRESTON—DONALDSON.—On Sept. 8th, Capt. Overton Preston, M.C., R.A.F., second son of the late Martin Inett Preston and Mrs. Preston, The Park, Nottingham, was married at the Registrar's Office, Henrietta Street, Covent Garden, W.C., to Victoria Mary, third daughter of the Rev. Peter Donaldson, M.A., B.D., late Pro-Consul at Salonika.

BIRTH.

LEARMOUNT.—On Sept. 11th, at "Bienvenu," 86, Rosebery Road, Muswell Hill, N.10, the wife of Major L. W. Learmount, D.S.O., M.C., R.A.F., of a son.

AIR FORCE.

DEATH.

COULSON.—Lieut. W. E. Coulson, R.A.F., aged twenty, who was killed in Lincolnshire whilst flying from Cologne on the 5th instant, was buried with military honours at Epsom on Sept. 11th. During the war he had been shot down and made a prisoner in Germany.

ENGAGEMENTS.

CROSBIE—MATTINGLY.—The marriage arranged between Flt. Lt. D. S. Crosbie, R.A.F., and Dorothy Grace Mattingly will take place very quietly at the church of St. Mary-le-Strand on Wednesday, Oct. 8th, at 12.30 p.m.

MACKEY—BRIGGS.—The engagement is announced between Capt. C. W. Mackey, R.A.F., younger son of Mr. and Mrs. W. J. Mackey, Highlands, Maidstone, and Kathleen, younger daughter of Professor and Mrs. H. Briggs, 3, Rodney Street, Liverpool, and Hoylake, Cheshire.

TURNER—BANKART.—The engagement is announced, and the marriage will shortly take place, of (Temp.) Major George Bankart Turner, M.B.E., R.A.F., son of Colonel F. Mansel Turner (late R.A.), of Norton, Guildford, and Kathleen May Graham, youngest daughter of Mr. and Mrs. Bankart, of Manton Grange, Oakham.

TURNER—HOPKINS.—A marriage has been arranged, and will take place on October 2nd, between Capt. Charles F. Turner, R.A.F., and Miss Elsie Hopkins, only daughter of Mr. and Mrs. T. E. Hopkins, of Perrysfield, Oxted, Surrey.

MARRIAGES.

BREBNER—WALKER.—On Sept. 10th, at Christ Church, East Sheen, by the Rev. J. R. Macvicar, M.A., Noël James Brebner (late Lieut., R.A.F.), only son of Mr. and Mrs. Percy J. Brebner, of East Sheen, to Ethel Maud, younger daughter of Mr. and Mrs. John Walker, of East Sheen

ELLERTON—HUSBAND.—On Sept. 13th, at the Chapel Royal, Savoy, Flt. Lt. A. S. Ellerton, O.B.E., R.A.F., was married to Maureen Gilliland, daughter of Mr. T. F. Husband, I.S.O., M.A., and Mrs. Husband, of 69, Belsize Park Gardens, Hampstead, by Sqdn. Leader the Rev. B. W. Keymer, O.B.E., C.F., R.A.F.

JUDGE—EADIE.—On Sept. 10th, at Bromsgrove Parish Church, by the Rev. A. D. Ager (Vicar of Catshill), Capt. Herbert E. Judge, late R.A.F., son of Mr. and Mrs. James Judge, of Cambridge, to Olivette, elder daughter of Mr. and Mrs. Albert Eadie, of Rigby Hall, Bromsgrove.

BIRTHS.

HARBER.—On Sept. 3rd, at Glenmore, Sutton Courtney, Berks, Nellie (née Halford), the wife of Capt. L. Geo. Harber, R.A.F., of a daughter.

EDWARDS.—On Sept. 6th, at the Vicarage, Cottage, Wressle, Yorks., the wife of the Rev. M. H. Edwards, Chaplain, R.A.F.—a daughter.

ORDISH.—On Sept. 10th, at 42, Northcote Avenue, Ealing, to Phyllis (née Megginson), the wife of Sec. Lt. R. W. A. Ordish, R.A.F.—a son.

WYNNE WILLSON.—On Sept. 13th, at 21, Endsleigh Street, to Elsie and Linton Wynne Willson, Major, R.A.F., Donibristle—a son.

KENLEY COMMON.

The inhabitants of Kenley are somewhat distressed over the prospect of Kenley Common being permanently occupied by the Royal Air Force (according to the "Times"). It was an open space, but part of the ground has been fenced off, and hangars of the latest type have been put up.

AEROPLANE BONFIRES.

It is reported that many thousands of aeroplanes have been broken up in France recently, and great bonfires have been made of them which have been visible for many miles around.

SEPT. 24, 1919.

ON CUTTING CONTRACTS.

There is a tale of an Irishman who, having sold a pig, was asked what sort of price he had got for it. His reply was simply:—"Well! I didn't get what I expected: but then I didn't think I would!"

That is pretty well the mental attitude of the Aircraft Industry over the contracts which have recently been cut off, as related with much apparent relish in the daily news-sheets of September 18th.

As a matter of fact, there was no sudden all-round cancellation of contracts, as one might have been led to believe by the aforesaid reports. Two or three firms had some rather recent "post-war" contracts cancelled during the week preceding September 18th, in accordance with a policy which was initiated some time ago, but the majority of the firms in the Aircraft Industry are to-day precisely where they were a month or three months ago, so far as Air Ministry contracts are concerned.

Even those who have inquired directly, indirectly, or obliquely, from various Departments of the Air Ministry cannot discover any fresh policy of cancellation. If a further raid on aircraft contracts is being contemplated by the False Economy Department of the Government's Propaganda Agency, it is being very skilfully hidden, for apparently nobody at the Air Ministry knows anything about it.

Therefore one is inclined to think that the daily Press has discovered another mare's nest, or at best a sea-serpent which is in reality a very small worm. But, to tell the truth, the Aircraft Industry as a whole is not vastly perturbed over the affair, for it gave up long ago any hope of being able to exist on Government orders or on the promises of the Under-Secretary of State for Air.

As soon as the Armistice broke out, everybody in the Aircraft Industry expected that their contracts would be cancelled forthwith. Some wise firms anticipated the cancellation of their contracts by starting at once to look for other business. Some fortunate firms thanked their Maker that they could now snap their fingers at the Air Ministry and all its works, and could return to their profitable pre-war business from which they had been dragged by D.O.R.A. Some firms, less wise and less fortunate, decided to run on with their aeroplane contracts as long as possible, and then either retire on their profits or wait for something else to turn up.

Everybody was more or less surprised that contracts were allowed to run so long after the Armistice as they were, for the Aircraft Industry, being composed almost entirely of civilians, hardly realised the difference between an Armistice and a Peace. Even those who did so were more or less under the impression that the German Army was broken as well as beaten.

A State of War.

Only a few saw that we were still in a state of war and that Germany still possessed a powerful Army, consolidated by the common sorrow of defeat, whereas the Armies of the Allies were enervated by relaxation after victory, and so would be less willing to start fighting again than the German troops would be. That being so, it was necessary to maintain all our establishments for the conduct of war until it was plain that fighting would not be renewed. And so the Aircraft Industry was allowed to continue to make aircraft matériel.

The fact that no further fighting took place on the West front after the Armistice seems to speak well for the good sense of those who took control of the Deutsches Reich in the absence of the Emperor, and also for the mutual respect in which the Western belligerents hold one another. The continuance of fighting on the East German front seems equally to show that the Slav cannot be trusted either to stick to agreements which he has made or to show ordinary common sense, and it would not be at all surprising if the war with the Slavs, which one ventured to prophesy some few months ago, were to develop straight out of these fights along the old East-European front, without any intervening period of peace. Perhaps such a prospect may brighten the outlook for those in the Aircraft Industry who cannot see any future for their business except in the supply of war material.

The Duty of a Leader.

Be that as it may, the continuance of war contracts for so long after the signing of the Armistice led a good many people to hope against hope that the Government was quietly using this peace-in-war period for the purpose of building up such a huge Air Force that when Peace actually arrived it would be impossible to scrap the personnel and matériel of the Force and its attendant Industry because of the waste involved in doing so. Such a hope was obviously giving the Government credit for more patriotism and courage than any agglomeration of politicians could possibly possess. And those who nursed such a hope were reckoning without their Mr. Lloyd George.

Of him one may say, as the "Morning Post" said of the late John Redmond many years ago, that he is one who believes that the duty of a leader is to lead—even in retreat. When the great god Demos began crying out for economy what could be more natural than that Mr. Lloyd George, the great leader of national extravagance as founder of the Ministry of Munitions, should head the mad stampede in the direction of false economy?

A French humorist, M. Arthur Rozier, writing in "La France Libre," has called Mr. George a man of rapid evolutions. M. Rozier describes him as an agile fellow always ready without scruple to rid himself of old friends for whom he has no further use and to take up others more popular with the electorate. Mr. George's cleverness in looping the loop in relation to his political views leads M. Rozier to label him "the ace of aces" among politicians.

The appositeness of M. Rozier's description applies neatly to Mr. George's actions in relation to aircraft.

When German air raids impressed the electorate with the importance of Air Power, Mr. George, at the earnest solicitation of Lord Weir, gave aircraft priority over all other war material. To-day, when aircraft cannot affect votes, aircraft may be scrapped with impunity—so far as the popularity of the Premier is concerned, if not with regard to the vital necessity of Air Power to the British Empire.

The Crimes of History.

It is the price we must pay for Democratic Government, in which those in power are elected by a scarcely educated proletariat—of which it is doubtful whether more than a small percentage are capable of being educated. A very able engineer, who during the war has become a distinguished officer of the General Staff, remarked recently that the two greatest crimes in history were the writing of "Uncle Tom's Cabin" and the passing of the Education Act of 1870. Though our generation is not likely to see the full fruition of the former crime, we are feeling the effect of the latter when the welfare of the Empire is in the hands of a man like Mr. George—the Mr. Smillie, or worse, of ten years ago—who depends for his existence on his ability to lead a fractionally intelligent public in the direction in which that public is most inclined to stampede.

It is not surprising that some of the most hardened Tories among us are praying for the advent of a Labour Government composed of honest men of the type of Mr. Roberts, Mr. Brace, and Mr. Clynes, who have at least a clear altruistic policy and are not mere political weathercocks.

It was because nobody really believed in the hope of a big Air Force after the war that nobody thought that they would get what they expected. Consequently nobody is surprised at the cancellation of their contracts, however much they may be annoyed.

"All Things Work Together for Good."

According to the Buddhist belief, best known probably to most of one's readers by way of the Lama who was the friend of the immortal Kim, "All things work together for good." So one is prepared to believe that just as the politician and the *pulex irritans* has each his place in the scheme of things so the cancellation of contracts may be all part of the scheme of an All-seeing Providence to give to the British People the Command of the Air. Just as our vile climate and small fields have constrained us to produce the finest aviators and the finest aeroplanes in the world, so the complete cutting off of Government support in the form of orders, and constant hindrance by Government departments in the form of restrictions and regulations, ought ultimately to produce a flourishing Aircraft Industry which has succeeded on its merits.

There are those who cry out for subsidies for air lines, for orders which will save the Trade alive, and for other forms of official aid. Personally one inclines to the belief that the cancellation of orders is the best thing that could possibly have happened to the Aircraft Industry, even though it may be the worst possible policy as concerns the Air Power of the Empire and the proper equipment of the King's Armed Forces.

The cancellation lands the Industry flat on its own bottom, and the future of the various firms composing that Industry depends entirely on the energy and initiative of each individual firm. A spoon-fed industry is no good to anybody, least of all to the members of that industry. Spoon-feeding in extreme youth is necessary. The Aircraft Industry has had all the spoon-feeding it ought to have had—thanks to the war, though before the war the Government's attempts at spoon-feeding were lamentably sloppy.

Subsidies are economically unsound, as is perfectly well known to every serious student of political economy. The only way in which a man or a business or an industry can be established on a sound financial footing is by payment for work done. In spite of the doctrines of certain Trade Unions, payment by results is the first law of nature. "By the sweat of thy brow shalt thou earn thy bread" is the simplest statement of that law.

The Aircraft Industry has now to make good on its merits. Possibly the particular kind of mental ability—some people might call it obliquity—which was successful in securing Government orders during the war may not be so successful in building up a sound business in civil aviation. But the business is there to be had if it is sought in the right way, and the absence of Government orders clears that way for commercial enterprise.

A Free Industry.

Already certain firms are laying the foundations for big aerial transport undertakings abroad. They will find their work simplified by the fact that they can build their machines for those services without interference by Government officials in this country.

When disputes arise as to the suitability or otherwise of certain machines or engines or other material for civil aviation in this country the makers can now put up a straight fight against the officials concerned, because henceforth they will be free from that ever-impending threat which, put into bald language, amounted to the statement that if the firm annoyed the officials concerned the said officials would take precious good care that the firm had trouble over its orders for the Government.

Even where firms and officials worked amicably together, as happened in some cases, the fact that Government and commercial machines were being built at the same time caused trouble and hindrance, merely because Government work had priority over everything else. The Government machines might be only produced in order to be smashed up by the Disposal Board, or to be stored indefinitely in a wet tent or leaky shanty, but while they were being built they prevented the production of useful machines or they prevented the works from being converted for the production of some other and still more useful commodity.

A Matter of Policy.

Apropos the conversion of aircraft factories to other purposes, there is a point which deserves the attention of the S.B.A.C., if the rumour on which it depends proves to be true. It is said that, in a praiseworthy effort to preserve the Trade alive, the Air Ministry's policy is to give what orders are permitted by the Treasury to firms which only make aeroplanes and have no other means of subsistence.

This would be the worst possible policy, for obviously the orders which are to be given in the future must be largely for experimental aircraft, and it seems fairly evident that the firm which has had the energy and independence and foresight to turn over part of its factory to an entirely new and paying business is precisely the firm which is likely to have the energy and independence and foresight to produce new and valuable types of experimental aircraft. On the other hand, any firm which, having made aircraft with more or less success, settled down into a groove to make aircraft and nothing else during this devastating Peace would be precisely of the kind which would find it most difficult to get out of its groove and produce anything of a progressive nature.

Moreover, a firm which was making money out of bassinettes for war babies or bath-chairs for wounded heroes would probably be inclined to spend money on

experiments in its aircraft department, and so would produce new types quickly. On the other hand, a firm which was dragging along on the little it could extract from Government orders would be likely to "ca' canny" and make those little orders last as long as possible.

So far as one can gather, every firm of note is laying itself out to make money out of some other business, so as to have money to spend on its aircraft work as soon as ever there is any sign of another aircraft boom, either in civil aerial transport or in the supply of aircraft to both or all the belligerents in some war in which we are merely benevolent neutrals. But there may be some firms which hope to exist solely on orders from the British Government. If so, they must either have vast political pull or an astonishingly optimistic management.

At any rate, there is the rumour as commonly circulated. If it is the Government's policy, it is just about as unsound as most of the other policies of politicians. There is no use in wet-nursing incapacity. If a firm can produce good things it should be supported. And it is well to remember that a firm which has a huge and well-organised factory, only part of which is concerned with the production of aircraft, can easily turn the whole factory onto aircraft in case of war, or of a boom in commercial aviation, whereas a small factory concerned entirely with aircraft has no immediate capacity for expansion of output.

EMANCIPATION.

Be that as it may, here we are to-day with the best-equipped Aircraft Industry in the World, free from Government hindrances in that it is not beholden to the Government for its support, free to tackle the markets of the World, free to fight Government interference with design or construction: as free, in fact, as a demobilised soldier who can give back-chat to his former regimental serjeant-major.

It is to be hoped that the Industry will make good use of its freedom. If it has the energy and initiative which belonged to its great ancestor the Shipping Industry, it will become one of the greatest industries in the World. If it sinks to the level of the motor trade and becomes small-minded, narrow, and self-satisfied, it will leave the World's markets open to German and American competitors. And then this paper, which for eight hard years has fought the battles of the British Aircraft Constructor, will have to grow fat on foreign advertisements and become dull and respectable. Which would be a horrible fate.—C. G. G.

ECONOMY AND CONSISTENCY.

The editor of the "Times" newspaper is evidently one of those who agree with the philosopher who said, "Consistency is the vice of fools." It was necessary to comment recently on an article in that paper which advocated that the Air Force Vote should be cut down from a matter of 25 millions of pounds to something in the nature of 12 millions. Also, that great financier Lord Rothermere stated definitely in his own paper that he could run an adequate Air Force on the latter sum.

Now we have the "Times," on Sept. 20th, holding forth against the Air Ministry for economising by stopping airship construction and by not spending money on Civil Aviation. The "Times" does not appear to attempt to reconcile its two articles, relying apparently on the ephemeral effects of its "thunder" in these days for absence of unkindly recollection of its previous tirade in favour of economy. Those who recall that tirade will be amused by the later effort, which reads as follows:—

AIRSHIPS.

A correspondent whose letter we printed yesterday attacked the Government's decision to stop airship construction—a bold line of attack at a moment when public opinion has hurried the Government into a typical con-

THE FIRST BRITISH WOODEN AIRSHIP.—H.M.A. R.31 was the first rigid airship constructed in this country, with a skeleton of wood, and was built by Messrs. Short Bros.

She is here seen over her shed at Bedford.

She has a length of 615 ft. and a total capacity of 1,550,000 cubic feet to lift 47 tons, and is fitted with five Rolls-Royce engines, totalling 1,500 h.p.

Running through the keel, there is a triangular structure of girders which forms a passage way, from each side of which there are suspended the petrol tanks, water ballast bags, and, in war time, bombs.

The Rolls-Royce engines are in five units, two in the forward car, two amidship, and one in the after car. The airscrews, each 17 feet diameter, are direct driven, and the engines amidships have a reversing gear.

The ship is divided into 21 compartments; in each of these is a gas bag. There is a clear air space between the outer cover and gas bags which tends to keep an even temperature.

vert's zeal for economy, especially economy of a spectacular kind. To stop airship construction is certainly spectacular, but whether it is economical or not is not so certain. Our correspondent denies that it will save much money, and if it will not do that it is extremely hard to justify. As long ago as last March we said that there was a real risk that the Treasury—in its necessity to ensure economy—might "follow the line of least resistance" and might "try to starve new Departments." That was at a time when the Government were disposed to treat attacks on their scale of expenditure with superb disdain. They know better now, but we are by no means sure that in stopping airship construction they have not done exactly what we feared they might do.

Airships will be most useful for some time to come as passenger or goods carriers in the new air taffic. They are predestined for the long air voyages which will bring the most distant parts of the Empire, and of the world, within the compass of a few days' journey from these islands. Their military value is small, for, though they are indispensable as fleet adjuncts, the possibility of naval actions is much more remote than that of a flourishing system of air transport. Such a system is certain within a very few years, and the airship is the indispensable craft for its wider ranges. If Great Britain does not lead the way in providing them some other country will.

France has repented quickly of a hasty decision to stop the construction of airships. The United States, unless report lies, is convinced of their value. Germany, if British experiments cease, still leads the world in the science of building them. The airships which were building when the Government interdicted the work were far in advance of the German models which the fortune of war had delivered into our hands. If they could be completed, and the others be built which are projected already, Great Britain would be pre-eminent in the craft of airship construction. No Power depends as the British Empire depends on quick communication between its States and Dependencies. But all this has not weighed with the Government.

Aircraft experiments are a young vintage of State expenditure without the fine bouquet of the recognised brands. Though that may not be the reason why retrenchment has fallen upon them, its hand at least has been ruthless.

General Seely, Under-Secretary for the Air, has intimated to the firms interested in the construction of aircraft that, "in the case of any well-founded scheme" of commercial air transport, airships will be sold "at a very cheap rate"; but this is a poor substitute for Government building, for expert opinion has never wavered from the conviction that it will be impossible for private firms to develop aircraft on a large scale without Government help, and the air liner will not be cheap to build.

Ill-fortune still dogs the steps of Civil Aviation in all its forms. The Air Ministry do nothing to help it, and this raid on airship construction is only the latest of a series of misfortunes.

Needless to say, one agrees with almost everything in this article, which is unusually ably written and shows close acquaintance with the subject. One need only add that General Seely's apparently generous offer is worthy of his peculiar mentality. To him, seemingly, any airship is an airship, and therefore suitable for any work for which an airship is suitable. He appears to be blissfully ignorant of the fact that no existing airship is of the slightest use for commercial purposes, except that the smaller non-rigids would provide excellent sport for what one may call "Blimp Yacht Clubs."

R.34, for all her record-creating performances, is useless, for she could barely carry petrol enough to take her and her working crew to America. She and the rest of her class have no margin for goods and passengers. Consequently, any commercial concern which bought any of the Government's rigid ships would be merely wasting money.

The only use for the airships now existing is as training vessels for the crews of the real commercial airships of the future. Or they would have a certain value for the elementary education of an infants' class of Admirals in their second childhood as to the first principles of the use of lighter-than-air craft in co-operation with a fleet in being. But now the Government has chosen to stop the construction of the first ships which might be commercially useful, influenced largely by the panic for false economy which has been caused by the daily Press.—C. G. G.

A THREATENED RESURRECTION.

The "Sunday Times," a paper which is usually more than well informed, stated on Sept. 21st that it is very probable that the Lord Rothermere will return to office, and suggests that he may go to the War Office in place of Mr. Churchill. The "Sunday Times" also says that at the War Office "Mr. Churchill has succeeded only in adding to his unpopularity."

As concerns the latter statement, one assumes that the paper quoted refers to Mr. Churchill's unpopularity with the uneducated or uneducatable public, for it is too well informed to imagine that Mr. Churchill is unpopular with the Staff at the War Office, with the Army, or with the Royal Air Force. At the War Office he is regarded as being mentally the greatest and personally the most acceptable War Minister of the present generation. In the Army and in the Air Force he is respected as a brave man physically and morally, and as a statesman who believes in and knows the value of the King's Armed Forces and is prepared to fight the mere politicians for the welfare of the Services.

Mr. Churchill is unpopular with a section of the public because, instead of calling on our troops to come scuttling out of Russia in obedience to the cry for economy, he insists that the British Government shall act as if they were gentlemen and shall keep their word to our Allies, the remnants of the Army of His Late Imperial Majesty the Tsar of All the Russias. It may be in our own interests to scuttle and leave our deluded Allies to be massacred by Bolsheviks, just as our Fleet scuttled out of Quiberon and left the Vendéeans to be massacred, for ultimately it is for the good of Europe that the Slavs should massacre one another to the greatest possible extent. But it is not the act of a gentleman to promise support to one party and then to back out and leave it to its fate. It is such acts as this that have won us the name of "*perfide Albion*" on the Continent.

Apart from which, it would probably pay us better in the end—and also the International Jew Financiers who pull the strings in all these so-called "Labour agitations"—if we kept the fires of civil war alight in Russia by supplying arms and ammunition, and a small volunteer army and air force, to the anti-Bolshevik forces, for in that way still more Slavs might be induced to massacre one another. Thus we might be able to postpone the time when goods produced with cheap Russian labour will undersell our home products and put all our workpeople out of work, and the later time when a rich and powerful Russia with a great leader and a well-organised army will conquer Western Europe and show our canting humbugs how to commit real atrocities on a big scale instead of in amateurish sporadic outbreaks as did the German troops.

If Lord Rothermere goes to the War Office and reverses all Mr. Churchill's policies, he will merely increase his own unpopularity among Army officers, and thus will end by upsetting the *moral* of the Army. If he takes on the control of the Air Ministry as well—as Mr. Churchill has done—it means death and damnation to the Royal Air Force, for it is fairly obvious that it would be impossible for him and Sir Hugh Trenchard to work together, and if Sir Hugh left the Air Force at the present critical time in its development it would mean that the whole spirit of the personnel would fall to pieces and that it would take years to re-establish their faith in the R.A.F.

That might be quite satisfactory to Lord Rothermere, who might be well satisfied by the economy effected in the pay list through the resignations of those officers who resigned in disgust; but it would not satisfy those who know Lord Rothermere's methods of running a fighting service, and who believe that a strong, loyal, and efficient Air Force is necessary to the safety of the Empire.

The alternative is that Lord Rothermere may take the War Office and let General Seely loose at the Air Ministry. That is perhaps preferable, for at any rate General Seely means well, and is honestly enthusiastic about aerial affairs. Moreover, it is possible for officers and gentlemen to work with him without fear of being intrigued out of their positions by the junior ranks of the Force.

It has been suggested that perhaps Lord Rothermere may go to the Admiralty. That seems to be the most suitable place for him, for his particular methods of running a Service department may commend itself to senior Naval officers. The fact that the rumour has been denied "from an authoritative source" does not lessen the prospects of Lord Rothermere's official resurrection.—C. G. G.

A USE FOR OUR AERODROMES.

Hunts County Council talks of buying Wyton Aerodrome from the Disposal Board.

The aerodrome, which is four miles from Huntingdon, occupies over 200 acres, and is equipped with many permanent buildings besides hutments.

It is suggested that the buildings might be used as a sanatorium and the land developed as a farm colony.

CIVIL FLYING

WITH

THE SOPWITH "DOVE" 2-SEATER SPORTING MODEL.

COMFORT AND ECONOMY

The Sopwith "DOVE" is a sporting and utility aeroplane, based, in point of design and general arrangement, upon the famous Sopwith "PUP."

With its fast climb, high-speed, quick manœuvrability and wide-speed range it is an ideal safety-first pleasure aircraft.

ECHOES FROM THE SCHNEIDER CUP.

The Aeronautical Correspondent of the "Times" delivered himself of the following conclusions concerning the Schneider Cup fiasco in the issue of that paper for September 12th :—

"The seaplane race held at Bournemouth on Wednesday was a great disappointment both to the general public and to industrial aviation.

"From the spectacular point there was no race at all, but two facts were very clearly brought home by the events of the day. The first was that the seaplane during the war has not progressed anything like as much as the aeroplane, and the second was that an aeroplane cannot efficiently be adapted for sea use by the substitution of floats in the place of wheels. It was demonstrated that a specially designed machine in the shape of a flying-boat was necessary.

"Both the British seaplanes broke their floats either in landing or taking off, both the French machines did the same thing, while the two competing flying boats experienced no trouble

"The exponents of the seaplanes agreed, after Wednesday's race, that the weather was all against them, and that owing to the absence of any wind it was necessary for the machines to attain such a great pace on the water before reaching their flying speed that their boats collapsed under the strain. This is certainly correct, but it shows that even in calm weather a machine designed for high speed and fitted with floats is a failure. On the other hand, in a wind they are also a failure, as a fresh breeze generally means a rough sea, and small choppy waves break the floats of a seaplane quicker than anything else. Floats which are made sufficiently strong to stand the strain are so heavy and cumbersome that their weight and resistance take off much speed, and it is evident that constructors, to get the increased speed for this race, tried a light float, which proved altogether too fragile. The fast seaplane, then, would appear to be altogether unseaworthy.

"There is little doubt that the only efficient machine for use on water is the flying boat, which is so designed that the fuselage of the machine while on the water forms a proper seaboat, and when the machine is in the air becomes a natural fuselage, offering very little more resistance than the fuselage of a land aeroplane."

A Seaplane Designer's Views.

The general inaccuracy of the statement of facts and the futility of the conclusions drawn therefrom have moved Mr. C. R. Fairey to produce, by way of protest, the following letter addressed to the Editor of the "Times"—

September 12th, 1919.

Sir,—

The conclusions drawn by your Aeronautical Correspondent in to-day's issue of the "Times" on the subject of seaplanes are so erroneous that I feel they should not remain unanswered.

In the first place his facts are entirely incorrect. None of the British Twin Float Seaplanes suffered damage to the floats with the exception of one competitor, and this, I believe, was done in avoiding a bather close in shore. Moreover, this was a machine built entirely for a speed contest.

On the other hand, one of the flying-boats entered damaged its hull in making the official landing, leaving the honours equal in respect of the two types. The failure of the race was entirely due to the weather conditions making it impossible to see the mark boat. The "Fairey" machine and the "Avro" (in reserve) both returned home in the evening, having made several landings without damage. Moreover, I would add that the "Fairey" machine entered for this contest has in fact made several hundred landings on the same floats and under various conditions. Having been delivered to the Government in July, 1917, it was re-purchased by us in March, 1919, having been in service during the intervening period, and the same floats are now on the machine as when originally delivered.

His remark that the seaplane has not advanced to the same extent as the land machine is also the exact reverse to the truth.

The land machine has not progressed at all; its improved performance is due to the great advance in engine design and construction. The 1913 "Avro" is still in production as a standard type and if fitted with a modern engine and strengthened accordingly would not differ in any respect from the most modern two-seater. The landing question with aeroplanes is further from solution to-day, in view of the advance in speed, than it was before the war.

On the other hand the seaplane has advanced to a very considerable extent. It has doubled its top speed, and although carrying a much greater load than its pre-war prototype it lands even slower and with much more safety.

While mankind has been rolling the turf for his aeroplanes nature has left the sea in the same condition as before. The seaplane can now deal with moderately rough conditions at sea. The modern land machine requires a more carefully prepared aerodrome than the cross-Channel Blériot of 1919.

The seaplane of to-day of equivalent performance to a similar land machine and in spite of the handicap of its sea-going gear, is carrying nearly 12 lb. to the sq. ft. of wing surface and 17 lb. per horse-power of its engine against the land machine's 7 lb. per sq. ft. and 14 lb. per horse-power.

Folding gear (Short), the variable camber wing, the flexible hull (Linton Hope), and the servo-motor for relaying controls (Cooper) are among the principal advances in seaplane design. America, with the retractable chassis, has made the only advance of consequence in aeroplane design.

The statistics in possession of the Air Ministry prove that the flying life of a seaplane is immeasurably greater than that of the land machine, the percentage of accidents and of lives lost per mile flown is beyond all comparison better than for the land machine.

The "Seaplane v. Flying-Boat" controversy was active in the R.N.A.S. some three years ago and has resulted in each type being relegated to its proper sphere, i.e., the flying-boat in large sizes for the trans-ocean routes and the twin-float type in smaller sizes for coastal work and use on rivers and lakes where its facility for manœuvring in restricted spaces and leaving the water quickly gives it the advantage.

In conclusion, I would state that at a time when the seaplane by its superior lifting capacity, its lower depreciation, its independence of prepared aerodromes and its immensely greater safety, appears in the eyes of many experts to be the only form of aircraft having an immediate commercial future it is unfortunate that the British Seaplane Industry should be the subject of such ignorant criticism, particularly in the pages of so responsible a journal as the "Times."

(Signed) C. R. Fairey,
Chairman, The Fairey Aviation Co., Ltd.

A Few Comments.

Both the "Times" article and Mr. Fairey's letter call for further comment, apart from the fact that so far as one has seen, the "Times" has not had the courtesy to publish Mr. Fairey's *démenti*.

Mr. Fairey has dealt fairly adequately with the absurd statement that "the seaplane has not progressed anything like as much as the aeroplane," but he might have asked the "Times" "expert" to explain wherein lies the difference between the float seaplane and the land-going aeroplane except in the substitution of floats for wheels. Any progress in aerodynamic design, constructional detail, or engine efficiency made by one has been at once available for the other.

He might also have explained that so far from "a specially designed machine in the shape of a flying-boat" being necessary, a float seaplane is the only type of small seaplane which can be used in a rough sea. Flying-boats, though excellent for lake and river work and for smooth water, are only usuable in really rough water in their larger sizes, owing to the fact that in the smaller sizes the whole boat and the lower planes are submerged by any considerable wave.

As to the further inaccuracies of the "Times," no machine broke its floats in "taking off," and only one British and one French machine did so in alighting. The other French machine stove in a float on a stone in "landing," in the literal sense though not in the sense intended by the "Times" "expert." Incidentally, one does expect moderately accurate language in a paper of the standing of the "Times," and so one is somewhat surprised to find the paper's expert writing of "landing" on water.

The statement that "the exponents of the seaplanes agreed . . . . that owing to the absence of any wind it was necessary for the machines to attain such a great pace on the water before reaching their flying speeds that their boats collapsed under the strain" is entirely false. The seaplane people did not and never would agree to such a ridiculous statement. The floats (which the "expert" is here pleased to call boats) of two machines only collapsed on alighting, because they were built specially light for racing, and because, owing to the absence of any wind, the machines had to come down at flying speed on water as smooth and hard as glass.

Contrary to the belief of the "expert," as expressed by the word "even" in the next sentence, those same floats would have stood up to their work perfectly well if there had been a breeze and a slight sea to give them some braking effect in alighting. The benighted ignorance of the "Times" expert is shown by his last paragraph, for if he knew anything at all about sea-flying he would know that in the smaller sizes up to, say, 350-h.p., the float seaplane can actually lift bigger "useful loads"—that is to say, more bombs or more passengers or more fuel—off the water than can a flying-boat of the same power, and can fly faster with equal loads. The flying boat scores all round in the bigger sizes, and in the smaller it has the advantage in comfort for the crew when in the air, and in ease of handling when in tow or under power on smooth water.

So far as Mr. Fairey is concerned, he is guilty of one inaccuracy, namely, in stating that one of the flying-boats

"damaged its hull in making the official landing." That was the general impression on the day of the race, while the Supermarine people were busy salving the boat. It was not till later that they had time to make known the fact that the bottom was torn out of the boat by some kind of flotsam in Swanage Bay, where the pilot had alighted in the hope of finding the mark-boat.

On the whole both the float machines and the flying-boats come out of the Schneider Cup fiasco with less damage to their reputations than either the Committee of the Royal Aero Club or the "Times" seaplane "expert."—C. G. G.

An Engineer's Opinion.

The following letter from one of the pioneers of British Aviation is of particular interest :—

Sir,—I have read with considerable interest your scathing attack on the organisation of the Schnieder Cup, and I must say that you are more than fully justified in your remarks. One thing I noticed in your report was the consistent failure of all the float machines used due to the bursting of the floats fitted.

Until manufacturers of high speed seaplanes appreciate that it is quite impossible to manufacture a rigid float which is both light and strong, no progress can possibly be made with this type of machine. It is quite possible, however, to construct floats which are resilient and at the same time keep their shape sufficiently to enable the machine to plane off the surface of the water.

Mr. Turnbull has invented and patented such a float which would satisfactorily overcome this trouble. In carrying out tests with an experimental float which we constructed it was possible to pick up the float by one end and use it as a flail against any hard object without damaging the float in any way. The planing surface of the float is perfectly rigid and also the attachment to the machine. It is practically impossible to burst the float or puncture it so that it would leak.

At the time of the Armistice floats of this type were being made for the Admiralty, but the order was cancelled with the cessation of hostilities.

If any high-speed seaplane maker is interested in the matter we should be happy to supply him with details of the invention and permit him to make a pair to suit his machine under the nominal license of half a guinea, and we are sure that if there is any manufacturer who will avail himself of this offer he will be in a position, anyhow as regards his floats, to compete with success in the next Schneider Cup race or any other seaplane speed competition.

A point which I have not mentioned so far is that the floats can be made in perfect streamline form and so reduce head resistance considerably.

(Signed) E. C. GORDON ENGLAND.
(Director) p.p. England & Turnbull, Ltd.,
193, Regent Street, W.1.

The French View.

The following letter gives the French view of the Aero Club's muddled management :—

Sir,—The French pilots and the Aero Club authorities here are very much in favour of the prize being given to the Italian aviator, and the chief argument they are using is that if he did not complete the course it was because the Avro which undertook to point out the course before the race went round the particular mark boat which was used by the Italian pilot for the 10 circuits he made.

It is openly said that this was purposely done by the Avro, and a considerable harm to British aviation in general has been done by the way in which this race was organised and conducted.

Indeed, I should not be surprised if the effect is to keep British machines and engines out of this market for the whole of next year, and as this is bigger than the British market the effect would be very much felt.

Your article in the current number has just the right tone to clear the air. "PARISIAN."

Concerning Engines.

The following letter has been received :—

Sir,—Owing to the number of conflicting reports which have been circulated regarding this race, held on Wednesday last, I have made careful examination to ascertain the cause of the British competitors', and particularly the two fitted with 450 h.p. Napier aero engines, not completing even one lap of the course.

I understand that the trouble was due to the bad visibility in the neighbourhood of the Swanage mark-boat, which the competitors had to circle, and which could not be found by any of them.

The Supermarine flying-boat, which was fitted with a 450 h.p. Napier aero engine, ran into a mist over Swanage Bay; the pilot lost his bearings and made a landing in Swanage Bay in order to ascertain his position. Upon taking off, the machine hit some wreckage, and the pilot did not know the extent of the damage until landing near Boscombe, where he tried to beach his machine.

It is regrettable in the interests of aviation generally, and particularly British aviation, that this race was allowed to commence without ascertaining the extent of the mist over the whole course, and thus turned the race, which should have been of great assistance to aviation, into a fiasco, which might do incalculable harm to the progress of the British Seaplane Industry.

I understand that both Napier engines were running perfectly in the British machines when on their trials.

(Sgd.) H. T. VANE,
Managing Director, D. Napier and Son, Ltd.

The Handling of Seaplanes

A reader of THE AEROPLANE states that in his opinion the breakages to the floats of certain machines in the Schneider Cup competition were due to an error of judgment on the part of the pilots. The pilots somewhat naturally endeavoured to bring their machines onto the water as slowly as possible, but owing to the absence of wind this speed was very high in spite of their efforts. The result was that the tails of their floats hit the water fast at a large angle, with the result that the front of the floats slapped down onto the surface so hard that the bottoms were knocked in. In his judgment it would have been better if the pilots, instead of trying to make a slow partially stalled alighting, had deliberately come down fast in a flying position. In this case the floats would have skimmed over the water until the speed was reduced instead of hitting it flat. The theory is worth consideration by pilots of racing seaplanes.

Pleasing Recollections.

One who was present at the Schneider Cup fiasco remarks that it quite reminded him of the old days of flying competitions in 1909 and 1910 because there was no flying and no organisation.

In his opinion the noise of the aeroplanes and their engines and the rules and regulations restricting free circulation on aerodromes in these days completely spoils what would otherwise be very pleasant social gatherings.

An Unfounded Impression.

Many spectators at the Schneider Cup fiasco were anxious to know the meaning of the letters "G—EAKI" on the Sopwith machine. It seems well to explain that they do not represent an aboriginal Australian war-cry adopted by Mr. Hawker, but that they are merely the Air Ministry's idea of an identification mark.

A Consolation Race.

It is announced in the Royal Aero Club official notices on page 1196 that a race will be held for seaplanes in October for a handsome prize. It will be remembered that a suggestion to this effect was made in THE AEROPLANE last week. The prize of £500 should produce several new entries, and the sportsmanship of Lieut.-Col. McClean, the father of British Naval Aviation, in putting up a £100 cup adds materially to the interest in the race. The conditions of the race are worth studying.

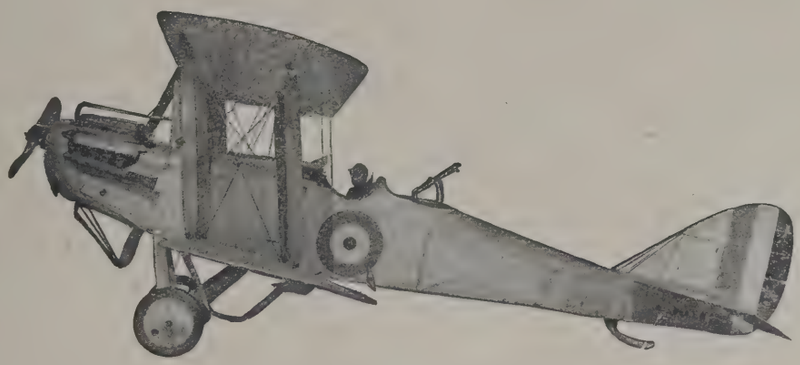
THE AIRSHIP EXHIBITION AT PRINCES GALLERIES.

Since the opening day the number of exhibits has been increased by a very excellent collection of photographs and models kindly loaned by the Italian Government. Also there are now very many more additional models, pictures, etc., from various sources in this country. The exhibition, on the whole, is quite one of the best shows of its kind yet seen, and one is glad to hear that the attendance has improved immensely since the first few days.

Owing to the little idiosyncrasies of the Police regulations, a very novel form of advertising arranged for the opening day was barred, so that the only intimation that the exhibition was opening appeared in the usual out-of-the-way portions of various newspapers.

Unfortunately, the position and size of the Galleries prevent the showing of any full-sized aircraft or parts, barring a few interesting relics of the past, such as the fuselages of the first Santos-Dumont and the Spencer airships, so that by far the best feature of the exhibition is found in the exceedingly fine collection of photographs loaned by the British, French, and Italian Governments, and also a series of paintings by Capt. A. E. Cooper, illustrating some of the work of the Airship Section of the R.N.A.S. and R.A.F. during the war.

A large quantity of models illustrates practically every type of lighter-than-air craft built by the various Allied Governments during the war, as well as a number of post-war designs projected by various firms, who, fortunately, realise the vast amount of possibilities of airships in connection with long-distance travel and exploration.



One can only repeat that it is to be earnestly hoped that the expectations of its promoters will be handsomely exceeded not only in realising a suitable profit to hand over to the St. Dunstan's Home for the endowment of an "Airship Bed," but also, in bringing before the public the great possibilities of the airship.

The Proved Best.

NAPIER

British Built.

AERO ENGINES.

For Reliability, Speed and High Altitudes, the Napier Engine has proved its claims by—

¶ On 2nd January, 1919, a NAPIER engined Airco Aeroplane attained an altitude of nearly SIX MILES UP IN THE AIR.

¶ On 21st June, 1919, a NAPIER engined Airco Aeroplane was first in the Aerial Derby—open to all comers—average speed in a closed circuit 129.3 m.p.h., creating a BRITISH RECORD granted by the Royal Aero Club.

¶ On 31st July, 1919, a NAPIER engined Alliance Aeroplane made the first direct non-stop and fastest flight from London to Madrid.

May we send you a copy of our illustrated brochure No. 40, giving full particulars of this successful engine ?

Works—LONDON.

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

The Meteorological Conference.

A conference of meteorologists of the British Dominions will be held in London next week. The official meteorologists of Australia, New Zealand, South Africa, Canada, India, Ceylon, and Egypt will be present. The programme, as at present drawn up, opens with a reception at the Meteorological Office on Monday evening. On Tuesday, in the rooms of the Royal Society, Col. Blandy, D.S.O., R.A.F., Controller of Communications, will speak upon the transmission of weather reports by wireless, and there will be a visit to the radio-telegraphic receiving and distributing stations of the Air Ministry. Kew Observatory will be seen on Wednesday. On Thursday, during the morning, the delegates will visit the Kite Balloon Station at Kingston Hill, and in the afternoon the R.A.F. Meteorological Station at Bedford.

Other visits during the week include the Admiralty Meteorological Station, the British Rainfall Organisation, and the Aerological Observatory at Benson.

The Leon Morane Altitude Prize.

The late M. Léon Morane, whose modesty and charm of manner endeared him to all, told his brother some years ago that he intended to found a prize which should bear his name. He died before his intention was put legally into effect, but M. Robert Morane has loyally carried out his dead brother's wish.

He has presented to the Aero Club de France 10,000 francs and a Cup to be entitled the Challenge Léon Morane. The Cup will be awarded to the French aviator for the French height record gained on a French-built single-seated aeroplane. It will become the definite property of the French aviator who holds the record for a year at least. The 10,000 francs prize will be awarded to the definite holder of the Cup.

The period during which the present regulations are effective is from Oct. 19th, 1919, to Oct. 19th, 1923. If, at the latter date, nobody has won the Morane prize, the Cup and a prize of 1,500 francs will be given to the last French holder of the French height record. The 10,000 francs unawarded will then be competed for under new regulations.

A Spanish Race.

The British Chamber of Commerce at Barcelona announces that the forthcoming Spanish aeroplane race will be open to Spanish aviators and to foreigners resident in Spain for more than one year. Other foreign pilots can enter, but without any right to the prizes in the contest. If more than three enter special prizes will be allotted. The trial will be entirely one of speed. The course will be as follows: Prat de Llobregat, Barcelona, Badalona, Sabadell, Tarrasa, Tibidabo, Barcelona, Prat de Llobregat—a total of 110 kilometres.

Entries are free, and must be made by Sept. 30th. The British Chamber of Commerce will be pleased to enter any pilot of British nationality who wishes to take part in the race.

Prizes for Portuguese and Brazilians.

A prize of £300 for the first Brazilian or Portuguese military aviator to fly between Lisbon and Rio de Janeiro is proposed in a resolution that has been introduced in the Brazilian Chamber of Deputies. The measure calls for the Government to finance preparations for the flights up to an amount not exceeding £30,000. It is provided that the flight shall not require more than 168 hours.

The Portuguese Government on June 6th offered a prize of approximately £6,700 for the first Portuguese or Brazilian aviator to fly from Portugal to Brazil.

34,610 Feet.

It is claimed that Mr. Roland Rohlfs, in a Curtiss K.12, on Sept. 18th broke the world's altitude record by rising to a height of 34,610 ft. in a 400 h.p. Curtiss triplane. He attained over 34,000 ft. last week, but the flight was unofficial.

The flight was observed by officials of the Aero Club, who sealed Mr. Rohlfs' instruments when he landed and sent them to Washington for verification. The pilot reported that he experienced trouble in breathing at 20,000 ft., being obliged to use his oxygen bottle. At the top of the climb the thermometer registered 43 deg. below zero. At 31,000 ft. the machine frightened the pilot by its antics, finally dropping 600 ft. vertically, as recorded by the barograph. Mr. Rohlfs reached his record height in 78 min.

Balloon v. Aeroplane.

As claims are being made for new altitude records almost every week one begins to wonder how long it will be before the heavier-than-air record equals the balloon record with passengers. As already announced, Mr. Roland Rohlfs, one of the Curtiss Co.'s testing pilots, claims to have ascended to a height of 34,610 ft.

In September, 1862, Coxwell and Glaisher ascended in a balloon to a height of 37,000 feet.

Aeronautics at the Polytechnic.

The Polytechnic, Regent Street, announces that a series of evening classes dealing with aeronautics will be instituted during the session 1919-20.

The Syllabus, which has just been issued shows that a complete course of instruction in aeronautical engineering has been laid down, which is to be completed in three years, and which very completely covers the whole field, including the history of aviation, mathematics, aero-mechanics, the principles of aeroplane, airship, aero-engine and airscrew design, draughtsmanship, and the principles of practical construction and of workshop practice.

The reputation of the Polytechnic, and the fact that Major T. Worswick, O.B.E., M.Sc., A.F.R.Ae.S., late R.A.F., is the Assistant Director of Education of this institute, should be a guarantee that this new branch of its activities will be well and efficiently operated.

Intending students should note that the head of the Engineering Department and the teachers will be in attendance at 307 to 311, Regent Street, from 6.30 p.m. to 9 p.m., every evening between Sept. 22nd and Sept. 26th to advise upon the choice of classes.

A Banquet.

Mr. Handley Page was the guest on Saturday, Sept. 20th, at a banquet given by his fellow-townsmen at Cheltenham. The proceedings were arranged by the local Chamber of Commerce and Traders' Association, and its president, Sir James Agg-Gardner, M.P., was in the chair.

The toast of "Our Guest" was proposed by Mr. Oliver J. Williams, who in the course of his speech likened Mr. Handley Page to Hermes, the messenger of the gods, to Mercury, the man who travelled from continent to continent, and even to Ganymede, the "page" of the gods.

Their guest, he said, had taken a great part in revolutionising not only the art of war, but transport all over the globe. If it had not been for the German army cracking up at the moment when we least expected it, they knew that the Handley Page machines would have given Berliners a lesson that they would never forget. Thanks to the efforts of such men as their guest, the air machines would in the future take the place of the ordinary passenger steamer and the railway train.

Mr. Handley Page, who received a very hearty reception on rising to respond, paid an eloquent tribute to the services of the Royal Air Force in the war. At times, he said, the officers would say that they had the rottenest machines, but, in spite of everything, they could depend upon the men always, and the same courage which won Trafalgar won the last battle in the air.

He had hoped that they might bomb Berlin, and the machines were ready. They had hoped the Armistice would not be signed for a day or two, but what was to them a disappointment became pleasure and joy to many thousands, as it meant the avoidance of further bloodshed.

They had been able, however, to take the machines to the capital of Afghanistan, and show there what they could have done to Berlin. But those engines of war could easily be transformed into engines of peace, and to-day they were sending machines daily to and from Paris. He felt that such easy means of communication would be the best means of preserving peace in the future, as it would prevent international misunderstanding. The best League of Nations would not be built up by paper, but by aeroplanes.

A Rumour.

The rumour that the Department of Civil Aviation will soon be incorporated in the Ministry of Transport is being much discussed. The general opinion is that the immediate result would be a fresh crop of hampering regulations.

Government Aircraft Competition

An important clause in the £64,000 prize conditions.

"16. Soundness and quality of construction will include—

(a) Fire protection, including use of self-sealing tanks (from the point of view of safety from fire in the event of a crash), fire fighting appliances and accessibility of same."

The only self-sealing tank

in use and approved by H.M. Government is the

Imber Tank

(Patent No. 122853)

The Patent Rights of this tank are held by the Imber Anti-Fire Tanks, Ltd., who are now ready to consider with the designer of machines an installation of the Imber device.

The WORLD of AERONAUTICS

The Australian Government Competition.

The following communiqué was received from the Air Ministry on Sept. 19th :—

The flight for a prize of £10,000, which was offered by the Australian Government in March last was the subject of a Conference to-day between representatives of the Air Ministry, the Australian Commonwealth, the Royal Aero Club, and the competitors.

It has always been recognised in official quarters that a flight between England and Australia would be a performance of very great difficulty in the present state of ground organisation, and that considerable time must necessarily elapse before the project could mature. Since little information was available on the proposed line of route beyond Calcutta, it was decided jointly by the Commonwealth Government, the Air Ministry and the Royal Aero Club that no competitor should be allowed to start until the Air Ministry had been able to obtain reliable data concerning the section of the route between Calcutta and Port Darwin.

Brig.-General A. E. Borton, D.S.O., and Capt. Ross-Smith, of the Australian Flying Corps, were accordingly dispatched without delay to carry out a special survey of this section, and to report on the possibility of the flight being successfully attempted. These two officers have now returned to England, and to-day furnished detailed information regarding their investigations. They reported that beyond Calcutta the route lies over country far from favourable for aeroplane flying. Between Calcutta and the Dutch East Indies the only landing grounds suitable for immediate use are the Race Courses at Rangoon and at Singapore. Beyond Singapore, where the route lies over the Dutch Islands, the next place where good landing facilities exist is Bandoong, and thence no landing ground is at present available for the intervening 1,760 miles to Port Darwin.

As the weather after the end of November is most unfavourable, General Borton expressed the view that if the flight is to be made this year only aeroplanes possessing a range of at least 2,000 miles could make the attempt with any hope of success. He explained also, that the difficulties would be considerably lessened if competing machines were fitted with floats at Calcutta and continued the journey as seaplanes, as there are several suitable harbours and inlets on the route to Australia.

With regard to the portion of the route between London and Delhi the same difficulties do not present themselves, as the organisation created by the Air Ministry for Service flights is meantime available. Owing to the weather conditions after the beginning of November, however, it may be necessary for competitors to fly via Malta and the North Coast of Africa to Cairo. From Cairo to India the difficulties to be faced are greater, and vast stretches of uncivilised country have to be traversed. Although more than one flight has been made over this portion of the route, it cannot be said to be in regular operation.

The Air Ministry have placed all available information at the disposal of competitors, and are arranging for the granting of such facilities as have been created and exist, and to keep competitors posted with any progress or developments.

Flying and Tennis.

A correspondent writes :—

I used to like aeroplanes; before the war I invariably rode a push-bike from London to Brooklands to watch the flying every Saturday and Sunday. I still rather like aeroplanes (both flying them and watching them), and people think me a damned fool because I always rush to the window with a pair of field-glasses every time I hear a machine; in fact, I used to have a very busy time with my squadron in France owing to this habit of not being able to hear an aeroplane without wanting to see it.

Lately I have started playing in tennis tournaments. Doubtless, many readers who are cricket enthusiasts will recognise the identity of the batsman who would never play at Lord's because he was quite certain that as soon as he was called upon to face the bowler from the pavilion end someone in the pavilion would get up and take his hat off to an acquaintance which would catch his (the batsman's) eye, and, if the ball was a straight one, he would be bowled.

I have every sympathy for that man. This week I have been playing tennis at Eastbourne. Every time I threw a ball up for a serve I expected to see, and very often did see, either a land or seaplane belonging to the E.A.C. cross my line of vision; of course, this distraction usually caused a fault. Possibly someone will say that it is the same for all; perhaps it is. But, personally, I think it affects some people more than others; for myself it is sufficient to take my eye off the ball to hear an aeroplane near me.

Here let me say that I do not blame the pilots, since during the whole meeting no machine actually flew within three hundred yards of Devonshire Park, and certainly no one repeated the performance of the gentleman (alleged) to whom reference has already been made by me in a previous number of THE AEROPLANE who tried to get a free view of the tennis at Wimbledon from a machine.

From what I know of Major F. B. Fowler, if the Committee had 'phoned him and asked him to keep his machines to the east side of the pier when flying at a height of under 5,000 ft., I am quite sure he would have been only too pleased to comply.

I know that the seaplane which was the worst offender very much interfered with everyone's game, and, as a competitor remarked, "They should shoot the blighters down before each match."

Seriously speaking, though, there is no doubt that a machine in the sky interferes considerably with any game in which eye and concentration are needed, and pilots would do well to keep as far away as possible from all cricket matches, tennis tournaments, etc., since interference with games will do more harm to flying and make it unpopular far quicker than any other way.

There is nothing that upsets the average Englishman more than interference with his games. Certainly, it has provided me with an excellent excuse when asked by friends why I was beaten in the first round of all events!—G. D.

A Projected Airship Scheme.

A "Daily Express" correspondent at Selby, Yorks, understands that Armstrong, Whitworth, Ltd., will shortly submit to the Government a scheme which, if adopted, will mean pushing ahead at once with the construction of giant commercial airships.

The type of air-liner they have designed and are prepared to build is the last word in luxury and efficiency. These ships, built entirely of steel, and equipped with saloons, dining-rooms, smoke-rooms and sleeping cabins, would have a carrying capacity of between sixty and seventy tons, and a gas capacity of about 3,500,000 cubic feet. They would be able to do a 6,000 mile trip without trouble of any kind.

An improved airship engine, combining speed with reliability and endurance, is being designed, which should give the airships a speed of at least eighty miles an hour.

The Cambridge Flying Club.

A flying club is to be formed at Cambridge intended principally for undergraduates who have served in the R.A.F., and who wish to continue flying. The necessary arrangements are being made by the Cambridge School of Flying, and it is hoped that when the men return next term at least 100 will join.

It is understood that H.R.H. the Prince Albert has promised to make use of the aerodrome if he requires it while in residence.

The machines to be used are Avros and D.H.6's, but negotiations are in progress for insurance, and it is possible that D.H.6's only will be used. The Secretary of the Cambridge School of Flying and Aerodrome Co., Ltd., is Capt. J. L. Lee-Jones, B.A., Oxon, whose address is 2, Downing Street, Cambridge.

"Popularity Jack."

From the "Daily Mail" of Sept. 22nd :—

"At a reception to returned soldiers at Langley Mill, near Ilkeston, on Saturday night, General Seely, the Under-Secretary for Air, accepted a challenge by the vicar, the Rev. H. Gilgryst, to sing, the audience to adjudicate. The vicar sang the 'Anchor's Weighed,' and General Seely followed with 'John Peel,' accompanying himself at the piano.

"The verdict of a draw was received with applause. Each was presented with a box of chocolates."

[One commends to the Under-Secretary of State for Air a study of the gentleman of whom Herodotus relates that by way of showing his appreciation of a banquet he stood on his head in the middle of the table and waved his legs in the air. —Ed.]

The Economy Campaign.

Some officials have enjoyed a laugh at the expense of Mr. A. R. Atkey, M.P. for Central Nottingham, who caused a stir in the House recently by asking whether a new anti-aircraft gun was being erected on Wilford Hill.

It has now transpired that the gun, which was seen being placed in position at Wilford, had been to Leicester to fire the Royal salute on the occasion of the King's visit to the city.

Summary of First Month's Flying.

August 25th, 1919, to September 20th, 1919.

Flights Scheduled	56
Flights accomplished	54
Prevented by weather . . .	1
Interrupted by mechanical defect	1
Number of Miles flown . .	13,750
Average Speed (Miles per hour) .	106½

The following is an official summary of the weather flown through during the month.

Days favourable for flying	3
„ unfavourable for flying . . .	13
„ noted officially as "unfit" for flying .	8

Only once, when the wind attained a velocity unknown for years, was it necessary to abandon a flight; and even then, though there were squalls of 100 miles an hour strength, only one of the two Daily Services was suspended. Though the machine from London did not start, the one from Paris not only started but arrived at Hounslow before its scheduled time.

NAVAL & MILITARY AERONAUTICS

GREAT BRITAIN.

[The Official Gazettes, Honours Lists, and Personal Notices will be found on page 1203.]

THE PEACE TERMS TO BULGARIA.

The Draft Treaty of Peace was handed to the Bulgarian Peace Delegates in Paris on Sept. 19th. Part X—Aerial Navigation—is identical with Part X of the Austrian Peace Treaty.

PART IV.—MILITARY, NAVAL, AND AIR.

AIR.

The air clauses provide that the armed forces of Bulgaria must not include any military or naval air forces. The entire personnel of the air forces in Bulgaria is to be demobilised within two months.

The aircraft of the Allied and Associated Powers is to enjoy full liberty of passage and landing over and in Bulgarian territory until the complete evacuation of that territory by the Allied and Associated troops.

The manufacture of aircraft and parts of aircraft is forbidden for six months. All military and naval aircraft, including dirigible and aeronautical materials, are to be delivered on the ratification of the present Treaty.

NAVAL.

ADMIRALTY APPOINTMENTS.

The following appointments have been made:—
Sept. 17th.—Gnr.—H. A. Haynes, to "Argus," Sept. 16th.
Sept. 19th.—Lieut.—D. C. Sealy, D.S.C., to "Argus," Sept. 18th.
Sept. 20th.—Art. Engrs.—A. Lambert to "Ark Royal," Sept. 19th.

THE CASUALTY LIST.

Reported Sept. 9th.

WOUNDED.—Maj. A. C. Barnby, R.M.L.I.

MILITARY.

OFFICIAL COMMUNIQUE.

The War Office issued the following communiqué on Sept. 19th:—
The Bolshevist fleet of 15 vessels which sailed north-east from Petrozavodsk to intercept one of our columns which was being landed on the west shore of Lake Onega was attacked by our aircraft with machine-guns and bombs and forced to return to its harbour in confusion.

THE CASUALTY LIST.

Reported Sept. 22nd.

PREVIOUSLY REPORTED MISSING, NOW REPORTED KILLED.—Muir, Sec. Lt. J. W., R.F.C.

OPERATIONS IN RUSSIA.

Kronstadt was bombed on Sept. 13th and again on Sept. 14th by British aviators. In the first raid, although the aeroplanes were subjected to a severe bombardment, all returned. In the raid of the 14th one of the aviators was forced to descend in Finland owing to engine trouble. In both raids hits were observed.

Another account states that the pilot of this machine, which the account says fell into the sea near Bjorkoe, was drowned.

Kronstadt was again raided on the night of Sept. 15th by the British, thus making the third raid in succession.

* * *

News of another attack on the 17th-18th states that both fighting and bombing aeroplanes took part in this raid. The weather was bad; there were both rain and wind and the night was dark. One of the fighting aeroplanes met with an accident when starting and fell into the sea. The pilot was killed. Two other machines of unstated types came down later and their crews are missing. The remaining machines reached their objective.

* * *

Another air raid was carried out upon Kronstadt on Sept. 19th, sixty aeroplanes taking part. Many fires were observed, and the anti-aircraft defences were active.

THE RAID ON KABUL.

Reuter's correspondent at Simla communicated the following to the Press apparently upon Aug. 16th, although it has only just been published. One can find no previous record of the appearance of this account:—

It is interesting to learn that the aeroplane which a few months ago bombed Kabul was the Handley Page machine in which General N. D. K. MacEwen, C.M.G., D.S.O., came out to India from England in January. It will be remembered that in March last, after the machine finally arrived at Delhi, after many vicissitudes, Captain R. Halley, R.A.F., piloted it to Ambala and Lahore, and afterwards to Risalpur.

It was from Risalpur on May 24th that Captain Halley, with Lieut. Villiers, R.A.F., as observer, started to attack Kabul. The machine left Risalpur about 3 a.m. on its flight of nearly 400 miles. Owing to the great heat and atmospheric conditions considerable difficulty was at first experienced in getting it to rise to the required height. Having succeeded, it proceeded across the Khyber and followed the River Kabul to Jellalabad, in which city the effects of bombs previously dropped by other machines were plainly visible. Thence it flew straight to Kabul, having to ascend about 8,000 ft. to cross one high ridge.

A good deal of difficulty was experienced from air pockets. Kabul was reached about 6.30 in the morning. The machine had good luck in one direction, in that it made its voyage to Kabul with a tail wind, and after it had accomplished its journey the wind immediately changed round and assisted it to make its return journey. This fact probably lessened the time of the flight by at least an hour and a half.

After arriving at Kabul the Handley Page descended to some 1,600 ft. above the city, which is situated at about 6,000 ft. elevation. The whole visit over the city only lasted some ten minutes. The aviators saw large numbers of people rushing about in alarm. Several big bombs were dropped, apparently with considerable success, on the arsenal buildings. The great Bala Hissar Fort stood out very prominently among all other structures.

The Handley Page finally returned to Risalpur, thus accomplishing one of the longest and most difficult air raids yet carried out by the Air Force. Moreover, this was really the first time that a four-engine Handley Page had taken part on active service. Having accomplished such an extremely hazardous flight as it made last January from England to India, the greatest credit is due to the pilot and crew for navigating the machine through such a difficult, unknown and treacherous country as Afghanistan. There is little doubt from reports which have since filtered down from Kabul that the aeroplane's visit to the capital had an extremely important effect both from the military and political point of view, and at the recent conference at Rawalpindi more than one of the delegates confessed that the Afghans had been deeply impressed by the air raid.

A RESOLUTION OF THANKS.

At a meeting of the City of London Corporation on Sept. 18th Alderman Sir William Treloar moved the following resolution:—

That this Court desires to record its appreciation of the effective measures taken for the defence of London on the occasion of the many raids by enemy aircraft during the war, and especially on the night of May 19th, 1918. This Court wishes to express the great indebtedness of the citizens and inhabitants of London for the untiring devotion and splendid services of the pilots, airmen, gunners, and others engaged under the command of Major-General Ashmore on the night of May 19th when not only were seven of the enemy machines brought down, but so much further damage was done to the enemy that the Germans finally decided to abandon attacks on London.

The resolution was carried.

THE WAR MEDAL.

The decision of the War Office to award the British War Medal to Y.M.C.A. workers who served in any of the war areas and to allow those who served overseas between August, 1914, and Dec. 31st, 1915, has been received with mixed feelings. Some people do not think it quite fair that a flying instructor who was not allowed to go overseas because he was too useful and who risked his life trying to train dud huns in England should have no medal, whereas the man who handed out tea in a Y.M.C.A. hut at a pleasant sea-coast town base a day's journey from the front should be given the honour of wearing the ribbon that is supposed to denote that the wearer has risked everything for his country.

However, there is so much unfairness in these matters that one cannot imagine how any really good man who knows that he has done his duty can worry about such things.

AIR FORCE.

The R.A.F. Recruiting Campaign.

It is officially stated by the Air Ministry that although it is only a few weeks since the R.A.F. opened its special recruiting campaign recruits have come forward in such numbers that the Force is now up to its present authorised strength.

Accordingly, all recruiting has now been suspended except for carpenters, cooks, and clerks, for which trades a certain number of vacancies still remain.

The attractive new conditions of service and rates of pay are, of course, largely responsible for this satisfactory result, and the authorities are extremely pleased with the class of men who have come forward.

As the number of applications still being made show no sign of diminishing, men of the trades for which vacancies still exist and who desire to enter the R.A.F. would be well advised to apply without delay.

The Relinquishment of Aerodromes.

The Air Ministry announces that it has been decided to relinquish and dispose of the following Royal Air Force Stations, and arrangements are being made accordingly :—

Wight, Cowes (aerodrome), London Colney (aerodrome), Beaulieu (aerodrome), Lydd (balloon school), Dover (seaplane station, temporarily transferred to the Admiralty).

The London-Bombay Service.

Lieut. Crichton, R.A.F., and Lieut. Coombs, R.A.F., who arrived at St. Raphael (Var) on Sept. 13th, left there for Taranto on Sept. 15th. They are visiting Taranto in connection with the proposed London to Bombay aerial service.

An Accident at Simla.

A telegram from Simla states that an aeroplane, while trying to land in the Residency at Quetta, fell to the ground and burst into flames. A passenger, Capt. Steele, and two Brahmins were killed. The pilot, an officer of the Royal Air Force, was severely shaken.

On Air Stations in Particular.

It was recently one's good fortune to see two of His Majesty's Royal Air Stations in being—or rather in that state of being that is permitted them by an economical daily Press. In these days of Peace, so quickly are the Services forgotten that it appears to be well to draw the attention of the general public to the fact that there are still air stations at Lee-on-the-Solent and Calshot, and that, weather permitting, there is flying done at these stations.

Lee-on-the-Solent is an air station which is extremely anxious to disclaim any connection with the Navy. Being a seaplane training station, naturally practically all the staff are late R.F.C., although the O.C. is a former R.N.A.S. officer.

Lee-on-the-Solent is an awkward place to get at, but when reached is well worth the trouble. From the strictly naval atmosphere of Portsmouth Harbour, through the equally strictly military one of Gosport, out—at length—to such a distinctly Air Force atmosphere as Lee-on-the-Solent, gives one a very good impression of His Majesty's Three Services.

Lee is a pretty place, but too quiet. The inhabitants, having nothing to do, talk R.A.F. scandal all day. Be that as it may, no inhabitants appeared on the afternoon in question, and having presented the pass one proceeded on a tour of inspection.

One was taken round the shops and the sheds. Short folder seaplanes, Norman Thompson flying-boats, and an experimental Sage two-seater—which is "quite fast"—were the apparent complement. Lee is a training station—forty officers having arrived in the last few days for training purposes, and all machines, except possibly the Shorts, seem to be fitted with dual control.
